REPORT

ON THE

ORIGIN AND SPREAD OF TYPHOID FEVER IN U. S. MILITARY CAMPS DURING THE SPANISH WAR OF 1898

BY

WALTER REED,
Major and Surgeon, U. S. Army,

VICTOR C. VAUGHAN,
Major and Division Surgeon, U. S. Volunteers,

AND

EDWARD O. SHAKESPEARE,
Major and Brigade Surgeon, U. S. Volunteers.

Vol. I.

Prepared, in accordance with act of Congress, under the direction of
Surgeon-General ROBERT M. O'REILLY, United States Army.

WASHINGTON:
GOVERNMENT PRINTING OFFICE.
1904.

683,1

WAR DEPARTMENT,
OFFICE OF THE SURGEON-GENERAL,
Washington, November 1, 1904.

The publication of the complete report of the Board on the Origin and Spread of Typhoid Fever in United States Military Camps During the Spanish War of 1898, by which this vast and valuable collection of data is made available for the profession at large, is largely due to the interest and appreciation of the late honorable Secretary of War, Mr. Root, supplemented by the action of Congress in appropriating the necessary funds.

Since the publication of the abstract the personnel of the board has been still further reduced by the lamented death of Maj. Walter Reed, whose work in this connection together with that of his deceased colleague, has been set forth in such an appreciative manner by the surviving member of the board, Prof. Victor C. Vaughan, of the University of Michigan.

Professor Vaughan, whose special fitness for this work is well known to the medical world, has labored unceasingly to put the full report in such shape as to make it a classic not only for the study of the epidemiologist, but also for the use of the entire medical profession.

I desire to express my appreciation of the successful results of his painstaking and intelligent work.

C. L. HEIZMANN,
Assistant Surgeon-General, U. S. Army,
Acting Surgeon-General.

TABLE OF CONTENTS.

Regimental lists, arranged according to organization.....	Page.
Regimental lists, arranged according to States, alphabetically.....	vii
List of line and staff officers consulted.....	x
Letter of transmittal.....	xiii
Introduction.....	xv

CHAPTER I.

TYPHOID FEVER IN THE FIRST DIVISION OF THE FIRST ARMY CORPS.

	Page.
First Kentucky Volunteer Infantry.....	1
Third Wisconsin Volunteer Infantry.....	9
Fifth Illinois Volunteer Infantry.....	17
Fourth Ohio Volunteer Infantry.....	21
Third Illinois Volunteer Infantry.....	23
Fourth Pennsylvania Volunteer Infantry.....	27
Sixteenth Pennsylvania Volunteer Infantry.....	28
Second Wisconsin Volunteer Infantry.....	32
Third Kentucky Volunteer Infantry.....	38
General remarks concerning typhoid fever in the First Division of the First Corps.....	42

CHAPTER II.

TYPHOID FEVER IN THE SECOND DIVISION OF THE FIRST ARMY CORPS.

Thirty-first Michigan Volunteer Infantry.....	45
One hundred and sixtieth Indiana Volunteer Infantry.....	51
First Georgia Volunteer Infantry.....	57
One hundred and fifty-eighth Indiana Volunteer Infantry.....	62

LETTER OF TRANSMITTAL.

The SURGEON-GENERAL UNITED STATES ARMY.

SIR: I have the honor to forward herewith the report of the board of medical officers convened per Special Orders, No. 194, Adjutant-General's Office, August 18, 1898. An abstract of this report was published by the Government in 1900, and provision for the publication of the complete report was made by act of Congress, March 3, 1903. Mr. Myers, chief clerk, Army Medical Museum, rendered the board valuable assistance in the preparation of tables and charts, and during the summer of 1904 the eminent English epidemiologist, Dr. Christopher Childs, has gone over the greater part of the manuscript and made many wise suggestions. I am greatly indebted to Doctor Childs for his most valuable aid, rendered at great personal sacrifice and prompted solely by his deep and intelligent interest in the subject. If governments ever learn that military campaigns should be conducted in accord with hygienic rules and that the commanding officer who needlessly and ignorantly sacrifices his men to disease is as unworthy of his position as one who makes a like sacrifice in the face of the enemy, it will be through the labors of such men as Doctor Childs.

I am sure that in transmitting this report, the joint production of the three members of the board, it will not be amiss for me to say a few words concerning the labors of my dead comrades. Maj. Edward O. Shakespeare is well known for his many valuable contributions to scientific medicine, and especially for his exhaustive report on Asiatic cholera, which resulted from his study of the disease in Spain and India as special commissioner from the United States Government; also for his brilliant investigation of the outbreak of typhoid at Plymouth, Pa., the report of which has become a classic in the annals of epidemiology. He entered upon and pursued the work assigned to this board with an expenditure of energy and time that did much to shorten his life already placed in jeopardy by the herculean task, self imposed, in the collection of data and the preparation of the cholera report. Although honorably discharged from the service on June 30, 1899, at a time when this report was far from complete, on the ground that the Government had no more money to put into the investigation, Major Shakespeare continued his work in which he had become deeply absorbed, giving all his energy and sacrificing his health until his sudden death on June 1, 1900, the day before the members of the board were to come together to compare the results of their studies and to formulate the general conclusions. Major Shakespeare was eminently fitted for the work of an epidemiologist, to trace effect to cause, and to follow the path blazed by the axe of science wherever it might lead. There was no detail too onerous to cause him to seek a shorter cut. Time and application were never counted when he sought for truth. There was no task too heavy if it promised to lead to a solution of the problem in hand. He was never tempted to generalize until he had mastered every detail. His part of the report covers the Second Army Corps at Camp Meade and the Second Division of the Seventh Army Corps at Jacksonville, and the special problem in which he became so deeply absorbed and to the elucidation of which he gave so much time and energy was the spread of typhoid fever by contact, "tent, squad, or comrade infection," and the preparation of such maps as those of the Fifteenth Minnesota and certain other regiments in the above-mentioned organizations furnish most positive proof that the dissemination of typhoid fever in the military camps in 1898 was most largely from person to person by contact and not through infected water or food. Others have suspected that typhoid might be spread in this way, some have asserted it, especially since the first publication of his work, but Major Shakespeare has demonstrated by a detailed study, which I believe to be without a parallel in the annals of epidemiology, that typhoid fever is as contagious as well as an infectious disease, and that isolation and disinfection are essential procedures in abating certain epidemics of this disease in armies.

Maj. Walter Reed, chairman of the board, was eminently suited for this work. Inasmuch as he alone of the members was a military man, all questions concerning the application of sanitary measures for the abatement of the epidemic in the different camps—and this was quite naturally the primary reason for the creation of the board—were referred to and decided by him. Major Reed was not only the director of the work, but labored most earnestly in the study of scientific detail. As his subsequent investigations on the etiology of yellow fever

demonstrated he was one of the truly great scientists who have contributed to preventive medicine, and his name has been written along with those of Jenner and Pasteur among those who have blessed the race by placing in man's hands the means of self-protection from the most deadly diseases. The careful thought, the rigid logic, the unerring grasp of every detail involved in the conception and execution of his experiments on the transmission of yellow fever show him to have been a man without a superior and with but few equals in the history of science. The problem in the studies of this board, to which Major Reed gave most of his time and attention, was that of the relation to typhoid fever of the short diarrheas and so-called malarias. As may be seen by those who read the report, the statistical evidence that the short diarrheas and so-called malarias gave temporary protection against typhoid fever was very strong. Major Reed frequently expressed regret that he had not the opportunity of applying the Widal test in a number of individuals showing so-called malarias and diarrheas in the midst of a typhoid epidemic. This opportunity came when he was ordered to Cuba to study an outbreak of typhoid in the Eighth United States Cavalry, and, as may be seen from this report, the statistical evidence that these temporary illnesses were actually due to typhoid infection was confirmed by the Widal test.

It was an honor to be associated with these men, and no one knows better than the writer the extent to which this report fails in completeness because he has not had their wise help in preparing the manuscript for publication.

Respectfully,

VICTOR C. VAUGHAN,
Surviving Member of the Board.

INTRODUCTION.

The board was created by the following:

SPECIAL ORDERS, }
No. 194. }

WAR DEPARTMENT,
ADJUTANT-GENERAL'S OFFICE,
Washington, August 18, 1898.

40. A board of medical officers, to consist of Maj. Walter Reed, surgeon, U. S. Army; Maj. Victor C. Vaughan, division surgeon, U. S. Volunteers, and Maj. Edward O. Shakespeare, brigade surgeon, U. S. Volunteers, is appointed to meet in this city at the earliest date practicable for the purpose of making an investigation into the cause of the extensive prevalence of typhoid fever in the various military camps within the limits of the United States, under such instructions as it may receive from the Surgeon-General of the Army. The board will call the attention of the proper commanding officers to any insanitary conditions which may exist at the camps visited by it, and will make recommendations with a view to their proper correction. The report of the board will be forwarded to the Surgeon-General as soon as practicable after the completion of the investigation contemplated.

Such journeys as may be required under the above order are necessary for the public service.

By order of the Secretary of War:

H. C. CORBIN, *Adjutant-General.*

In compliance with these orders the board proceeded immediately to Camp Alger, Va., where the Second Army Corps was then located. Here we found many soldiers in the hospitals sick with continued fever. The members of the board were soon convinced that this illness was typhoid fever, but inasmuch as some of the surgeons in attendance at these hospitals insisted that the disease was malaria, the board returned to Washington and requested the Surgeon-General to place in all the hospitals in the camps in the United States men competent to examine the blood for the malarial parasite and to make the Widal test for typhoid fever. This request was granted, and as will be shown throughout the report it was conclusively demonstrated that the prevailing sickness in the camps in the United States in 1898 was typhoid fever, and that cases of malaria were exceedingly rare.

After spending six days at Camp Alger, and having made a thorough study of the hygienic conditions of the camp, and having placed the examination of the blood in competent hands, the board proceeded to Fernandina, Fla., where the Fourth Army Corps was then encamped. On arriving at this place it was found that this corps was preparing to remove to Huntsville, Ala. However, the board spent two days in examining the camp site, in visiting the hospitals, and in obtaining the medical histories of the regiments from the surgeons. From Fernandina the board went to Jacksonville, Fla., and studied the condition of the Seventh Army Corps. The plan of investigation adopted at this place was as follows: The first two days were given to the question of the existence of typhoid fever among the citizens of Jacksonville and the surrounding country and a study of the water supply. Details will be found in the body of this report, but it may be stated here that there was no epidemic of typhoid either in the city or in the surrounding country, while this disease prevailed most extensively among the soldiers who were drinking the same water as that used by the citizens. Attention was given especially to the possibility of the water at isolated houses outside the city limits and occasionally visited by soldiers being infected with the typhoid bacillus, and it can be stated without reservation that the epidemic of typhoid fever in the Seventh Army Corps was not due to infected water. After having studied local conditions, one or more surgeons from each regiment was summoned and asked to give the medical history of his command and to state his own views concerning the cause of the epidemic. Later, each regiment and each hospital was visited.

The board then followed the Fourth Army Corps to Huntsville, Ala., and studied each regiment individually.

From Huntsville the board went to Chickamauga Park, which had just been vacated by the First and Third Army Corps. Only a few regiments remained at the park at that time and consequently but few surgeons were seen. This accounts for the differences in the methods by which the matter was worked up in these organizations as compared with others. The board made out its reports upon the regiments of the First and Third Army Corps from the monthly sick reports, both regimental and divisional, and submitted these reports to the medical

officers of the regiments for consideration and criticism. This explains the publication in the report of the lists of probable and recognized cases of typhoid fever in the regiments of the First and Third Army Corps. It should be remarked that the statements of the medical officers, although condemned in many places, have not been modified or altered in any material way. When the surgeon has stated that malaria prevailed in his regiment his statement is inserted, and the same is true of his opinion of the cause of the so-called malaria. For instance, it is claimed by the surgeon of one of the regiments that the cause of the malaria at Chickamauga was the high altitude of that camp. It will be understood, however, that the board does not indorse such a statement. In the first place, the board's studies show most convincingly that there were but few cases of malaria at Chickamauga, and if there had been many cases the board could not indorse the opinion that this disease is caused by high altitude.

The site of the encampment of each regiment at Chickamauga, the intake of the water supply, and each well and spring used by the troops were visited and carefully studied by the board. Attention was also given to the three hospitals remaining at that time in the park. General Boynton, long superintendent of the park and perfectly familiar with every part of the grounds, rendered the board most valuable aid in this work.

From Chickamauga the board went to Knoxville, Tenn., to which place one division had gone from Chickamauga. Here the board was given opportunity of studying an isolated regiment, the Fourth Tennessee, which had never been assigned to any larger encampment. At Knoxville, as at Jacksonville, especial attention was given to the water supply. Some days were spent with the local health authorities and no case of typhoid fever could be found among the citizens of West Knoxville, although the soldiers drinking the same water were suffering severely. It can be stated that the division at Knoxville did not owe its typhoid epidemic to water infection at that place.

The board went from Knoxville to Washington, and later to Montauk Point, N. Y., and later still to Camp Meade, at Middletown, Pa. At Montauk Point the board studied the condition of the Fifth Army Corps which had just returned from Cuba. Observations made at this place are not given in the report, because it was thought best to confine the work to camps occupied by soldiers who had not been outside of the United States. It may be stated here that not only typhoid fever but tropical malaria prevailed among the troops that had participated in the Santiago campaign.

At Camp Meade special attention was given to the question of the disinfection of tentage, clothing, and blankets, and it will be seen that after these measures were carried out and this corps moved to a new camp typhoid fever practically disappeared. This leads the board to emphasize the fact that after typhoid fever has become epidemic in a command the only way to get rid of the infection is to disinfect everything and then move to a new site. Change of location alone is not sufficient to rid a command of typhoid infection. The bacillus in the blankets, in the tentage, and clothing must be destroyed. When this is done, all sick left behind, all new cases isolated promptly and a new location secured, the epidemic ceases.

It will be well for those who consult this report to bear in mind that the order in which the matter is presented in the publication does not follow the itinerary of the board in its tour of inspection. The order of visiting the national encampments, with date of arrival at each, was as follows:

1898: August 20, Camp Alger at Dunn Loring, Va., 7 miles west of Washington.

August 26, camp at Fernandina, Fla.

August 28, Camp Cuba Libre at Jacksonville, Fla.

September 7, camp at Huntsville, Ala.

September 10, Camp George H. Thomas at Chickamauga Park, Ga.

September 14, camp at Knoxville, Tenn.

September 30, Camp Meade, near Harrisburg, Pa.

By reference to the order creating and instructing the board it will be found that one of the duties imposed was to call the attention of the proper commanding officers to any insanitary condition which may exist at the camps visited, and to make recommendations with a view to their proper correction. This was done in writing while at each camp, and it has been thought best to reproduce in this report each of these recommendations, although this necessitates considerable repetition, because these written recommendations express the views held by the board at the time of inspection, and each has something in it bearing on the camps that were being studied.

After the inspection of camps had been concluded the board returned to Washington and began a systematic study of the regimental and hospital sick reports. This work was continued until June, 1900, and it is desirable that a general statement of the manner in which it was done should be made, because the validity of the conclusions reached by the board depends upon the thoroughness with which its investigations were carried out. The plan followed was as follows: From the regimental monthly sick reports every name, with rank and company, was copied and arranged alphabetically in order that there should be no confusion of individuals. Each name was followed by the recorded diagnosis and the disposition of the individual. If the sick man was sent to a division

hospital his history was traced through the records of this hospital, and the same plan was carried out with those sent to general military and civil hospitals. The final disposition of the individual was ascertained whenever possible, but it must be admitted that in a considerable proportion of the cases the incompleteness of the record did not permit of this being done. However, in the great majority of the cases it was possible to trace the individual sufficiently to demonstrate that the illness was a protracted fever. This is shown in the long lists of protracted fevers given in connection with many of the regiments of the First and Third Army Corps. The regiment was taken as the unit and the object has been to ascertain the first case of typhoid in each regiment and then to trace the spread of the disease through the command. However, it has not been the sole object of the board to pick out and enumerate cases of recognized and probable typhoid, but the relation of typhoid to diarrhea, so-called malarias, and all cases so variously diagnosed by the medical officers has been investigated. There has been no little hesitancy as to the wisdom of the publication of the long lists of cases appended to the records of some of the regiments of the First and Third Corps. These lists take up much space, but it has been thought best to include them, because they show exactly how the work was done. However, they do not show the extent and thoroughness of the work, because the published lists show, for the most part, only the cases of protracted fever, while the record of every individual whose name occurs on the monthly sick reports has been traced in the same way, it matters not what the diagnosis or duration of the disease was. This was necessary in order to trace the possible relations between temporary or apparently temporary indispositions and subsequent protracted fevers. This has been investigated in detail in some of the regiments, and the conclusion that transient diarrheas not only did not predispose to typhoid, but gave marked immunity to that disease, because they were due to typhoidal infection, is believed to be one of the most important conclusions reached in the investigation.

The time period, as applied to the regiments, over which the investigations of the board continued is variable. It was at first decided to study each regiment from the date of assembly or muster-in until October 31, 1898, but some of the regiments were furloughed in September and there were no records after that time, while others remained in service and some of the latter presented interesting data of sufficient importance to justify following them through November and December. This was especially true of some of the regiments of the Second Army Corps. By the time the board reached the location of this command at Camp Meade the last day of September, the board itself had learned much, and thorough disinfection of this command was carried out under the direction of Colonel Girard, and it was most gratifying to the board to follow these regiments into their Southern encampment and to find that notwithstanding the fact that the season was most opportune for the prevalence of both malaria and typhoid fever, neither of these diseases, nor in fact any other, was manifest during the fall and winter. The board has regarded this as a demonstration that a way of ridding a command of typhoid infection has been found. It may be interesting to state in this connection that the inspection of camps had a most decided influence on the opinions of the board. They went to Camp Alger believing that they would find some evidence of water infection, but a careful study of the conditions there led to the suggestion that there might be other agencies quite as efficient in the spread of typhoid as water. The study of the conditions prevalent at Jacksonville convinced the board that there at least water was not responsible for the epidemic; then the inspection of the recently abandoned camps at Chickamauga plainly told the truth, and the fact that the most potent factor in the spread of typhoid fever in the camps was the pollution of the soil, of the feet, clothing, bedding, tentage, etc., was made evident, and the necessity for disinfection was pointed out in a way that could not be misunderstood.

In 32 regiments of the Second Army Corps and in 16 regiments of the Seventh Army Corps we have traced the subsequent history of every enlisted man having a short diarrhea or supposed mild malarial attack, in order to see whether these individuals afterwards showed any immunity to typhoid fever. Having endeavored to ascertain with every degree of accuracy within our power the number of cases of typhoid fever in 118 regiments, we found that the data were more or less incomplete in 20. Of the remaining 98 regiments we have charted by company and regiment 84. In 60 of these regiments all cases of typhoid fever, all short and long so-called malarias, and all diarrheas are indicated on the charts according to the date of their occurrence. Of the remaining 24 regiments only cases of typhoid fever are charted.

Bearing on the possibility of infection by personal contact, we have endeavored to locate by tents and in the order of their occurrence every case of typhoid fever which developed in a number of regiments of the Second and Seventh Army Corps, especially in the Fifteenth Minnesota, Thirty-fifth Michigan, Two hundred and third and Two hundred and first New York, and Second New Jersey Volunteer Infantry. These data were furnished largely by the medical officers of these regiments, and in part by the captains of 15 companies of regiments belonging to the Second and Seventh Corps.

It will be readily seen that in prosecuting this work we have assumed a task not only of great magnitude but one beset with many difficulties. The incompleteness of regimental medical records, the changes in the

spelling of names, the giving of wrong initials, and the failure to state rank and company have given us no end of trouble. However, we have spared no pains and we believe that we have not duplicated cases. In the case of men who were furloughed we have carefully searched the reports of mustering-out officers; and in ascertaining the names of those who have died and the cause of death we have resorted to the records of the Adjutant-General's Office. Many men were sent home on hospital trains and were distributed in civil hospitals throughout the country. The medical officers of these hospitals have, as a rule, been kind enough to send us detailed reports giving the name, regiment, rank, company, diagnosis, and termination of each case. In a few instances hospital officials have refused to make such reports, hence we have not secured reports from all the civil hospitals. However, in some of these institutions in which the superior officers have refused to supply us with the desired information, physicians in immediate charge of patients have, at considerable sacrifice of time, made out the desired lists for us. To all of these we wish to express our warmest thanks. We are particularly indebted to Maj. David C. Peyton, surgeon, U. S. Volunteers, for complete reports of sick from the various State and city hospitals of Pennsylvania.

Having ascertained when the first case of typhoid fever appeared in each regiment, we have endeavored to trace the progress of the disease and to account when possible for its spread. Especial attention has been given to the effects of the movements of regiments, the sites of camps, the water supply, and the disposition of fecal matter upon the spread of the disease.

It will be seen that we speak of "recognized" or "certain" and "probable" cases of typhoid fever. The recognized or certain cases need no comment nor explanation. By "probable" we refer to cases which were not recognized by any of the military medical officers as typhoid fever, but which we believe to have been cases of this disease. We have kept these two classes distinct in order that our statistics may not be vitiated by our own ideas. When we began the inspection of camps and hospitals we soon saw that many medical officers were, in our opinion, failing in the recognition of typhoid fever. As has been stated, we asked the Surgeon-General to send to each encampment an expert properly equipped to make blood examinations for the plasmodium of malaria and to apply the Widal test for typhoid fever. It is to be regretted that these examinations were not begun earlier. However, we have been able through these experts to clear up the diagnosis in a large proportion of the cases. In many places our report will apparently be a reflection upon the professional skill of the medical officers. This reflection is, however, more apparent than real. We wish to testify to the fact that the medical officers, both in the volunteer and the regular service, were men of more than average professional ability. It is true that weak men were found in both lines of service, but these were the exceptions and not the rule. The fact that so large a number of most competent medical men left their remunerative practice to devote their time and energy to the service of their country, with most inadequate compensation, must always be accounted to the credit of our profession. In extenuation of the fact that medical officers failed to recognize many cases of typhoid fever, it must be said that the regimental medical officer had the majority of these cases under observation for so short a time that with the means at his command it was quite impossible in a large percentage of the cases to make a positive diagnosis. The rules required that all cases of sickness of forty-eight hours' duration should be sent to the division hospital. This rule is a wise one, and it is unfortunate that it was not always obeyed. It is undoubtedly true that typhoid fever was often spread through a regiment by keeping cases of this disease in quarters or in regimental hospitals, where provision for the disinfection of stools and the care of patients were wholly inadequate, to say nothing of the fact that the time of the regimental medical officer was so occupied with matters pertaining to camp sanitation and with the care of numerous cases of temporary illness that he was not able to give sufficient attention to those sick with typhoid fever. Moreover, regimental medical officers were frequently detached from their commands and placed on duty in division hospitals or elsewhere.

It will be seen from figures to be given later, in which we compare the mortality from typhoid fever in the Army with that from the same disease in civil practice, that the army surgeon in his failure to recognize all cases of typhoid fever showed no greater incapacity than that which is daily shown by physicians in many of the larger cities in our country.

In our list of "probable" cases of typhoid fever it is to be presumed that we have included a few which were not actually cases of this disease. However, we think that the death rate among the cases of probable typhoid fever shows that we have not overestimated the number. Be this as it may, we have endeavored to give every fact that we could obtain concerning each case. We have sought to make this report a full and complete statement of facts, from which we have drawn certain conclusions. The facts are placed before the reader; these he must accept. With our conclusions he may agree or he may draw others to suit himself. In endeavoring to state all the facts, we have made this report somewhat voluminous, but we think we have been justified in doing this. Our sole endeavor has been to get as near the absolute truth as possible.

CHAPTER I.

TYPHOID FEVER IN THE FIRST DIVISION OF THE FIRST ARMY CORPS.

FIRST KENTUCKY VOLUNTEER INFANTRY.

First Brigade, First Division, First Army Corps.

This regiment was mustered into service at Camp Bradley, Lexington, Ky., June 5, 1898. It remained here until June 10, when it departed for Chickamauga Park, Ga., arriving June 11, 1898.

The first report covers the period from June 10 to June 30.

CONDENSED SICK REPORT FROM JUNE 10 TO JUNE 30.

Mean strength	1,314
Intermittent malaria	3
Acute diarrhea	2
Dysentery	2
Enteritis	3
Other diseases	9
Total	19

It seems that this command had a regimental hospital, which was opened June 12.

The June report is signed by Ellis Duncan, captain and assistant surgeon.

The July report is signed by Captain Duncan, who makes the following remarks:

Headquarters, staff, and three battalions of four companies each were in camp at Chickamauga Park, Ga., until July 26. It was en route to Newport News, Va., July 27 and 28, arriving at Newport News, July 28. It remained in camp here during the remainder of this month. Many patients were transferred to the division hospital and subsequently removed from the division hospital to the general hospital on hospital trains. These cases were not reported to the regimental adjutant or regimental surgeon, hence records of such cases are incomplete.

CONDENSED SICK REPORT FOR JULY.

Quarters	14

The August report is signed by J. B. Palmer, major and surgeon, who makes the following remarks:

Lieut. Col. M. B. Belknap, with detachment of six companies, F, H, I, K, L, and M, left Newport News August 1, arriving at Ponce, P. R., August 8; were then sent to Mayaguez, arriving August 10. The hospital was arranged in the barracks; Capt. Ellis Duncan, assistant surgeon, was placed in charge. Col. J. B. Castleman, with detachment of six companies, A, B, C, D, E, and G, left Newport News August 9, arriving at Ponce, P. R., August 16. A hospital was erected near port of Ponce, with Maj. J. B. Palmer, surgeon, and Capt. J. K. Freeman, assistant surgeon, attending. This report contains record of the sick of both detachments. The first detachment marched from Mayaguez August 28, arriving at Ponce August 30. The whole regiment is now in camp about 5 miles to the north of Ponce.

There is a special report for the detachment which was stationed at the military hospital at Mayaguez from August 13 to 31.

This report is as follows:

Mean strength, not given.	
Admissions from command	5
Total to be accounted for	5
Died	1
Otherwise disposed of	4
Completed cases	5

This report is signed by P. R. Egan, major and brigade surgeon, U. S. Volunteers, in command of the hospital. Major Egan makes no comments.

The September report is signed by Captain Duncan, who makes the following remarks:

The regimental field hospital was located near Ponce during the entire month, Capt. Ellis Duncan, assistant surgeon, being in attendance. Company G was detached and served as mounted infantry on duty at and around Ciales. Capt. J. K. Freeman, assistant surgeon, attended this detachment. Company M was on detached duty as provost guard in Ponce. William R. Kirk, acting assistant surgeon, accompanied this detail. Maj. J. B. Palmer, surgeon of the regiment, was detached and placed in charge of the general hospital at Coamo.

Transferred to other hospitals	67
Completed cases	185
Remaining on sick report:	
Hospital	28
Quarters	1

There is a special report for Company G. This report covers the period from September 18 to 30. Capt. John K. Freeman, in charge, makes the following remarks:

September 18, 1898, Company G, First Kentucky Volunteer Infantry, mounted, was ordered to Utuado for scout duty under orders of Colonel Rice, Sixth Massachusetts Volunteer Infantry. The order gave instructions to report back to the First Kentucky Regiment at Camp Wilson, near Ponce, within ten days. This order was extended September 25 for another ten days. On October 1 the company was ordered to Ciales. Headquarters were established at Utuado. A company was sent out into the neighboring country. The road from Utuado to Arecibo was patrolled to within 4 miles of Arecibo. The health of the company has been excellent.

Private Butler was shot and mortally wounded by Spanish soldiers while guarding a plantation about 4 miles south of Arecibo. The accident grew out of a misunderstanding between the American and Spanish soldiers. Both were at that time guarding property in that neighborhood.

Condensed sick report for Company G.

Mean strength	84
Died	1
Completed cases	1

In the October report the surgeon makes the following statement:

Eight companies of the First Kentucky Volunteer Infantry have been acting as provost guard in Ponce. Company G left camp for Utuado September 19 and did not return to camp during October. Capt. John K. Freeman, assistant surgeon, attended this company. Company E left camp for Cagüas October 13 and has not returned. This company has been without a surgeon. Company F left camp for Cayey October 13 and has not returned. This company was also without a surgeon. Company M left camp for Las Marias October 13 and has not returned. Doctor Hughes, acting assistant surgeon, attended this company. Companies I, K, and L are in barracks at Ponce. Drs. W. R. Kirk and W. A. Carson, acting assistant surgeons, are with these companies. Companies A, B, and D are in other barracks in Ponce. Doctor Kirk has attended these companies also. Companies C and H are in still other barracks in Ponce. Doctor Kirk is in attendance upon these also. The regimental hospital is at Camp Wilson, near Ponce. Doctor Kirk is in attendance. Major Palmer returned from general hospital at Coamo October 28 and took charge of the companies in Ponce.

A special report for Company G for October is signed by Capt. John K. Freeman, who makes the following remarks:

Company G, First Kentucky Volunteer Infantry, mounted, marched from Utuado to Ciales October 1 and 2. Detachments from these companies scouted the vicinity of Ciales and occupied Morovis, Crozal, Naranjito, and Ciales. Headquarters have been established at Ciales. The health of the company is good. Medical supplies were inadequate, as no supplies could be drawn from the regular medical supply depot. Some medicine was ordered of local druggists at Ciales and Crozal. A native physician attended the sick at Crozal.

The following is a list of the cases of protracted fever in this regiment:

A.—At Chickamauga, Ga.

No. 1. Company B: Intestinal fever, June 19; still sick in division hospital June 30.

No. 2. Company A: Diarrhea, June 25; still sick in division hospital July 31.

No. 3. Company I: Typhoid fever, June 28; sent to Fort Thomas July 6.

No. 4. Company D: Enteritis, June 29 to July 10.

No. 5. Company F: Enteritis, July 1; still sick in Leiter Hospital July 31.

No. 6. Company A: Typhoid fever, July 2; still sick in Leiter Hospital July 31.

No. 7. Company I: Typhoid fever, July 2; sent to Leiter Hospital July 5.

No. 8. Company E: Typhoid fever, July 4; sent to division hospital July 5.

No. 9. Company A: Typhoid fever, July 7; sent to Leiter Hospital July 8.

No. 10. Company E: Typhoid fever, July 8; sent to division hospital July 20.

No. 11. Company B: Typhoid fever, July 9; sent to Leiter Hospital July 10.

No. 12. Company B: Typhoid fever, July 9; sent to division hospital July 9. This man was furloughed from division hospital and returned from furlough still sick with typhoid fever. He was sent to Fort Thomas September 8, and was discharged September 23.

No. 13. Company C: Typhoid fever, July 11; furloughed July 12. Apparently this man returned from furlough, went to Porto Rico, and was sent home on the *Relief*. He was sent to the general hospital at Fortress Monroe November 26, where the disease was diagnosed typhoid fever, and he was furloughed December 2. It would appear from this that he had two attacks of typhoid fever.

No. 14. Company C: Typhoid fever, July 15; sent to division hospital July 18; furloughed August 25.

No. 15. Company H: Typhoid fever, July 15; sent to division hospital July 18; furloughed September 6.

No. 16. Company A: Malaria, July 16; sent to division hospital July 31.

No. 17. Company E: Typhoid fever, July 18; sent to division hospital July 20; transferred to Fort McPherson without date; sent from Fort McPherson to Fort Thomas September 7.

No. 18. Company D: Typhoid fever, July 19; sent to division hospital July 20; returned to duty September 6.

No. 19. Company A: Typhoid fever, July 22; sent to division hospital July 22.

No. 20. Company G: Typhoid fever, July 23; sent to division hospital July 26.

No. 21. Company M: Typhoid fever, July 23; sent to division hospital July 24.

No. 22. Company A: Typhoid fever, July 25; sent to division hospital July 25.

B.—At Newport News, Va.

No. 23. Company C: Typhoid fever, July 30; sent to Fortress Monroe August 1.

No. 24. Company C: Typhoid fever, July 30; sent to Fortress Monroe August 1.

No. 25. Company L: Typhoid fever, July 30; sent to Fortress Monroe August 1.

No. 26. Company M: Typhoid fever, July 30; sent to Fortress Monroe August 1.

No. 27. Company B: Gastritis, August 1; still sick August 31.

No. 28. Company G: Typhoid fever, August 1; sent to Fortress Monroe August 1; transferred to Fort Thomas September 7; returned to duty September 23.

No. 29. Company M: Typhoid fever, August 3; sent to brigade hospital at Mayaguez August 25.

C.—After leaving Newport News, Va.

No. 30. Company I: Typhoid fever, August 4; placed on *Relief* August 10.

No. 31. Company K: Malaria, August 4; sent north on *Relief* August 15.

No. 32. Company L: Typhoid fever, August 4; sent home on *Relief* August 5.

No. 33. Company L: Typhoid fever, August 7; sent home on *Relief* August 5.

No. 34. Company F: Typhoid fever, August 7; sent home on *Relief* August 5.

No. 35. Company A: Typhoid fever, August 7; sent to Fortress Monroe August 9.

No. 36. Company A: Typhoid fever, August 7; sent to Fortress Monroe August 9.

No. 37. Company M: Typhoid fever, August 8; placed on *Relief* August 10.

No. 38. Company H: Typhoid fever, August 8; placed on *Relief* August 10.

No. 39. Company I: Typhoid fever, August 9; placed on *Relief* August 15.

No. 40. Band: Intermittent malaria, August 9; sent to general hospital at Ponce August 21.

No. 41. Company K: Typhoid fever, August 15; sent to hospital at Mayaguez August 25; transferred to hospital ship August 31.

No. 42. Company M: Typhoid fever, August 16; died August 19.

No. 43. Company H: Typhoid fever, August 17; sent to brigade hospital at Mayaguez August 25; transferred to hospital ship August 31; still sick in hospital in Philadelphia October 31.

No. 44. Company M: Typhoid fever, August 19; sent to brigade hospital at Mayaguez August 25; transferred to hospital ship August 31.

No. 45. Company D: Typhoid fever, August 19; sent to general hospital at Ponce August 21.

No. 46. Company A: Typhoid fever, August 19; sent to general hospital at Ponce August 20; transferred to the *Missouri* without date; sent to general hospital at Fortress Monroe October 5; still sick in general hospital December 10.

No. 47. Company B: Remittent malaria, August 20; sent to general hospital at Ponce August 21.

No. 48. Company E: Remittent malaria, August 20; sent to general hospital at Ponce August 21.

No. 49. Company K: Typhoid fever, August 20; disposition not given.

No. 50. Company B: Remittent malaria, August 22; sent to general hospital at Ponce August 23; sent to hospital in Philadelphia September 5. Here the disease was diagnosed typhoid fever, and the patient was discharged October 29.

No. 51. Company A: Remittent malaria, August 23; sent to general hospital at Ponce August 24.

No. 52. Company A: Typhoid fever, August 23; sent to general hospital at Ponce August 27.

No. 53. Company D: Remittent malaria, August 23; placed on *Relief* August 31.

No. 54. Company M: Remittent malaria, August 23; placed on *Relief* August 31.

No. 55. Company M: Typhoid fever, August 23; placed on *Relief* August 31.

No. 56. Company B: Malaria, August 24; sent to general hospital at Ponce September 1.

No. 57. Company F: Remittent malaria, August 30; sent to general hospital at Ponce September 1.

No. 58. Company C: Intermittent malaria, September 1 to 20.

No. 59. Company F: Intermittent malaria, September 1 to 18.

No. 60. Company B: Intermittent malaria, September 2; still sick September 30.

No. 61. Company B: Intermittent malaria, September 2 to 17.

No. 62. Company G: Typhoid fever, September 2; sent to general hospital at Ponce September 4. Later this man was transferred to a hospital in Philadelphia where he was still sick October 31.

No. 63. Company H: Typhoid fever, September 2; sent to general hospital at Ponce September 4.

No. 64. Company M: Typhoid fever, September 2; sent to general hospital at Ponce September 4.

No. 65. Company A: Intermittent malaria, September 3 to 30.

No. 66. Company B: Remittent malaria, September 3; still sick September 30.

No. 67. Company E: Remittent malaria, September 3; still sick in general hospital at Ponce September 30.

No. 68. Company E: Enteritis, September 3 to 22.

No. 69. Company E: Remittent malaria, September 3; still sick in hospital at Ponce September 30.

No. 70. Company M: Remittent malaria, September 3; still sick in hospital at Ponce September 30.

No. 71. Company E: Remittent malaria, September 4; sent to general hospital at Ponce September 7. On October 24 this man was sent to Fort Thomas with remittent malaria and was discharged December 21. In all probability this was a case of malaria.

No. 72. Company L: Intermittent malaria, September 4 to 29.

No. 73. Company L: Intermittent malaria, September 4; sent to general hospital at Ponce October 1.

No. 74. Company M: Remittent malaria, September 4; sent to hospital at Ponce September 7.

No. 75. Company M: Remittent malaria, September 4; sent to hospital at Ponce September 10.

No. 76. Company A: Remittent malaria, September 5; sent to hospital at Ponce September 7.

No. 77. Company K: Intermittent malaria, September 5; sent to general hospital at Ponce September 7. This man was transferred to Fortress Monroe November 19, and was discharged December 10.

No. 78. Company E: Typhoid fever, September 5; sent to general hospital at Ponce September 15.

No. 79. Company E: Remittent malaria, September 5; sent to general hospital at Ponce September 15; transferred to Fortress Monroe October 5. Here the disease was diagnosed typhoid fever, and the patient was furloughed November 10.

No. 80. Company F: Malaria, September 5; sent to general hospital at Ponce September 10.

No. 81. Company F: Intermittent malaria, September 5 to 18.

No. 82. Company I: Remittent malaria, September 5; sent to general hospital at Ponce September 7; transferred to Philadelphia October 5. Here the diagnosis of remittent malaria was continued, and the patient was furloughed October 19.

No. 83. Company L: Remittent malaria, September 5; sent to general hospital at Ponce September 15.

No. 84. Band: Diarrhea, September 5 to 19.

No. 85. Company C: Remittent malaria, September 6; sent to general hospital at Ponce September 10; transferred to Philadelphia October 5. Here the diagnosis of remittent malaria was continued, and the patient was furloughed October 19.

No. 186. Company C: Typhoid fever, October 25; sent to general hospital at Ponce October 27.

No. 187. Company I: Diarrhea, October 25; sent to general hospital at Ponce October 28; sent to Fortress Monroe November 26. Here the disease was diagnosed typhoid fever, and the patient was discharged December 29.

No. 188. Company G: Remittent malaria, October 25; sent to San Juan October 27.

No. 189. Company L: Remittent malaria, October 26; still sick November 30.

No. 190. Company I: Remittent malaria, October 27; sent to general hospital at Ponce October 28.

No. 191. Company K: Remittent malaria, October 28; sent to general hospital at Ponce October 28.

No. 192. Company B: Intermittent malaria, October 29; still sick November 30.

No. 193. Company I: Intermittent malaria, October 30; still sick November 30.

No. 194. Company I: Diarrhea, October 31; still sick November 30.

No. 195. Company L: Remittent malaria, October 31; still sick November 30.

No. 196. Company B: Remittent malaria, November 1 to 24.

No. 197. Company C: Remittent malaria, November 1 to 23.

No. 198. Company K: Intermittent malaria, November 1 to 13.

No. 199. Company C: Intermittent malaria, November 1; sent home on hospital ship *Berlin* November 1.

No. 200. Company A: Remittent malaria, November 1; sent home on hospital ship *Berlin* November 1.

No. 201. Company B: Typhoid fever, November 1; sent home on hospital ship *Berlin* November 1.

No. 202. Company A: Remittent malaria, November 1; sent home on hospital ship *Berlin* November 1.

No. 203. Company C: Remittent malaria, November 1; sent home on hospital ship *Berlin* November 1.

No. 204. Company K: Diarrhea, November 2; sent to general hospital at Ponce November 7.

No. 205. Company L: Diarrhea, November 2 to 17.

No. 206. Company D: Diarrhea, November 3; sent to general hospital at Ponce November 7; sent to Philadelphia November 26. Here the diagnosis was changed to malaria, and the patient was still sick December 10.

No. 207. Company H: Intermittent malaria, November 11; sent to officers' hospital at Ponce without date.

No. 208. Company C: Diarrhea, November 12 to 17.

No. 209. Company H: Remittent malaria, November 17; sent to general hospital at Ponce November 17.

No. 210. Band: Remittent malaria, November 21; sent to general hospital at Ponce November 21.

No. 211. Company K: Intermittent malaria, November 25; still sick November 30.

No. 212. Band: Remittent malaria, November 26; sent to general hospital at Ponce November 26.

No. 213. Company B: Intermittent malaria, November 28; still sick when the regiment left Porto Rico.

No. 214. Company K: Intermittent malaria, November 28; still sick when the regiment left Porto Rico.

No. 215. Company K: Remittent malaria, November 28; still sick when the regiment left Porto Rico.

No. 216. Company L: Remittent malaria, November 28; still sick when the regiment left Porto Rico.

No. 217. Company B: Intermittent malaria, November 30; still sick when the regiment left Porto Rico.

No. 218. Company A: Intermittent malaria, December 1; sent to City Hospital at Louisville December 12.

No. 219. Company not given: Intermittent malaria, December 2; sent to City Hospital at Louisville December 12.

No. 220. Company G: Remittent malaria, December 2; sent to City Hospital at Louisville December 12.

No. 221. Company E: Intermittent malaria, December 2; sent to City Hospital at Louisville December 12.

No. 222. Company E: Intermittent malaria, December 2; sent to City Hospital at Louisville December 12.

No. 223. Company I: Convalescing from typhoid fever, December 4; disposition not given.

No. 224. Company I: Intermittent malaria, December 4; sent to City Hospital at Louisville December 12.

No. 225. Company I: Intermittent malaria, December 5; sent to City Hospital at Louisville December 13.

No. 226. Company L: Intermittent malaria, December 6; sent to City Hospital at Louisville December 12.

No. 227. Company B: Intermittent malaria, December 8; sent to general hospital at Fortress Monroe December 10.

No. 228. Company M: Intermittent malaria, December 8; sent to Fortress Monroe December 10.

No. 229. Company B: Intermittent malaria, December 8; sent to hospital at Fortress Monroe December 10.

No. 230. Company A: Intermittent malaria, December 8; sent to general hospital at Fortress Monroe December 10.

No. 231. Company F: Remittent malaria, December 8; sent to general hospital at Fortress Monroe December 10.

No. 232. Company M: Remittent malaria, December 10; sent to general hospital at Fortress Monroe December 10.

No. 233. Company C: Intermittent malaria, December 14; sent to City Hospital at Louisville December 14.

No. 234. Company D: Intermittent malaria, December 14; sent to City Hospital at Louisville December 14.

Besides the above, the following are cases from this regiment that were sent to hospitals in the United States and whose names do not appear on the records sent from Porto Rico:

No. 235. Company B: Typhoid fever, September 3; still sick October 14.

No. 236. Company M: Malaria, October 8; furloughed from Philadelphia October 19.

No. 237. Company B: Malaria, August 30; discharged September 18.

No. 238. Company D: Malaria, October 5; still sick November 3.

No. 239. Band: Malaria, November 26; still sick December 10.

No. 240. Company F: Dysentery, November 26; discharged from hospital December 6.

No. 241. Company I: Malaria, October 26; still sick in hospital October 31.

No. 242. Company G: Malaria, October 25; still sick December 10.

No. 243. Company M: Malaria, October 5; furloughed from hospital October 19.

No. 244. Company M: Malaria, October 5; still sick in hospital November 3.

No. 245. Company B: Malaria, August 30; still sick September 15.

No. 246. Company H: Typhoid fever, October 23; still sick at Fortress Monroe December 10.

No. 247. Company C: Typhoid fever, October 26; still sick at Fortress Monroe December 10.

No. 248. Company C: Typhoid fever, October 27; still sick at Fortress Monroe December 10.

No. 249. Company B: Typhoid fever, October 21; furloughed from Fortress Monroe December 4.

No. 250. Company I: Typhoid fever, September 1; discharged from Fortress Monroe November 10.

No. 251. Company I: Typhoid fever, October 5; still sick at Fortress Monroe December 10.

No. 252. Company D: Typhoid fever, October 31; discharged from Fortress Monroe December 10.

No. 253. Company F: Typhoid fever, September 17; discharged from Fortress Monroe November 10.

No. 254. Company I: Typhoid fever, September 6; discharged from Fortress Monroe November 10.

No. 255. Company D: Typhoid fever, September 18; discharged from Fortress Monroe November 3.

No. 256. Company I: Typhoid fever, October 7; discharged from Fortress Monroe December 4.

No. 257. Company K: Typhoid fever, October 31; discharged from Fortress Monroe December 10.

No. 258. Company D: Typhoid fever, October 22; discharged from Fortress Monroe December 29.

No. 259. Company D: Typhoid fever, November 6; still sick at Fortress Monroe December 31.

No. 260. Company A: Typhoid fever, August 26; discharged from Fort Thomas September 23.

No. 261. Company M: Typhoid fever, September 10; discharged from Fort Thomas September 23. This man evidently had been sick elsewhere and had been transferred to Fort Thomas.

No. 262. Company H: Typhoid fever, November 11; discharged from Fort Thomas November 23. This man had been taken ill at Chickamauga—date not given.

SUMMARY.

Assembled at Camp Bradley, Lexington, Ky.	
Mustered into United States service June 5, 1898.	
Reached Chickamauga Park, Ga., June 11, 1898.	
Mean strength on arrival, 1,314.	
Date of first case of probable typhoid fever, June 19, 1898.	
Date of first case of recognized typhoid fever, June 28, 1898.	
Left Chickamauga Park, July 26, 1898.	
Strength at departure, 1,318.	
Number of cases of probable typhoid fever developed at Chickamauga	22
Arrived at Newport News, Va., July 28, 1898.	
Left Newport News:	
(a) Six companies (F, H, I, K, L, and M) August 1.	
(b) Six companies (A, B, C, D, E, and G) August 9.	
Number of cases of probable typhoid fever developed in the regiment at Newport News	7
Reached Porto Rico:	
(a) First detachment, August 8, 1898.	
(b) Second detachment, August 16, 1898.	
Number of cases developed during the voyage to Porto Rico:	
(a) In first detachment	6
(b) In second detachment	0
Number of cases of protracted fever developed in the regiment in Porto Rico:	
During August	19
During September	80
During October	59
During November	24
From December 1 to 6	8
Left Porto Rico December 6, 1898.	
Arrived at Newport News, Va., December 10, 1898.	
Protracted fevers developed during return voyage	6
Protracted fevers developed after reaching United States	3
Total cases found reported in regimental records	234
Additional cases found in hospital records but not given in regimental records	28
Total cases of protracted fever reported in this regiment.	262

These 262 cases of protracted fever reported in this regiment were diagnosed as follows:

Typhoid fever	88
Malaria	147
Diarrhea	16
Intestinal fever	1
Enteritis	3
Gastritis	2
Dysentery	5
Total	262

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Ackerville, Wm. F.	Pvt., E.	Nov. 10 1898.	Louisville, Ky.	Erysipelas.
Anderson, Joseph	Pvt., I.	July 11	Leiter Hospital, Ga.	Typhoid.
Amyx, Huston S.	Pvt., A.	Oct. 19	Ponce, P. R.	Do.
Bailey, Homer M.	Pvt., B.	Oct. 26	do	Do.
Butler, George C.	Pvt., G.	Sept. 27	Arecibo, P. R.	Wounds.
Brooks, Jesse N.	Pvt., K.	Aug. 27	Rio Grande River, P. R.	Drowned.
Close, Richard	Pvt., M.	Aug. 19	do	Typhoid.
Cole, Marshall	Pvt., C.	Oct. 7	Ponce, P. R.	Do.
Cox, Vincent T., jr.	Pvt., C.	Oct. 25	do	Do.
Clare, Richard	Pvt., M.	Aug. 29	Mayaguez, P. R.	Do.
Dean, Stonewall J.	Pvt., H.	Oct. 27	Philadelphia, Pa.	Do.
Demarce, Harry N.	Pvt., A.	Aug. 21	do	Do.
Davis, George B.	Corpl., I.	Dec. 1	San Juan, P. R.	Do.
Farmer, Frank W.	Pvt., I.	Sept. 29	Ponce, P. R.	Do.
Ganote, Wm. J.	Pvt., B.	Jan. 28 1899.	Okolona, Ky.	Paralysis of heart.
Hanlon, Peter	Pvt., K.	Dec. 24 1898.	Louisville, Ky.	Dysentery.
Haskell, Edward T.	Pvt., G.	Jan. 2 1899.	do	Pneumonia.
Hess, David	Pvt., G.	Feb. 6	Morgansville, Ky.	Cerebro-spinal meningitis.
Hooke, Frank T.	Pvt., E.	Dec. 23 1898.	Louisville, Ky.	Pneumonia.
Johnson, Harry P.	Pvt., E.	Nov. 1	Cayey, P. R.	Gastritis, acute.
Jones, John W.	Pvt., L.	Oct. 23	Ponce, P. R.	Typhoid.
Krell, Harry C.	Sgt., K.	Sept. 7	San German, P. R.	Do.
Ott, George L.	Pvt., M.	Sept. 22	Ponce, P. R.	Do.
Parsons, Horace S.	Pvt., E.	Jan. 21 1899.	Louisville, Ky.	Do.
Rowley, Harry M.	Sgt., C.	Dec. 27 1898.	do	Tropical dysentery.
Reynolds, Frank	1stsgt., D.	Oct. 28	Ponce, P. R.	Typhoid.
Simons, Joseph L.	Pvt., D.	Aug. 30	do	Do.
Sands, Joseph H.	Pvt., B.	Dec. 29	Simpson Hospital, Va.	Do.

Total deaths	28
Deaths due to typhoid fever	18

Percentage of deaths among cases of protracted fever (262), 6.87.

Percentage of deaths figured on recognized cases of typhoid fever (88), 20.45.

COMMUNICATIONS FROM THE SURGEONS OF THE FIRST KENTUCKY VOLUNTEER INFANTRY.

Medical officers.

Jack B. Palmer, major and surgeon, Louisville, Ky.

John K. Freeman, captain and assistant surgeon, Louisville, Ky.

Captain Freeman makes a statement from which we abstract the following:

The site at Lexington, Ky., was well drained, covered with thick blue-grass sod, and supplied with water from a cistern and wells on the ground. A portion of the water was obtained from the Lexington supply. The sinks were about 300 yards from the camp. They were dug to a depth of about 8 feet. Every morning straw was thrown in and burned. After this, enough earth was added to keep everything dry. The kitchens were about 200 yards from the sinks. All garbage was kept in barrels and removed three times a day.

At Chickamauga the tents were pitched in the northern part of the park. The streets were covered with gravel. Each battalion dug a sink from 300 to 400 yards east of the tents. Sinks were dug about 10 feet deep, sheltered with boards, and the contents were covered every morning with sufficient earth to keep everything dry. As soon as a sink was filled it was abandoned and a new one dug. The kitchens were well kept. All slops were thrown into kitchen sinks, and the garbage was burned. The water supply was obtained from wells and from Chickamauga Creek.

From Chickamauga the regiment moved to Newport News, Va., preparatory to embarking for Porto Rico. It camped at the mouth of the James River near the city. This camp was without shade or grass, hot and sandy. Men were quartered in shelter tents. Sinks were dug north of the camp, but quite near, on account of lack of space. They received the same attention as they did at Chickamauga. On August 1 this camp was broken, half of the regiment embarking on the transport *Hudson*, while the remainder moved into a little park within the city. The second portion of the regiment left Newport News August 9 and arrived at Ponce, P. R., August 16. Here it occupied a camp about 1 mile from the plaza for two days. This was on swampy land and the mosquitoes were almost unbearable. Little care was given to the sinks in this camp. Water was obtained from an aqueduct which supplies the city of Ponce. Two days later the regiment was moved to the hills north of Ponce. At this place the camp was arranged especially for the comfort of the men. Sinks were dug several hundred yards from the tents and kept in good condition. The kitchen garbage was buried. The tents were floored after the regiment had been encamped for about three weeks. No tents were ditched at any time. The two halves of the regiment were not united until August 29, when the detachment which first went to Porto Rico joined the second detachment on the hills near Ponce. After this the whole regiment remained here until September 18, when four companies were mounted and sent into the interior. The remaining eight companies were later quartered in such houses as could be rented in the city of Ponce for that purpose. The houses were comfortable and the men not crowded. Here the ordinary privy vaults were used.

THIRD WISCONSIN VOLUNTEER INFANTRY.

First Brigade, First Division, First Army Corps.

In the May report of this regiment, Maj. John B. Edwards, surgeon, makes the following statement:

The health of the command has been very good. The diseases have been principally diarrhea and other digestive disturbances, with some affections of the respiratory tract, due in the main to the change in the manner of living and the heat.

CONDENSED SICK REPORT FROM MAY 11 TO 31, INCLUSIVE.

Mean strength	1,024
Diarrhea.....	27
Dysentery.....	6
Other diseases.....	81
Total	114

In the June report Major Edwards makes the following statement:

There has been no material difference in the health of this command during the months of May and June. The command being larger and the result of vaccination have both contributed to swell the number of reported cases. Several cases of typhoid fever developed during June. I was unable to determine its origin.

CONDENSED SICK REPORT FOR JUNE.

Mean strength	1,119
Typhoid fever.....	6
Malaria.....	20
Diarrhea.....	16
Dysentery.....	4
Enteritis.....	1
Other diseases.....	59
Total	106

In the July report, Major Edwards states as follows:

This command left Camp Thomas, Chickamauga Park, Ga., July 5, 1898, for Charleston, S. C. Quite a number of cases of typhoid fever had developed and were occurring at that time. All sick were left behind. The quarters in Charleston were not the best from a sanitary point of view. A number of typhoid fever cases occurred there between the 6th of July, the date of our arrival, and the 20th of July, the date of our departure. Quite a large number of malarial cases developed during the same time.

July 20 this command sailed for the island of Porto Rico and arrived and disembarked at Ponce July 27 and 28. Some cases, both typhoid and malaria, developed on board ship.

CONDENSED SICK REPORT FOR JULY.

Mean strength	1,318
Typhoid fever.....	15
Malaria.....	22
Undetermined fever.....	32
Diarrhea.....	3
Dysentery.....	1
Enteritis.....	4
Other diseases.....	49
Total	126

In the August report Major Edwards makes the following statement:

This command remained in camp near Ponce, P. R., until August 7, when it moved toward San Juan on the military road and arrived at a point 1 mile beyond Coamo August 10. August 13 it moved one-half mile farther up the road and is now encamped at the latter place. There has been a large increase of sickness, especially in this camp. The diseases are principally fever (malarial), some typhoid cases, disturbances of the digestive tract, acute diarrhea being the principal trouble, a moderate proportion of the cases showing a decided tendency to become chronic; very few of the men have entirely escaped. It has been impossible to determine the precise cause; it has been attributed to a variety of causes and is probably due to the condition of the climate and lack of variety of food—these, in my opinion, being the chief causes. I have had some difficulty in getting necessary medical supplies during this month.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength	1,306
Typhoid fever.....	22
Malaria.....	132
Undetermined fever.....	30
Diarrhea.....	44
Enteritis.....	7
Dysentery.....	3
Gastritis.....	1
Other diseases.....	61
Total	300

The following is a list of the cases of protracted fever in this regiment:

A.—At Chickamauga, Ga.

- No. 1. Company G: Diarrhea, May 24 to June 9.
- No. 2. Company C: Diarrhea, May 28; still sick in division hospital June 30. There is no further record of this case.
- No. 3. Company C: Dysentery, May 28; sent to Fort Thomas July 6; returned to duty October 31. At Fort Thomas this case was recognized as a case of typhoid fever.
- No. 4. Company D: Diarrhea, May 29 to June 9.
- No. 5. Company I: Diarrhea, May 29; still sick June 30. There is no record of this man having been returned to duty at any time.
- No. 6. Company F: Dysentery, May 29; still sick June 30.
- No. 7. Company D: Diarrhea, May 30; still sick June 30.
- No. 8. Company D: Diarrhea, May 30; still sick June 30.
- No. 9. Company M: Dysentery, May 30; still sick June 30.
- No. 10. Company I: Diarrhea, May 31; still sick June 30.
- No. 11. Company D: Diarrhea, May 31; still sick June 30.
- No. 12. Company G: Diarrhea, June 2 to 13.
- No. 13. Company G: Diarrhea, June 2; still sick in division hospital June 30.
- No. 14. Company M: Remittent malaria, June 4; still sick in division hospital June 30.
- No. 15. Band: Dysentery, June 5 to 15.
- No. 16. Company K: Diarrhea, June 5; sent to division hospital June 9. Here the patient was kept under the diagnosis of diarrhea until July 6, when he was forwarded to Fort Thomas. At Fort Thomas the case was diagnosed typhoid fever, and the patient was returned to duty September 9.
- No. 17. Company M: Remittent malaria, June 6; still sick in division hospital June 30.
- No. 18. Company D: Undetermined fever, June 7; sent to division hospital June 11; transferred to Fort Thomas July 6. At Fort Thomas the disease was diagnosed typhoid fever, and the patient was reported for duty October 1.
- No. 19. Company E: Dysentery, June 7; still sick in division hospital June 30.
- No. 20. Company C: Typhoid fever, June 8; sent to division hospital June 11. There is no further record of this case.
- No. 21. Company D: Diarrhea, June 9; still sick in division hospital June 30.
- No. 22. Company I: Diarrhea, June 9; still sick in division hospital June 30.
- No. 23. Company D: Undetermined fever, June 11; sent to division hospital June 11; transferred to Fort Thomas July 6. Here the disease was diagnosed typhoid fever, and the patient was returned to duty October 1.
- No. 24. Company D: Typhoid fever, June 12; sent to Fort Thomas July 6; returned to duty October 16.
- No. 25. Company L: Undetermined fever, June 15; sent to division hospital July 5; here the disease was diagnosed typhoid fever, and the patient was furloughed August 20.
- No. 26. Company L: Remittent malaria, June 15 to 28.
- No. 27. Band: Typhoid fever, June 16; still sick in division hospital June 30.
- No. 28. Company L: Undetermined fever, June 16; sent to division hospital June 22. There is no further record of this case.
- No. 29. Company G: Typhoid fever, June 17; sent to division hospital July 1. There is no further record of this case.
- No. 30. Company F: Diarrhea, June 19 to July 4.
- No. 31. Company H: Typhoid fever, June 20; furloughed from Leiter Hospital July 21.
- No. 32. Company C: Typhoid fever, June 20; still sick in Leiter Hospital June 30.
- No. 33. Company E: Intermittent malaria, June 20; still sick in division hospital July 31.
- No. 34. Company C: Undetermined fever, June 20 to August 17. In Leiter Hospital this case was diagnosed typhoid fever.

No. 35. Company D: Undetermined fever, June 23; still sick in division hospital July 31.

No. 36. Company H: Enteritis, June 23; sent to Fort Thomas July 5; here the disease was diagnosed typhoid fever, and the patient was returned to duty July 19.

No. 37. Company not given: Intermittent malaria, June 24; still sick July 31.

No. 38. Company H: Typhoid fever, June 24; sent to division hospital June 20. There is no further record of this case.

No. 39. Company D: Remittent malaria, June 24; still sick in division hospital July 31.

No. 309. Company D: Malaria, September 4; sent to Philadelphia Hospital October 8. Here the diagnosis of remittent malaria was continued and the patient was still sick November 2.

No. 310. Company M: Malaria, September 5; sent to Philadelphia Hospital October 8. Here the diagnosis of remittent malaria was continued and the patient was furloughed October 24.

No. 311. Company C: Malaria, September 5; sent to Philadelphia Hospital October 8. Here the diagnosis was changed to typhoid fever and the patient was furloughed October 18.

No. 312. Company E: Malaria, September 5; sent to Fortress Monroe October 8. Here the diagnosis was changed to typhoid fever and the patient was furloughed October 22.

No. 313. Company H: Malaria, September 5; sent to Philadelphia Hospital October 5. Here the diagnosis of remittent malaria was continued and the patient was furloughed October 28.

No. 314. Company G: Malaria, September 5; sent to Fortress Monroe October 5. Here the diagnosis was changed to typhoid fever and the patient was discharged November 15.

No. 315. Company L: Malaria, September 5; sent to Fortress Monroe October 8. Here the diagnosis was changed to typhoid fever, and the patient was discharged November 2.

No. 316. Company M: Malaria, September 5; sent to Fortress Monroe October 5. Here the diagnosis was changed to typhoid fever, and the patient was discharged November 2.

No. 317. Company B: Malaria, September 5; sent to Jefferson Medical College Hospital October 5. Here the diagnosis was changed to typhoid fever, and the patient was discharged convalescent October 5.

No. 318. Company A: Malaria, September 8; the patient was sent to Philadelphia October 8. Here the diagnosis of remittent malaria was continued, and the patient was still sick November 12.

No. 319. Company E: Malaria, September 14; sent to Philadelphia October 8. Here the diagnosis of remittent malaria was continued, and the patient was furloughed October 18.

No. 320. Company not given: Malaria, September 15; sent to Fortress Monroe October 8. Here the diagnosis was changed to typhoid fever; the patient being convalescent was furloughed October 8.

No. 321. Company E: Malaria, September 16; sent to Philadelphia October 8. Here the diagnosis was changed to typhoid fever; patient was still sick November 2.

No. 322. Company K: Malaria September 16; sent to Philadelphia October 8. Here the diagnosis was changed to typhoid fever; patient was furloughed December 23.

No. 323. Company E: Malaria, September 16; sent to Fortress Monroe October 8. Here the diagnosis was changed to typhoid fever; patient was discharged November 2.

No. 324. Company K: Malaria, September 16; sent to Philadelphia October 8. Here the diagnosis of intermittent malaria was continued; patient was furloughed October 22.

No. 325. Company H: Malaria, September 20; sent to Philadelphia October 8. Here the diagnosis of remittent malaria was continued; patient was still sick November 8.

No. 326. Company E: Malaria, September 20; sent to Philadelphia October 5. Here the diagnosis of remittent malaria was continued; patient was furloughed October 31.

No. 327. Company L: Malaria, September 20; sent to Philadelphia October 5. Here the diagnosis of remittent malaria was continued; patient was furloughed October 16.

No. 328. Company G: Malaria, September 20; sent to Philadelphia October 5. Here the diagnosis was changed to typhoid fever; patient was still sick November 2.

No. 329. Company G: Malaria, September 20; sent to Fortress Monroe October 5. Here the diagnosis was changed to typhoid fever; patient was discharged November 2.

No. 330. Company H: Malaria, September 20; sent to Fortress Monroe October 5. Here the diagnosis was changed to typhoid fever, and the patient was discharged November 2.

No. 331. Company H: Malaria, September 25; sent to Philadelphia October 8. Here the diagnosis of remittent malaria was continued, and the patient was still sick November 26.

No. 332. Company C: Malaria, September 27; sent to Philadelphia October 8. Here the diagnosis was changed to typhoid fever, and the patient died October 16.

No. 333. Company M: Malaria, September 27; sent to Philadelphia October 8. Here the diagnosis of remittent malaria was continued, and the patient was still sick November 2.

No. 334. Company F: Malaria, September 27; sent to Philadelphia October 8. Here the diagnosis of remittent malaria was continued, and the patient was furloughed October 18.

No. 335. Company L: Malaria, September 27; sent to Philadelphia October 8. Here the diagnosis of remittent malaria was continued, and the patient was furloughed October 21.

No. 336. Company H: Malaria, September 28; sent to Philadelphia October 8. Here the diagnosis of remittent malaria was continued, and the patient was furloughed October 18.

No. 337. Staff: Malaria, September 29; sent to Philadelphia October 8. Here the diagnosis was changed to subacute enteritis, and the patient was still sick October 30.

No. 338. Company K: Malaria, September 29; Sent to Philadelphia October 8. Here the diagnosis of remittent malaria was continued, and the patient was furloughed October 18.

No. 339. Band: Malaria, September 29; sent to Philadelphia October 8. Here the diagnosis of remittent malaria was continued, and the patient was furloughed October 18.

No. 340. Company D: Malaria, September 30; sent to Fortress Monroe November 28. Here the diagnosis was changed to typhoid fever; further disposition of the patient is not given.

No. 341. Company D: Malaria, September 30; sent to Fortress Monroe November 28. Here the diagnosis was changed to typhoid fever, and the further disposition of the patient is not given.

No. 342. Company E: Malaria, October 1; sent to Fortress Monroe October 8. Here the diagnosis was changed to typhoid fever, and the patient was furloughed October 22.

No. 343. Company M: Malaria, October 2; sent to Philadelphia October 8. Here the diagnosis of remittent malaria was continued, and the patient was furloughed October 19.

No. 344. Company C: Malaria, October 2; sent to Philadelphia October 8. Here the diagnosis of remittent malaria was continued, and the patient was furloughed October 18.

No. 345. Company M: Malaria, October 2; sent to Philadelphia October 8. Here the diagnosis of remittent malaria was continued, and the patient was furloughed October 18.

No. 346. Company B: Malaria, October 5; sent to Philadelphia Hospital November 19. Here the diagnosis of remittent malaria was continued, and the patient was discharged November 30.

No. 347. Company C: Malaria, October 8; sent to Fortress Monroe without date. Here the diagnosis was changed to typhoid fever, and the patient died October 16.

No. 348. Company C: Malaria, October 8; sent to Fortress Monroe without date. Here the diagnosis was changed to typhoid fever, and the patient was furloughed October 18.

No. 349. Company K: Malaria, October 8; sent to Fortress Monroe without date. Here the diagnosis was changed to typhoid fever, and the patient was furloughed October 22.

No. 350. Company K: Malaria, October 8; sent to Fortress Monroe without date. Here the diagnosis was changed to typhoid fever, and the patient was furloughed November 23.

No. 351. Company I: Malaria, October 12; sent to Philadelphia without date. Here the diagnosis of remittent malaria was continued, and the patient was still sick November 26.

No. 352. Company A: Malaria, October 20; sent to Philadelphia November 28. Here the diagnosis was changed to typhoid fever. The ultimate disposition of this patient is not given.

No. 353. Company G: Malaria, October 20; sent to Philadelphia November 28. Here the diagnosis was changed to typhoid fever. The further disposition of this patient is not given.

No. 354. Company G: Malaria, October 20; sent to Fortress Monroe November 28. Here the diagnosis was changed to typhoid fever, and the further disposition of this patient is not given.

No. 355. Company A: Malaria, October 20; sent to Fortress Monroe October 20. Here the diagnosis was changed to typhoid fever, and the further disposition of the patient is not given. Of course the initial date of this case was earlier than October 20.

No. 356. Company H: Malaria, Oct. 24; sent to Philadelphia November 26. Here the diagnosis of remittent malaria was continued, and the patient was still sick in hospital December 26.

No. 357. Company D: Malaria, October 25; sent to Fortress Monroe November 28. Here the diagnosis was changed to typhoid fever, and the patient was discharged December 12.

No. 358. Company A: Malaria, October 26; sent to Philadelphia November 26. Here the diagnosis of intermittent malaria was continued, and the patient was still sick December 26.

No. 359. Company A: Malaria, without date; sent to Episcopal

Hospital, Philadelphia, October 26. Here the diagnosis was changed to typhoid fever, and the patient was discharged October 31.

No. 360. Company A: Malaria, without date; sent to Woman's Hospital, Philadelphia, October 26. Here the disease was diagnosed typhoid fever, and the patient was still sick October 31.

No. 361. Company A: Malaria, without date; sent to St. Joseph's Hospital, Philadelphia, October 26. Here the disease was diagnosed typhoid fever, and the patient was still sick October 31.

No. 362. Company A: Malaria, without date; sent to Medical Chirurgical Hospital, Philadelphia, October 26. Here the disease was diagnosed typhoid fever, and the patient was still sick October 31.

No. 363. Company C: Malaria, without date; sent to St. Joseph's Hospital, Philadelphia, October 26. Here the disease was diagnosed typhoid fever, and the patient was discharged October 29.

No. 364. Company C: Malaria, without date; sent to hospital in Philadelphia October 26. Here the disease was diagnosed typhoid fever, and the patient was still sick October 31.

No. 365. Company D: Malaria, without date; sent to hospital in Philadelphia October 26. Here the disease was diagnosed typhoid fever, and the patient was still sick October 31.

No. 366. Company E: Malaria, without date; sent to hospital in Philadelphia October 26. Here the disease was diagnosed typhoid fever, and the patient was discharged October 31.

No. 367. Company not given: Malaria, without date; sent to hospital in Philadelphia October 26. Here the disease was diagnosed typhoid fever, and the patient was still sick October 31.

No. 368. Company G: Malaria, without date; sent to hospital in Philadelphia October 26. Here the disease was diagnosed typhoid fever, and the patient was still sick October 31.

No. 369. Company H: Malaria, without date; sent to hospital in Philadelphia October 26. Here the disease was diagnosed typhoid fever, and the patient was still sick October 31.

No. 370. Company K: Malaria, without date; sent to St. Joseph's Hospital, Philadelphia, October 26. Here the disease was diagnosed typhoid fever, and the patient was discharged October 31.

No. 371. Company H: Malaria, without date; sent to Woman's Hospital, Philadelphia, October 26. Here the disease was diagnosed typhoid fever, and the patient was still sick October 31.

No. 372. Company K: Malaria, without date; sent to Jefferson Medical College, Philadelphia, October 26. Here the disease was diagnosed typhoid fever, and the further disposition of this patient is not given.

No. 373. Company H: Malaria, October 29; sent to Philadelphia Hospital November 26. Here the disease was diagnosed typhoid fever, and the patient was still sick December 5.

No. 374. Company C: Malaria, without date; sent to Philadelphia Hospital November 26. Here the diagnosis of remittent malaria complicated with diarrhea was continued, and the patient was still sick December 6.

No. 375. Company L: Malaria, October 29; sent to Fortress Monroe November 26. Here the disease was diagnosed typhoid fever, and the patient was discharged December 5.

No. 376. Company L: Malaria, October 29; sent to Philadelphia Hospital November 26. Here the diagnosis was changed to typhoid fever, and the patient was still sick December 5.

No. 377. Band: Malaria, November 6; sent to Philadelphia Hospital November 26. Here the disease was diagnosed intermittent malaria complicated with diarrhea, and the patient was still sick December 26.

No. 378. Company H: Malaria, without date; sent to Fortress Monroe November 26. Here the disease was diagnosed typhoid fever, and the patient was discharged December 5.

SUMMARY.

Assembled at camp near Milwaukee, Wis.	
Mustered into United States service May 8, 1898.	
Arrived at Chickamauga Park, Ga., May 15, 1898.	
Strength on arrival, 1,024.	
Date of first case of probable typhoid fever May 24, 1898.	
Date of first case of recognized typhoid fever May 28, 1898.	
Left Chickamauga Park July 5, 1898.	
Strength on departure, 1,313.	
Number of cases of probable typhoid fever developed at Chickamauga	49
Arrived at Charleston, S. C., July 6, 1898.	
Left Charleston, S. C., July 20, 1898.	
Number of cases of probable typhoid fever developed at Charleston	41
Landed at Ponce, P. R., July 27 and 28, 1898.	
Number of cases of probable typhoid fever developed during the voyage from Charleston to Porto Rico	13
Number of cases of protracted fever developed in Porto Rico:	
From July 28-31, 1898	6
During August	197
During September	33
During October	37
From November 1-6	2
<hr/>	
Total number of cases of protracted fever reported in this regiment	378
These 378 cases were diagnosed as follows:	
Typhoid fever	107
Undetermined fever	56
Malaria	152
Diarrhea	50
Dysentery	6
Enteritis	1
Gastritis	6
<hr/>	
Total	378

It is interesting to note that up to the time when this regiment reached Charleston the regimental surgeon had diagnosed only 9 cases of typhoid fever. Our list shows that up to the same time there had been 49 cases of prolonged fever. Supposing that the regimental surgeon's diagnoses were correct, a little more than 18 per cent of the protracted fevers were typhoid fever. From the time of leaving Chickamauga to that of landing at Ponce there were 54 cases of protracted fever, 12 of which were recognized by the regimental surgeon as typhoid fever. From this it would appear that at this time 22 per cent of the protracted fevers were typhoid. In Porto Rico there were 275 cases of protracted fever and 21 of these were diagnosed by the regimental surgeon as typhoid. This would indicate that a little more than 8 per cent of the protracted fevers developed in Porto Rico were typhoid. Certainly a considerable number of the protracted fevers contracted in Porto Rico were malarial. Have we any data from which we may determine the proportion between the typhoid fevers and the malarial fevers among the cases developed in Porto Rico? In answer to this inquiry we may state that 79 cases developed in Porto Rico and diagnosed as malaria by the regimental surgeons were sent to the general hospital at Fortress Monroe and to the civil hospitals in Philadelphia. In

51 of these the diagnosis was changed at these hospitals to typhoid fever, in 27 cases the diagnosis of malaria was continued, and in 1 case it was changed to enteritis. This would indicate that about 64 per cent of the cases developed in Porto Rico and reported as malarial by the regimental surgeons were actually typhoid fever. However, we must not be too ready to draw conclusions from the data given. In the first place we can not assume that the cases sent back to the United States were representative of all the cases that occurred in this regiment in Porto Rico. Some patients were not sent home because they were supposed to be too ill to bear the voyage and others were not sent home because it was believed that they would soon recover where they were. Lastly, we are not absolutely certain of the correctness of the diagnoses made in the hospitals at Fortress Monroe and Philadelphia. It seems that change in diagnosis from malaria to typhoid fever depended somewhat upon the hospital to which the patient was sent. It is a fact which one may verify by inspection of the list of protracted fevers that we have given for this regiment, that in every case of so-called malaria sent from this regiment to Fortress Monroe the diagnosis was changed to typhoid fever, and the malarial plasmodium was found only in cases sent to the Philadelphia hospitals; and should we pursue the investigation further we would find that some of the Philadelphia observers were much more successful in the search for the plasmodium than others were.

In endeavoring to form some estimate of the actual number of cases of typhoid fever developed in this regiment while in Porto Rico, we may state that if the "undetermined fevers" be added to those recognized as typhoid in either regimental or hospital reports we have 97 cases of typhoid fever developed in Porto Rico. It is perfectly safe to assume that a considerable proportion of the other cases were also typhoid fever, but we have no means of determining this proportion with certainty.

We must not fail to observe that the last regimental report from this command was for the month of August and that all the information that we have concerning the sickness of later months is confined to cases sent to the United States on hospital ships. Of course, there were many cases treated in the hospitals of Porto Rico. The number treated there, however, we have not been able to ascertain.

This regiment was in all probability quite widely infected with typhoid fever before it reached Chickamauga. This is evidenced by the fact that 11 cases of probable typhoid fever developed in this regiment within sixteen days after its arrival at Chickamauga. In the light of our present knowledge there can be but little doubt that all of these were cases of typhoid fever, although only one is so diagnosed and that one was incorrectly diagnosed until the patient was sent to Fort Thomas.

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Bailey, Burt B.....	Corpl., M.	1898, Sept. 12	Ponce, P. R.....	Acute dysentery and typhoid.
Brace, Dwight C.....	Pvt., E.	Sept. 17do.....	Typhoid.
Bartlett, Sumner P....	Corpl., E.	Sept. 9	Coamo, P. R.....	Do.
Casberg, Maurice.....	Pvt., B.	Aug. 5	Fort Monroe, Va.....	Pneumonia.
Chapman, Earl A.....	Pvt., M.	Oct. 8	Sparta, Wis.....	Consumption.
Curtins, Paul.....	Pvt., K.	Aug. 9	Charleston, S. C.....	Typhoid.
Cumming, Charles V....	Corpl., H.	Nov. 9	Ponce, P. R.....	Do.
De Lapp, John W.....	Pvt., D.	Nov. 9	Syracuse, N. Y.....	Do.
Eaton, Frank N.....	Pvt., M.	Nov. 23	La Crosse, Wis.....	Acute dysentery.
Eck, Charles.....	Pvt., E.	May 22	Camp Thomas, Ga.....	Convulsions.
Edwards, George H....	Qm. sgt. H.	Aug. 31	Coamo, P. R.....	Typhoid.
Gates, Daniel W.....	Sgt., A.	July 13	Chickamauga, Ga.....	Do.
Gamble, James H.....	Pvt., F.	Sept. 20	Ponce, P. R.....	Do.
Ganger, Frank.....	Pvt., G.	Oct. 21do.....	Do.
Gedhouse, Fred R.....	Corpl., D.	Oct. 24	Hospital ship <i>Relief</i> ..	Do.
Hetherington, E. W....	Pvt., A.	Oct. 16	Division hospital.....	Do.
Keiley, Thomas L.....	Pvt., I.	Dec. 11	West Superior, Wis....	Do.
Loomis, Frank B.....	Corpl., F.	Sept. 8	Coamo, P. R.....	Do.
Moyer, Miner E.....	Pvt., L.	Nov. 1	Philadelphia, Pa.....	Do.
McArthur, Charles L...	Pvt., L.	Sept. 11	Coamo, P. R.....	Do.
Noyes, Ellis.....	Pvt., A.	Aug. 23	Ponce, P. R.....	Cerebral embolism.
Nolan, Peter R.....	Pvt., L.	Oct. 27	San Juan, P. R.....	Typhoid.
Olson, Halvor.....	Corpl., C.	Oct. 15	Fort Monroe, Va.....	Dysentery.
Roberts, Frank W.....	Pvt., H.	July 31	Charleston, S. C.....	Typhoid.
Smith, Christie H.....	Corpl., K.	1899, Feb. 1	Do.
Swift, Hector R.....	2d Lt., I.	1898, July 22	Charleston, S. C.....	Do.
Stanley, Frank E.....	Corpl., A.	Sept. 6	Ponce, P. R.....	Do.
Sunderlin, Charles....	Pvt., H.	Oct. 2	Coamo, P. R.....	Tumor of brain.
Swanson, Oscar R....	Pvt., L.	Aug. 12	Asomanta, P. R.....	Killed in action.
Thoreson, Alfred G....	Pvt., M.	Oct. 4	Hospital ship <i>Relief</i> ..	Epileptic Convulsions.
Tuecheck, Joseph.....	Pvt., B.	Oct. 18	Ponce, P. R.....	Typhoid.
Turner, James.....	Pvt., H.	Sept. 8	Coamo, P. R.....	Malarial fever.
Vought, Fred J.....	Pvt., L.	Aug. 12	Aibonito, P. R.....	Wounds.
Wagner, Charles.....	Pvt., H.	Oct. 6	Coamo, P. R.....	Typhoid.
Wachter, Edward.....	Pvt., H.	Sept. 18do.....	Do.
Zimmerman, Oscar L...	Pvt., K.	Oct. 15do.....	Do.
Total deaths.....				36
Deaths due to typhoid fever.....				25

Percentage of deaths among total cases of protracted fever (378), 6.61.

Percentage of deaths among recognized cases of typhoid fever (107), 23.36.

FIFTH ILLINOIS VOLUNTEER INFANTRY.

First Brigade, First Division, First Army Corps.

In the May report Lieut. E. W. Ames, in charge, makes the following statement:

The regiment was mustered into service at Camp Tanner, Springfield, Ill., May 7, 1898, and departed for Camp George H. Thomas, Chickamauga Park, Ga., on May 14, arriving at the latter place May 17. Climatic conditions at Camp Tanner were such as to cause much sickness after departure. The hospital was open May 14. Private Roscoe C. Gibbons, of Company L, was found in his quarters on the morning of May 15 in an unconscious condition. He had secured food from a huckster wagon. He died in the regimental hospital the following morning; diagnosis: Ptomain poisoning.

CONDENSED SICK REPORT FROM MAY 14 TO 31, INCLUSIVE.

Mean strength	1,066
Intermittent malaria.....	1
Acute diarrhea.....	5
Ptomain poisoning.....	6
Typhoid fever.....	1
Other diseases.....	36
Total	49

The case of recognized typhoid fever was that of a private in Company L. The initial date of his sickness is given as May 16. The disposition of this case is not stated.

It may be of interest to observe that the case of recognized typhoid fever and that of fatal ptomain poisoning occurred in the same company. As the regiment left Springfield May 14 and reached Chickamauga May 17, it will be seen that the recognized case of typhoid fever developed on the journey, and the disease must have been contracted before leaving Illinois, and the probabilities are that it was contracted before May 7, the time when the regiment was mustered into service.

It will thus be seen that this regiment carried typhoid fever with it to Chickamauga Park. The case of intermittent malaria was off duty for only three days. Another case which might possibly have been typhoid fever is that of a private in Company B. This man was taken ill May 31, and with a diagnosis of undetermined fever was sent to the field hospital of the first division of the First Army Corps.

In the June report Lieutenant Ames makes the following statement:

Mumps and measles were prevalent during the month. The epidemics subsided near the close of the month. Isolation was rigidly enforced. About twenty cases of typhoid fever developed, the diagnosis being confirmed after transfer to the first division hospital. Strict sanitary conditions were secured, and a futile attempt to control huckster traffic, which has infested the camp from the beginning, was made. The epidemic is now subsiding. Lieut. Ezra C. Chacey, of Company E, was granted sick leave and sent to St. Vincent's Hospital, Chattanooga, June 24.

CONDENSED SICK REPORT FOR JUNE.

Mean strength	1,298
Intermittent malaria.....	2
Malaria.....	2
Acute diarrhea.....	4
Enteritis.....	3
Dyspepsia.....	5
Typhoid fever.....	2
Other diseases.....	69
Total	87

It is interesting to note that while the surgeon in his comments states that 20 cases of typhoid fever developed during the month of June, his report contains only 2 recognized cases. This confirms the fact frequently observed in other regiments that while typhoid fever was known to prevail, the cases were not always recorded with proper diagnosis.

Dyspepsia seems to have been a severe disease in this regiment, and several cases were sent to the hospital for treatment. Some of these, as we shall see later, proved to be typhoid fever. It is quite evident that this regiment brought typhoid fever with it from Springfield, and that early in June it became quite widely infected.

The report for July is signed by Major Kelly, without comment.

CONDENSED SICK REPORT FOR JULY.

Mean strength	1,296
Intermittent malaria	6
Acute diarrhea	1
Enteritis	6
Undetermined fever	4
Typhoid fever	13
Other diseases	35
Total	65

The August report is without comment.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength	1,187
Remittent malaria	15
Enteritis	31
Undetermined fever	42
Typhoid fever	42
Other diseases	13
Total	143

This regiment left Chickamauga Park August 3 and went to Newport News, Va. Later it was transferred to Camp Hamilton near Lexington, Ky. Up to August 17 all of the cases were sent to the general hospital at Fort Monroe, Va. After August 20 cases were sent to the field hospital of the Third Division of the First Army Corps, or to other hospitals at Lexington, Ky.

The September report is without comment.

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength	1,262
Remittent malaria	13
Undetermined fever	3
Typhoid fever	27
Other diseases	2
Total	45

Most of the cases of typhoid recognized in this report are brought over from previous months.

Sometime in September, the exact date not known to us, this regiment was transferred to Camp Lincoln, Springfield, Ill. Here it was mustered out of service October 16.

CONDENSED SICK REPORT FROM OCTOBER 1-16, INCLUSIVE.

Mean strength	1,194
Typhoid fever	6
Other diseases	3
Total	9

Of course this report covers only a small detachment.

The following is a list of the recognized and probable cases of typhoid fever in this regiment:

A.—At Chickamauga, Ga.

No. 1. Company L: Typhoid fever, May 16; disposition not given.

No. 2. Company E: Bronchitis, June 8; sent to division hospital June 9. Here the diagnosis was changed to typhoid fever; the further disposition of this patient is not given.

No. 3. Company L: Dyspepsia, June 11; sent to division hospital June 15. Here the diagnosis was changed to typhoid fever, and the further disposition of this patient is not given.

No. 4. Company K: Undetermined fever, June 17; sent to division hospital June 19. Here the diagnosis was changed to typhoid fever, and the patient was returned to duty July 16.

No. 5. Company I: Sent to division hospital without diagnosis June 17. Here the disease was diagnosed typhoid fever. Further disposition of this patient is not given.

No. 6. Company G: Sent to division hospital without diagnosis June 21. Here the disease was diagnosed typhoid fever, and the patient was furloughed August 9.

No. 7. Company H: Sent to division hospital without diagnosis June 26. Here the disease was diagnosed typhoid fever, and the patient is recorded as having been returned to duty July 15. However, it is more than probable that the patient was furloughed at this time.

No. 8. Company G: Sent to division hospital without diagnosis June 27. Here the disease was diagnosed typhoid fever, and the patient was furloughed July 11.

No. 9. Company I: Malaria, June 28; sent to division hospital June 29. Here the diagnosis was changed to typhoid fever, and the patient was furloughed July 11.

No. 10. Company B: Sent to division hospital without diagnosis June 29. Here the disease was diagnosed typhoid fever, and the patient was furloughed August 30.

No. 11. Company F: Sent to division hospital without diagnosis June 29. Here the disease was diagnosed malaria, and the patient was still sick in hospital July 31.

No. 12. Company A: Typhoid fever, July 1; furloughed July 19.

No. 13. Company M: Typhoid fever, July 2; sent to division hospital July 6. Further disposition not given.

No. 14. Company L: Typhoid fever, July 2; sent to division hospital July 4. Further disposition not given.

No. 15. Company K: Typhoid fever, July 4; sent to division hospital July 4. Further disposition not given.

No. 16. Company G: Sent to Leiter Hospital without diagnosis July 5. Here the disease was diagnosed typhoid fever, and the patient was furloughed August 27.

No. 17. Company M: Typhoid fever, July 7; furloughed July 16.

No. 18. Company F: Typhoid fever, July 11; sent to division hospital July 12. Further disposition not given.

No. 19. Company A: Typhoid fever, July 12; furloughed from division hospital August 8.

No. 20. Company C: Typhoid fever, July 13; sent to St. Vincent's Hospital, Chattanooga, Tenn.

No. 21. Company M: Malaria, July 13; furloughed from division hospital July 22.

No. 22. Company H: Malaria, July 13; still sick in division hospital July 31.

No. 23. Company K: Remittent malaria, July 14; furloughed July 24.

No. 24. Company I: Typhoid fever, July 14; sent to division hospital July 14. Further disposition not given.

No. 25. Company L: Sent to Leiter Hospital without diagnosis July 15. Here the disease was diagnosed typhoid fever, and the patient was returned to quarters August 18.

No. 26. Company K: Sent to division hospital without diagnosis July 15. Here the disease was diagnosed as malaria, and the patient was furloughed September 17.

No. 27. Company K: Typhoid fever, July 15; furloughed July 26. As an evidence of the imperfect way in which the records of this regiment have been kept, it may be interesting to state that the record shows that this man was returned to duty July 26, when in fact he was on furlough and reported still sick at Springfield in September.

No. 28. Company M: Typhoid fever, July 16; sent to division hospital July 17. Further disposition not given.

No. 29. Company E: Malaria, July 17; furloughed July 28.
 No. 30. Company B: Malaria, July 18; furloughed July 28.
 No. 31. Company D: Sent to division hospital without diagnosis July 19. Here the disease was diagnosed malaria, and the patient was still sick July 31.

No. 32. Company I: Malaria, July 19; sent to division hospital July 19. Here the disease was recognized as typhoid fever, and the patient was transferred July 24. The hospital to which this transfer was made is not mentioned.

No. 33. Band: Sent to Leiter Hospital July 19 without diagnosis. Here the disease was diagnosed intermittent malaria, and the patient was furloughed August 1.

No. 34. Company L: Remittent malaria, July 21; sent to division hospital July 23. Here the diagnosis was changed to typhoid fever. The disposition of this patient is not given.

No. 35. Company A: Remittent malaria, July 21; sent to division hospital July 24. Here the diagnosis was changed to typhoid fever, but there is no further record of this case.

No. 36. Company B: Typhoid fever, July 21; sent to St. Vincent's Hospital without date.

No. 37. Company C: Enteritis, July 22; sent to division hospital July 22. Here the diagnosis was changed to typhoid fever, and the further disposition of this patient is not given.

No. 38. Company G: Typhoid fever, July 24; sent to division hospital July 26; transferred to Sternberg Hospital September 6; furloughed October 8.

No. 39. Company L: Typhoid fever, July 29; furloughed from division hospital August 10.

No. 40. Staff: Typhoid fever, July 29; sent to St. Vincent's Hospital without date.

No. 41. Staff: Typhoid fever, July 29; sent to St. Vincent's Hospital without date.

No. 42. Company K: Malaria, July 29; still sick in quarters August 21.

No. 43. Company E: Intermittent malaria, July 30; sent to division hospital July 31. Here the diagnosis was changed to typhoid fever, but there is no further record.

No. 44. Company H: Sent to division hospital without diagnosis July 31. Here the disease was diagnosed typhoid fever, and the patient was furloughed August 7.

No. 45. Company H: Sent to division hospital without diagnosis August 3. Here the disease was diagnosed typhoid fever, and the patient was furloughed August 18.

No. 46. Company E: Sent to division hospital without diagnosis August 3. Here the disease was diagnosed typhoid fever, and the patient was furloughed August 13.

No. 47. Company H: Sent to division hospital without diagnosis August 3. Here the disease was diagnosed typhoid fever, and the patient was returned to quarters August 18.

No. 108. Company C: Typhoid fever, August 27; sent to infirmary.

No. 109. Company A: Typhoid fever, August 27; sent to Fortress Monroe.

No. 110. Company C: Typhoid fever, August 27; sent to St. Joseph's Hospital.

No. 111. Company L: Typhoid fever, August 27; sent to Field Hospital at Lexington.

No. 112. Company I: Typhoid fever, August 28; sent to division hospital September 3.

No. 113. Company K: Typhoid fever, August 29; sent to division hospital September 3.

No. 114. Company G: Typhoid fever, September 1; sent to division hospital September 3.

No. 115. Company I: Typhoid fever, September 1; sent to division hospital September 2.

No. 116. Company D: Typhoid fever, September 1; sent to division hospital September 3.

No. 117. Company B: Remittent malaria, September 2; still sick in quarters September 26.

No. 118. Company B: Typhoid fever, September 2; sent to military hospital September 2.

No. 119. Company H: Typhoid fever, September 2; sent to military hospital without date.

No. 120. Company not given: Typhoid fever, September 4; sent to Fortress Monroe October 5; discharged December 31.

No. 121. Company not given: Typhoid fever, September 14; sent to military hospital without date.

No. 122. Company not given: Typhoid fever, September 16; sent to military hospital.

No. 123. Company not given: Typhoid fever, September 16; sent to military hospital.

No. 124. Company C: Typhoid fever, September 16; sent to military hospital.

No. 125. Company M: Typhoid fever without date; sent to the infirmary without date.

It will be noticed that after the regiment left Newport News several patients were sent to Fortress Monroe. We have been unable to ascertain whether these were sent from Lexington or came from a detachment left at Newport News.

SUMMARY.

Assembled at Camp Tanner, Springfield, Ill., April 26, 1898.

Mustered into United States service May 7, 1898.

Arrived at Chickamauga Park, Ga., May 17, 1898.

Strength on arrival, 1,066.

Date of first case of probable typhoid fever, May 16, 1898.

Date of first case of recognized typhoid fever, May 16, 1898.

Left Chickamauga Park August 3, 1898.

Strength on departure, 1,296.

Number of cases of probable typhoid fever developed at Chickamauga..... 47

Arrived at Newport News, Va., August 5, 1898.

Left Newport News August 17, 1898.

Number of cases of probable typhoid fever developed at Newport News..... 29

Arrived at Lexington, Ky., August 20, 1898.

Number of cases of probable typhoid fever developed at Lexington from August 20-31, 1898..... 37

Number of cases of probable typhoid fever developed at Lexington, Ky., and at Springfield, Ill., from September 1-16, 1898..... 12

Total number of cases of probable typhoid fever reported from this regiment..... 125

These 125 cases were diagnosed as follows:

Typhoid fever..... 113

Malaria..... 12

Total..... 125

The following is a list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Bohnert, Ludwig R....	Pvt., C...	1898. May 28	Camp Thomas, Ga....	Acute ptomain poisoning.
Bosley, Frank C.....	Pvt., G....	May 29do.....	Pneumonia.

Percentage of deaths among recognized cases of typhoid fever (113), 7.08.

COMMUNICATIONS FROM THE SURGEONS OF THE FIFTH ILLINOIS VOLUNTEER INFANTRY.

Medical officers.

Milton R. Keely, surgeon, Dwight, Ill.
James L. Bevans, assistant surgeon, Decatur, Ill.
Elwin W. Ames, assistant surgeon, Canton, Ill.

Captain and Assistant-Surgeon Bevans states:

My regiment was stationed at Camp Tanner, Springfield, Ill., from April 26 to May 14, 1898. The water supply was from the city mains. An analysis proved it to be good. Water from the wells was condemned and its use forbidden.

The troops were stationed in buildings used for State fair purposes. My own regiment, the Fifth Illinois, occupied cattle sheds and stables. Indoor water-closets were used in part. The indiscriminate use of sheep pens and neighboring hillsides as privies finally necessitated the digging of sinks. These sinks were always filthy in the extreme. There is no doubt but that pneumonia and typhoid were taken by us to Chickamauga from Camp Tanner. The pneumonia was of unusually severe type.

On arrival at Chickamauga, May 15, 1898, we were encamped in a place which had been previously occupied by troops. There were old sinks, partly filled, scattered over the site of our camp. Tents were pitched over places where sinks had been. This state of affairs was remedied as far as possible. Owing to the character of the soil it was hard to make properly constructed sinks, and the clay was not a good substance with which to cover the fecal matter. There was often lack of cooperation on the part of commanding officers of regiments. It was difficult to obtain the services of guards for the sinks. There was no regular, systematic inspection from higher sources than the regiment. Occasionally a division or corps medical officer would visit our camp and make suggestions. Policing of the sinks and inspection of the camp, as far as my own regiment was concerned, was carried out thoroughly, but this was not so with many regiments, and all suffered alike from the faults of the few.

About the middle of June I was detailed for duty at the first division hospital of the First Army Corps. Here the sinks were always neglected. It was due to the fact that an insufficient number of men for the care of the sick were on hand. Much time of officers and men was wasted in carrying out conflicting and confusing orders from the corps surgeon. Letters on file with the records of the hospital will prove that the commanding officers who had charge at various times during the history of the hospital did all they could to call attention of the higher officers to the condition of affairs. Finally, Colonel Hartsuff took personal control of the hospital and brought about a lasting reform. An attempt was made at the disinfection of bedpans in use with typhoid patients, but the sinks were allowed to become almost level full without any attempt at policing. They were then imperfectly covered and new ones dug.

At Newport News, where my regiment went on July 28, the regiment as an organization was supreme. The camp was very small and the medical officers were able to carry out their own views in regard to the care of sinks, inspections, kitchens, and grounds. We suffered much from typhoid fever as a result of our stay in Chickamauga, but the camp was always in good condition.

From Newport News I went to Camp Meade, Pa., as acting surgeon of a battalion of the Sixteenth Pennsylvania, and stayed there from August 17 to September 1. After the lax regulations and inspections to which I had been accustomed in the other camps, the supervision as to sanitary matters at Camp Meade seemed almost tyrannical. There was constant, thorough, systematic inspection from sources higher than the regiment. A sufficient number of guards was provided to watch every sink, and each soldier was compelled to cover his own fecal matter, spades being provided for the purpose. Specific orders were issued as to the use of water, and filters were provided for use. Cooperation of commanding officers in sanitary matters was insisted upon. The slightest neglect in carrying out sanitary regulations in force at the camp was

followed by immediate reprimand of the officer at fault. The condition of the camp was excellent.

At Lexington no observations as to the sanitary conditions were made on account of my very short stay.

FOURTH OHIO VOLUNTEER INFANTRY.

Second Brigade, First Division, First Army Corps.

The May report is signed by Maj. E. M. Semans, who makes the following remarks:

All companies were mustered into service at Camp Bushnell, Columbus, Ohio, May 9, 1898. The regimental hospital was opened May 9. The command left for Camp George H. Thomas May 15, arriving May 16.

CONDENSED SICK REPORT FROM MAY 9-31, INCLUSIVE.

Mean strength.....	887
Admissions from command.....	37
Completed cases.....	27
Returned to duty.....	24
Transferred to other hospitals.....	3
Total.....	27
Remaining on sick report:	
Hospital.....	3
Quarters.....	7
Total.....	10

The June report is signed by Captain Wright, acting surgeon, who makes the following remarks:

The command has been in camp at Chickamauga Park, Camp George H. Thomas, Georgia, during the entire month. The health of the command has been excellent.

CONDENSED SICK REPORT FOR JUNE.

Mean strength.....	967
Admissions:	
Remaining from last month.....	10
From command.....	26
Total.....	36
Returned to duty.....	22
Transferred to other hospitals.....	8
Total.....	30
Remaining on sick report:	
Hospital.....	0
Quarters.....	8

This regiment left Chickamauga Park, Ga., July 22, and proceeded to Porto Rico. Unfortunately there is no sick report for July.

The August report is signed by Maj. E. M. Semans, with the following remarks:

On August 3, 98 patients landed from the transport *St. Paul*, and were placed in temporary hospital in Arroyo, P. R., by order of Maj. William Stephenson, chief surgeon of the Second Brigade.

On August 5, the regiment moved from Arroyo to Guayama, where a skirmish occurred in which four men were wounded. By order of Major Stephenson a hospital was established in the Spanish barracks at Guayama. On August 8, the regiment was engaged in a skirmish in the mountains, 4 miles north of Guayama. In this skirmish five men were wounded. On August 12, a division hospital was established near Guayama, and the patients from Arroyo and those from Guayama were transferred to this hospital. The prevailing diseases have been remittent malarial fever and acute diarrhea. These have been caused by the climate and by the eating of native fruits.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength	1,215
Admissions from command	143
Completed cases	132
Returned to duty	35
Died	2
Transferred to other hospitals	95
Total	132

There is no report for September, and we have no further record of this regiment. As has been stated this regiment reached Chickamauga Park May 16. On May 17, two cases diagnosed as remittent malaria, both of Company L, reported sick, and these men remained off duty, one for nine and the other for eleven days. On May 20 another case of malaria, also from Company L, reported at "sick call" and remained off duty eleven days. All of these may have been mild cases of typhoid fever. Another suspicious case occurred May 20. This man was a private from Company E. His case also was diagnosed as malaria and he was not returned to duty until twenty days after he reported himself sick. The fourth suspicious case was from Company C. This man reported sick May 22. His case was diagnosed malaria, and he remained sick in quarters until June 12. The fifth case was a private from Company M, who was taken sick May 23, and under the diagnosis of malaria was sent to division hospital May 28, and with the same diagnosis remained sick in hospital throughout the month of June. There can be but little doubt that this was a case of typhoid fever. From this time on cases, for the most part diagnosed as remittent malaria but undoubtedly actually typhoid fever, continued to be reported. The report for June is very incomplete and that for July is, as has been stated, wholly wanting.

The only two points which we have been able to ascertain concerning typhoid fever in this regiment up to the time of its leaving Chickamauga Park, which was July 22, are these:

(1) The regiment reached Chickamauga infected with typhoid fever.

(2) It left Chickamauga badly infected with this disease. Two deaths were reported from this regiment during its stay at Chickamauga, and there were 19 cases of probable typhoid.

During the month of August 111 cases of protracted fever are recorded in the regimental reports. Only 2 of these are recorded as cases of typhoid fever; the others are registered as cases of malaria. It would be interesting if we could know positively how nearly correct the diagnoses in this report are. If they be correct, this regiment practically lost all its typhoid fever between Chickamauga Park and Porto Rico. However, that the regimental diagnosis was not correct is evidenced by the fact that of nine men sent from this regiment while in Porto Rico to Fortress Monroe every one proved to be typhoid fever. How many of the other

cases of malaria reported in August were really cases of typhoid fever we have no means of determining. Neither have we any means of forming an estimate of the probable number of cases of typhoid fever in this command, further than to state that from the imperfect regimental reports and the records of different hospitals we have collected 146 cases. From the fact that all other regiments with more perfect records have furnished a much larger number, we are confident that we have not been able to find half the cases. We infer, from the fact that when this command reached Porto Rico it was necessary to send 98 patients to the hospital immediately, that protracted fevers became very numerous.

SUMMARY.

Assembled at Camp Bushnell, Columbus, Ohio, in April, 1898.
 Mustered into United States service, May 9, 1898.
 Arrived at Chickamauga Park, May 16, 1898.
 Strength on arrival, 887
 Date of first case of probable typhoid fever, May 17, 1898.
 Date of first case of recognized typhoid fever, July 16, 1898.
 Left Chickamauga Park, July 22, 1898.
 Strength on departure, 1,313.
 Number of cases of probable typhoid fever developed at Chickamauga 19

As has been stated, this regiment went to Porto Rico from Chickamauga Park. We have not been able to make any estimate further than that already given of the number of cases developed in this regiment after it left Chickamauga.

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Ahern, Patsy	Pvt., K.	1898. July 21	Camp Thomas, Ga.	Typhoid.
Briggs, Forrest C.	Pvt., H.	Nov. 10	Fort Hamilton, N. Y.	Typhoid and immediate exhaustion.
Couts, James H.	Pvt., G.	Sept. 23	Ponce, P. R.	Pulmonary tuberculosis.
Dodge, Daniel H.	Pvt., H.	Aug. 10	Arroya, P. R.	Typhoid and spinal meningitis.

Walker, John W.	Pvt., A.	Oct. 9	Guayama, P. R.	Typhoid.
Winter, Wesley Clark.	Pvt., G.	Sept. 5do.....	Do.

Total deaths. 26
 Deaths due to typhoid fever 19

It is impossible to figure out the percentage of deaths among the typhoid cases in this regiment, because we can form no estimate of the number of cases.

COMMUNICATIONS FROM THE SURGEONS OF THE FOURTH OHIO VOLUNTEER INFANTRY.

Medical officers.

Edward M. Seamans, major and surgeon, Delaware, Ohio.
T. B. Wright, captain and assistant surgeon, Circleville, Ohio.
Henry M. Taylor, captain and assistant surgeon, Columbus, Ohio.

Captain Wright makes the following statement:

As we moved from Camp Bushnell May 15, and had no typhoid fever before the middle of June, that camp can be eliminated from the report. We had only two or three cases of typhoid fever while in camp at Chickamauga Park, and in none of these could the source of contagion be definitely traced. We had a batch of cases develop about the same time during transit, between July 26 and August 3, then another apparently distinct lot of cases soon after landing in Porto Rico. After August 15 we had cases coming on all of the time till I left the regiment with the detachment to Vieques, in such a way as to show a steadily operating source of infection. After going to Vieques, I had two or three cases, all of which apparently were infected before leaving Porto Rico. Sanitary conditions at Camp Thomas were always first class in the camp of the Fourth Ohio. Every instruction of the War Department was carried out to the letter. The camp was well drained and was always kept clean; refuse was burned or buried; sinks were kept covered with earth and never allowed to become too full—twice, heavy rains caused them to fill with water, but they were always immediately counterdrained and filled. The men at that time and always were compelled to keep clean, and quarters were uniformly in good order. Blankets were always aired and the cooking of the companies received very careful attention. Inspections were regularly conducted by medical officers at least twice a day, and I feel that every point was carefully guarded from a sanitary standpoint. Upon my return to the regiment July 1 from First Division hospital, I directed that all water used in camp be boiled. This provision was carried out and drinking water was also filtered. I am sure that no point looking to the well-being and health of the men was overlooked, and call attention to the reports of Major Stevenson, brigade surgeon, as to the continuously good condition of this camp of the Fourth Ohio.

I think that the first group of typhoid cases was infected during the practice march July 15, when we were encamped for a few hours on the slope of Snodgrass Hill. Many of the men, in spite of orders to the contrary, filled canteens from a well across the ridge from which it is said a company of the First Ohio Cavalry had derived their water supply, and I have heard that this company had many typhoid cases develop soon after arriving at Tampa. I have, however, not been able to verify this statement. I think, moreover, that the second lot of cases in our regiment developed from infection taken in during the march to the train July 20, when men fell out by the score and drank water from numerous wells along the route, and especially from Cloud Spring, which was a suspected point to us at First Division hospital as early as June 20. The water supply of the Fourth Ohio at Camp Thomas was, up to July 1, almost entirely from the artesian wells, and I never thought this source of water supply was infected. After that time much of the supply came from Chickamauga Creek. This was full of coloring matter and probably of organic matter as well. It was, however, always boiled, so did not prove a source of infection to us. As early as June 15, while at the division hospital, I called attention to the fact that certain regiments were sending comparatively large numbers of typhoid patients and that certain water was probably infected. This report led to an investigation by the brigade surgeons of the First Division, First Army Corps, the result of which was never learned. I am

sure, in spite of the reports of the Government investigation to the contrary, that some sources of water supply at Camp Thomas were infected and that a more prompt investigation at the hands of the War Department would have been the means of at least more quickly limiting the epidemic. Yet, do not understand that I mean this as a reflection upon anyone. I am sure that the difficulties of this campaign were very well met and the handling of the army as a whole, from a health standpoint, was good. I wish to add that all suspected stools were promptly disinfected by us.

After landing with the advanced party at Arroyo I was not with the main camp of the regiment till August 14, but was at the hospital in Guayama. After camp was established at Guayama conditions were not good for two weeks. The camp was not well selected, but was apparently the best available from a military standpoint. The vegetation was very rank, the ground soft, and drainage poor, so that for two weeks things might have been better. By incessant labor, however, the ground was tramped hard, the grass removed, drainage improved, and the camp brought into good condition. Our care was never relaxed and the men worked with intelligence and vigor, so that things were brought into good condition at the earliest practicable moment. The water supply here was from the mountains and was apparently good and presumably free from infection. While I do not think any infection came from direct contact or from flies alighting on the food at Camp Thomas, such a thing might have been possible during this period at the camp at Guayama. It is certain that we carried the infection with us into Porto Rico, but I am not sure that there was not typhoid on the island before we came, as asserted by the native physicians.

At the island of Vieques, where I had a small number of men (about one hundred), sanitary conditions were perfect. We were well housed and had rain water from a freshly cleaned cistern as our sole water supply. Our sink, generally used, was at a good distance from the building, and the one inside used by the few men who were sick was well drained, was flushed each day and kept at all times partly filled with lime. I only wish to say in this connection that it is my opinion that men in the Tropics are better off in houses than in tents, because of the large rainfall. The gain in general health and strength by all the men while on this island was very marked. I wish to say that it seems to me that it would have been better if a less number of men had been brought into camp together than were present at instruction camps, such as Camp Thomas. And I also believe that practice marches, such as were taken by many of the regiments, were not beneficial to the health and vigor of the troops. I am sure that the small death list of the Fourth Ohio was due not only to the constant care exercised, but also to intelligent management by the officers in charge in not overworking men who were being gradually brought into condition for active service.

THIRD ILLINOIS VOLUNTEER INFANTRY.

Second Brigade, First Division, First Army Corps.

The May report for this regiment is signed by Maj. and Surg. John Bliss Shaw, who makes the following remarks:

Headquarters and twelve companies, constituting the Third Illinois Volunteer Infantry, 49 officers and 942 men, were mustered into service at Springfield, Ill., May 7, 1898. The command left Camp Tanner, Springfield, May 14, 1898, arriving at Camp George H. Thomas, Chickamauga Park, Ga., May 17, 1898. The medical officers were: John Bliss Shaw, major and surgeon; A. F. Lemke, captain and assistant surgeon; C. E. Sterrett, lieutenant and assistant surgeon. The hospital stewards were: E. E. Crill, Arthur W. Morse, Ben V. Caffee. The command was vaccinated at Springfield, Ill. The health of the command has not been good. This is due to the effects of vaccination, pneumonia contracted at Springfield, and having no hospital tents. Upon our arrival at Chicka-

mauga we found it necessary to send 10 cases of pneumonia to St. Vincent's Hospital at Chattanooga. We have had 10 cases of measles, which have been isolated. No serious results have followed. The regimental hospital was opened May 13, 1898.

CONDENSED SICK REPORT FOR MAY.

Mean strength	991
Admissions from command	52
Completed cases	49
Returned to duty	12
Transferred to other hospitals	37
Total	49
Remaining on sick report, in hospital	3

The June report is signed by Maj. John B. Shaw, who makes the following statement:

The Third Illinois Volunteer Infantry has been stationed at Camp George H. Thomas, Chickamauga Park, Ga., during the month. The regiment has received 319 recruits to fill companies to full strength. All recruits were immediately vaccinated upon arrival at this camp.

On June 15 S. O. 45 was issued from headquarters of the First Army Corps detailing all hospital stewards and privates to report to headquarters for duty. Hospital Steward Morse and Private York were assigned to regimental duties.

The health of the command has not been good and is attributed to the fact of the extreme heat, to the fact that the food is not properly cooked, to the scarcity of drinking water, and to the absence of bathing facilities. Since June 25 we have enjoyed fine bathing in a bath house erected by the Army and Navy League and provided with every facility for shower baths. The prevailing diseases are pneumonia (contracted at Springfield), typhoid fever, measles, and mumps, which were promptly isolated.

CONDENSED SICK REPORT FOR JUNE.

Mean strength	1,057
Admissions:	
Remaining from last month	3
From command	51
Otherwise	2
Total	56
Returned to duty	12
Died	1
Transferred to other hospitals	39
Total	52
Remaining on sick report:	
In hospital	3
In quarters	1
Total	4

In the July report Surgeon Shaw states:

The health of the command has not been good. There has been an insufficient supply of drugs; the food supply has not been suitable to the hot climate. The abolition of regimental hospital has had a bad effect on the men, as they did not wish to be separated from their command. It has been impossible to keep correct reports on account of our frequent movements during this month. The principal diseases have been typhoid fever, enteric fever, and malarial fever.

The mean strength for this month is given at 1,323. There are no data of value in this report.

This regiment left Chickamauga Park, Ga., July 22, and proceeded to Porto Rico.

In the August report Major Shaw offers the following remarks:

The regiment is stationed in the field near Guayama, P. R. The health of the command has been fair, considering the fact that the men were not acclimated and that this is the hot and rainy season of the year. I would recommend regularly examined and more competent army cooks to prevent alimentary disturbances that are produced by poorly cooked food. The manner of serving the food should be a matter of investigation. In some instances it is served in such a shape that it is disgusting to the men.

The average strength for August is given at 1,310. It is merely stated that the report contains 146 completed cases.

In the August report Major Shaw makes the following statement:

The health of the command has been poor this month, due in part to poor camp location, poor food, lack of drugs, and rainy weather. The prevailing diseases have been typhoid, tropical typhoid, and malarial fever.

The malarial fever was caused by decomposing matter, emanating from the cane fields in the near vicinity, and by overturning the soil to beautify the company streets in compliance with orders from general headquarters. During the month of September the regiment remained in camp near Guayama.

The mean strength is placed at 1,304.

In the October report Major Shaw remarks:

The regiment remains encamped in the field near Guayama, P. R. The health of the command has been much improved. This has been partly due to change of location of the camp to a higher and better camping place, and to the fact that the men have received their pay, and thus have been enabled to purchase food suitable for them.

The mean strength is placed at 1,315.

The November report is signed by Major Shaw, with the following remarks:

The troops having become partly acclimated enjoyed good health, except a few cases of typhoid fever and malarial fever. We left Porto Rico November 3, 1898, just three months after landing. We embarked on board the transport *Roumania*. This transport was lacking in nothing for comfort of troops, and all officers vied with one another to make our voyage a safe and comfortable one. Each man was provided with a hammock, which proved very beneficial. The sick bay was large, airy, and well lighted. All the men were provided with wire cots and good, clean bedding. These were placed on board before we left Porto Rico. We were also well provided with live poultry and eggs, purchased with the regimental fund. The Red Cross Society gave us soups, all of which were given to the patients. The large, roomy sick bay enabled us to bathe all patients when the temperature rose above 102° F. For this and other reasons our patients were much more comfortable. The following have died during the month:

Private W., of Company G, with typhoid fever, November 2.
 Private J., of Company G, with typhoid fever, November 11.
 Private K., of Company C, with typhoid fever, November 15.
 Private H., of Company H, with appendicitis, November 15.
 Private S., of Company G, with dysentery, November 22.
 Private D., of Company D, with typhoid fever, November 25.
 Private K., of Company A, with inflammation of the bowels, November 25.

On November 11 the regiment was granted a sixty-day furlough.

This regiment arrived at Chickamauga Park, Ga., May 17, with two probable cases of typhoid fever. Both of these belonged to Company C; both were diagnosed enteritis and were sent to St. Vincent's Hospital,

Chattanooga. There is no further record concerning the disposition of these patients. From the time of its arrival, throughout its stay at Chickamauga, cases of enteritis were quite common. Some of these were recognized as typhoid fever after they had been transferred to the division hospital. We will not give a complete list of the recognized and probable cases of typhoid fever in this regiment, but instead we will give a summary of the cases which occurred before and after the regiment left Chickamauga. There were 60 probable cases of typhoid fever in the regiment before July 22, the date when it left Chickamauga Park. Of these 60 cases of probable typhoid fever, 15 were recognized as typhoid either in the regimental or in the hospital report, while 45 show some other diagnosis. The diagnosis most popular, apparently, in this regiment was enteritis. Most of the patients taken sick at Chickamauga were sent to hospital with a diagnosis of enteritis. It will thus be seen that this regiment became quite widely infected with typhoid fever during its stay at Chickamauga; indeed, as we have already stated, there can be little doubt that the regiment reached Chickamauga infected with typhoid, but the infection had become quite widespread at the time of its departure from this place.

When the regiment left Newport News, July 27, it sent 22 cases of undiagnosed fever to the Marine Hospital. All of these proved to be cases of typhoid, and of course all were infected at Chickamauga. From July 27, the date of sailing for Porto Rico, to August 14, there appear on the records 64 cases of prolonged fever; 20 of these are diagnosed typhoid, 24 malaria, 13 diarrhea, and 7 enteritis. It would seem that by August 14, twenty-two days after leaving Chickamauga, all cases infected at Chickamauga should have manifested some symptoms of the disease. We will now endeavor to ascertain whether or not typhoid fever diminished immediately after the period of incubation had been passed since leaving Chickamauga.

From August 15 to 31, inclusive, 89 cases of protracted fever appeared in the regimental sick reports. All of these were sent to hospital or placed on hospital ships and were returned to the United States. We have not been able to obtain the records of the various hospitals to which these patients were sent. We will therefore be compelled to accept the regimental diagnoses. Of the 89 cases of protracted fever originating from August 15 to 31, inclusive, 60 were recognized by the regimental surgeon as typhoid fever. It is true that they were not all diagnosed as typhoid, for some of them are entered under the diagnosis of enteric fever and some are recorded as continued fever. We think it only fair, however, to regard all of these as recognized cases of typhoid fever. There were 18 cases of malaria, 8 of diarrhea, and 3 of enteritis. It will thus be seen that 60 cases of undoubted typhoid fever occurred in this regiment during the latter half of August. We must therefore conclude that the removal

of the camp from Chickamauga and the voyage to Porto Rico did not relieve this regiment of its typhoid-fever infection.

From September 1 to 15, inclusive, there were in the regiment 126 cases of protracted fever. Six of these were recognized as typhoid, 88 are registered as malaria, 29 were diagnosed diarrhea, and 3 are registered under the diagnosis of enteritis. From this record it would appear that from six to eight weeks after the regiment left Chickamauga the number of new typhoid fever cases gradually decreased.

From September 15 to 30, inclusive, there were 95 cases of protracted fever in the regiment. Typhoid fever does not occur in the record. Twenty-one cases are registered as undetermined fevers and 84 cases are diagnosed malaria. It is more than probable that some of the cases designated as undetermined fever were really cases of typhoid. It would certainly be unsafe to conclude from this record that typhoid fever disappeared from the regiment.

From October 1 to 14, inclusive, there are in the regimental records a register of 57 cases of protracted fever. Thirteen of these are recorded as typhoid fever, 39 are designated as malaria, and 5 are diagnosed diarrhea. It will be seen from this that typhoid fever continued in the regiment up to the middle of October, and we will trace it to a later date.

From October 15 to November 4, inclusive, there are 33 cases of protracted fever given in the regimental records. Of these, 13 are recognized as typhoid, 15 as malaria, 2 as diarrhea, and 3 enteritis.

Notwithstanding the apparent break in the existence of typhoid fever during the month of September, we think it is quite certain that typhoid fever continued quite uninterruptedly in this regiment throughout its different encampments and until it returned to the United States and was disbanded.

We may make the following summary concerning the protracted fevers in this regiment:

Protracted fevers at Chickamauga:	
Recognized typhoid fever	15
Otherwise diagnosed	45
Total	60
Protracted fevers at Newport News:	
Recognized typhoid fever	22
Protracted fevers in Porto Rico from July 28 to August 14:	
Recognized typhoid fever	20
Malaria	24
Diarrhea	13
Enteritis	7
Total	64
Protracted fevers in Porto Rico from August 15 to 31, inclusive:	
Recognized typhoid fever	60
Malaria	18
Diarrhea	8
Enteritis	3
Total	89

Protracted fevers in Porto Rico from September 1 to 15:

Typhoid fever.....	6
Malaria.....	88
Diarrhea.....	29
Enteritis.....	3
Total.....	126

Protracted fevers in Porto Rico from September 15 to 30:

Typhoid fever.....	0
Undetermined fever.....	21
Malaria.....	74
Total.....	95

Protracted fevers in Porto Rico from October 1 to 14:

Recognized typhoid fever.....	13
Malaria.....	39
Diarrhea.....	5
Total.....	57

Protracted fevers in Porto Rico from October 15 to November 4, inclusive:

Typhoid fever.....	13
Malaria.....	15
Diarrhea.....	2
Enteritis.....	3
Total.....	33

The number of recognized cases of typhoid fever in this regiment from the time of its enlistment to the time when it was mustered out of service will be shown by the following table:

At Chickamauga.....	15
At Newport News.....	22
In Porto Rico.....	112
Total.....	149

The total number of cases of protracted fevers from the time of its enlistment to the time when it was mustered out of service will be shown by the following table:

At Chickamauga.....	60
At Newport News.....	22
In Porto Rico.....	464
Total.....	546

SUMMARY.

Assembled at Camp Tanner, Springfield, Ill., in April, 1898.	
Mustered into United States service May 7, 1898.	
Arrived at Chickamauga Park May 17, 1898.	
Strength on arrival 991.	
Date of first case of probable typhoid fever May 17, 1898.	
Date of first case of recognized typhoid fever June 28, 1898.	
Left Chickamauga Park July 22, 1898.	
Strength on departure 1,321.	
Number of cases of probable typhoid fever developed at Chickamauga.....	60
Arrived at Newport News July 23, 1898.	
Left Newport News July 27, 1898.	
Number of cases of probable typhoid fever developed at Newport News.....	22
NOTE.—We have not been able to ascertain the date when this regiment reached Porto Rico.	
Number of cases of protracted fever developed during voyage and after reaching Porto Rico:	
From July 28 to August 14.....	64
From August 15 to 31.....	89
During September.....	221
From October 1 to November 4.....	90
Total number of cases of protracted fever reported in this regiment.....	546

These 546 cases were diagnosed as follows:

Typhoid fever.....	149
Undetermined fever.....	21
Malaria.....	303
Diarrhea.....	57
Enteritis.....	16
Total.....	546

The following is an alphabetical list of the total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Allen, Arthur F.....	Pvt., B.	1898. Oct. 28	Guayama, P. R.....	Tropical typhoid fever.
Almond, Charles E.....	Lt., H.	May 27	Chattanooga, Tenn.....	Pneumonia.
Beebe, Edgar D.....	Pvt., G.	May 15	Springfield, Ill.....	Cerebro-spinal meningitis.
Bradish, L. Burton.....	Corpl., A	Oct. 23	Hospital ship <i>Missouri</i>	Typhoid.
Carpenter, Justus A.....	Pvt., E.	Nov. 1	Elgin, Ill., on furlough	Exhaustion, resulting from privation and disease.
Carroll, John H.....	Sgt., M.	Aug. 27	Rochelle, Ill.....	Spinal fever.
Campbell, Irwing R.....	Corpl., C	Aug. 14	Hospital ship <i>Relief</i>	Typhoid.
Callison, Joseph L.....	Pvt., M.	Sept. 18	Guayama, P. R.....	Do.
Cary, Harry V.....	Corpl., L	Sept. 1	do.....	Do.
Church, Charles W.....	Pvt., I.	Oct. 10	Ponce, P. R.....	Do.
Coburn, Clare E.....	Pvt., E.	Sept. 23	Guayama, P. R.....	Do.
Damon, Henry B.....	Pvt., D.	Nov. 25	Chicago, Ill.....	Do.
Daniels, Lester F.....	Pvt., A.	June 8	Chickamauga, Ga.....	Pneumonia.
Dyer, Robert.....	Sgt., I.	June 8	do.....	Acute lobar pneumonia.
Fallon, William.....	Pvt., K.	Dec. 30	Chicago, Ill.....	Typhoid.
Flora, Vincent I.....	Pvt., L.	Aug. 6	Camp Thomas, Ga.....	Do.
Grace, Thomas R.....	Pvt., G.	Oct. 1	Hospital ship <i>Missouri</i>	Do.
Hayes, Charles M.....	Pvt., M.	July 20	Camp Thomas, Ga.....	Typhoid.
Hennis, Christ.....	Pvt., I.	Sept. 22	do.....	Remittent malarial fever.
Holland, Martin.....	Pvt., M.	Sept. 8	Guayama, P. R.....	Typhoid.
Hooley, Jerry F.....	Pvt., M.	Nov. 19	Chicago, Ill.....	Appendicitis.
Huffman, Herman.....	Pvt., K.	Aug. 7	Arroyo, P. R.....	Shot on outpost.
Jensen, Christian.....	Pvt., G.	Nov. 11	Bedloes Island, N. Y.....	Typhoid.
Killefer, Frank F.....	1stsgt., A	Nov. 25	Streator, Ill.....	Inflammation of bowels.
Kraus, William H.....	Pvt., C.	Nov. 15	Mercy Hospital, Chicago, Ill.	Typhoid.
Landman, Emmanuel.....	Corpl., F	Sept. 28	Philadelphia, Pa.....	Do.
Leland, Robert M.....	Pvt., C.	May 16	Springfield, Ill.....	Cerebro-spinal meningitis.
Lindell, Bert J.....	Pvt., H.	June 4	Camp Thomas, Ga.....	Pneumonia.
Lillie, Luman B.....	Corpl., K	Aug. 24	Guayama, P. R.....	Typhoid and malaria.
McCay, Albert P.....	Pvt., C.	Oct. 7	do.....	Malaria, heart failure.
McCune, Brice J.....	Corpl., A	Oct. 3	Newburg, Pa.....	Chronic gastritis and chronic diarrhea.
Matheny, William L.....	Pvt., F.	Sept. 10	Guayama, P. R.....	Typhoid.
Osmanon, Otto C.....	Pvt., C.	July 26	Fort Monroe, Va.....	Typhoid.
Peters, Claude W.....	Pvt., A.	Aug. 23	do.....	Malarial fever.
Potter, Harry T.....	Pvt., H.	Sept. 3	Guayama, P. R.....	Paralysis.
Paxton, James W.....	Pvt., H.	Oct. 30	do.....	Appendicitis.
Shular, Edward C.....	Pvt., C.	June 26	Chickamauga, Ga.....	Typhoid, complicated by meningitis.
Smith, Oscar J.....	Pvt., I.	Aug. 27	do.....	Typhoid.
Stratton, Wm. I.....	Pvt., G.	Nov. 22	Greenwood, Ill.....	Dysentery.
Shaw, Fred.....	Pvt., I.	Aug. 23	Guayama, P. R.....	Typhoid.
Stevens, Oliver L.....	Pvt., G.	Oct. 6	do.....	Remittent malarial fever.
Smith, John A.....	Pvt., C.	Aug. 30	do.....	Typhoid.
Vining, Wilkie L.....	Pvt., L.	Sept. 21	do.....	Do.
Woodward, Edward A.....	Pvt., G.	Nov. 2	Guayama, P. R.....	Do.

Total Deaths.....	44
Deaths due to typhoid fever.....	25
Percentage of deaths among cases of protracted fever (546).....	4.57
Percentage of deaths among recognized cases of typhoid fever (149).....	16.77

It is probable that the cases of Carpenter, Killefer, McCune, and Stratton were in reality typhoid fever.

If these be added to the typhoid cases the percentage would be markedly increased.

COMMUNICATIONS FROM THE SURGEONS OF THE THIRD ILLINOIS VOLUNTEER INFANTRY.

Medical officers.

John Bliss Shaw, major and surgeon, Joliet, Ill.
August F. Lemke, captain and assistant surgeon, Chicago, Ill.
Carlton E. Starrett, lieutenant and assistant surgeon, Elgin, Ill.

Captain and Assistant Surgeon Lemke makes the following statement:

My experience with typhoid fever during the last campaign was limited to one camp, viz, Chickamauga Park. My regiment was stationed at Springfield, Ill., about two weeks prior to our mobilization at the park, and while there we had no typhoid cases. Within a week or two after our arrival at Chickamauga we met with scattered cases. Very soon, however, these increased in number with remarkable rapidity, so that aside from the few scattered milder cases that were left in the regimental hospitals of our division (First Division of the First Army Corps), the division hospital to which I was assigned contained from 50 to 70 cases at all times. Our division hospital was made up of three rows of large hospital tents, and an entire row was set apart for the typhoid cases. We kept careful records of all of our cases and wrote the history of each patient, as is customary in hospitals generally, and made notes each day as we made the rounds. I am very sorry that these records are not at my disposal, so that I might be able to give you more definite and reliable information. Our mortality rate was rather low, I should judge from 4 to 6 per cent, although I do not wish you to take this as anything but a mere estimate.

Aside from the fact that almost all of the male nurses, or rather hospital corps men who had never had any experience, had to be taught to give cold baths and ice packs, and that they were not as ready to attend to the petty wants of the sick, we had no great difficulty in taking care of our patients, and I believe that the death rate was only very slightly, if at all, above that that obtained in our hospitals generally.

If I were to make any criticisms at all of the treatment of the sick in the division hospitals I should say that the nursing force was insufficient and poorly trained.

I notice that you desire information particularly concerning the sanitary condition of the camp. The water supply of the First Division at Chickamauga Park was obtained from various sources, but largely from surface wells, which I believe became contaminated after the arrival of the troops, although this is a mere conjecture. Our corps surgeon was particularly cautious and careful with reference to the care of the sinks, and most of them were looked after daily. The excreta from our typhoid patients were allowed to stand in a strong bichloride solution for from fifteen to twenty minutes, and were then emptied into a sink in which we kept plenty of chloride of lime. Many of the regiments enforced a rule that all water used for drinking purposes should be boiled. A great many of the men objected very strenuously to the taste of this water and kept their canteens filled with unboiled water from various sources, but in each case from some surface well. Without any special effort being made to demonstrate our theories we were inclined to believe that flies had much to do with the dissemination of the bacilli, and as for myself I can scarcely see how it was possible that I was infected, inasmuch as I can not recall a single instance when I drank anything but boiled water, tea, or coffee, and I naturally conclude that the flies that swarmed over everything on our mess table were the means of conveying the infection.

I have several records of necropsies that I made at the division

and the Leiter hospitals, but I am sure that these would be of no service to you. The regimental sick reports I feel must all be quite accurate as regards the relative number of typhoid patients, except, perhaps, in the case of some of the regiments from the Southern States where malaria is prevalent.

I noticed that some of the regimental surgeons from these districts persisted in sending us well-advanced cases of typhoid with rose spots, palpable spleens, etc., with the diagnosis of malarial fever. I could not account for this, except on the supposition that in their private practice these surgeons see very much malarial fever and comparatively little typhoid.

FOURTH PENNSYLVANIA VOLUNTEER INFANTRY.

Second Brigade, First Division, First Army Corps.

This regiment, consisting of eight companies, reached Chickamauga Park, Ga., May 16, 1898. The only sick reports which we have been able to find from this regiment are those for May and June. The mean strength for May is given at 640 and that for June at 639.

In the May report Surg. Morris F. Cawley makes the following statement:

Digestive disorders have prevailed in the regiment throughout the month. These have been due to sudden change from a cold to a warmer climate and from the comforts of civil life to the hardships and exposure of army life.

In the June report the surgeon makes no comments.

This regiment left Chickamauga Park, Ga., July 23, and proceeded to Porto Rico. We have not been able to obtain any regimental reports later than that for the month of June.

The first suspicious case of typhoid fever was a private in Company D, who was sent to hospital with diarrhea June 1 and returned to duty June 11; the second was a private in Company B, who reported sick June 3 and returned to duty June 24. Both of these cases were diagnosed typhoid fever. The statement that the first case was returned to duty June 11 must be erroneous. During its stay at Chickamauga 26 probable cases of typhoid fever were sent to division and other hospitals. The only other records which we have from this command have been obtained from the general hospitals to which patients were sent from Porto Rico. In all, we find records of 66 probable cases of typhoid fever in this regiment. Among the completed cases 6 deaths are reported.

This comprises all the information that we have been able to obtain concerning sickness in this regiment.

SUMMARY.

Assembled at Mount Gretna, Pa., in April, 1898.

Mustered into United States service about May 10, 1898.

Arrived at Chickamauga Park May 16, 1898.

Strength on arrival, 640.

Date of first case of probable typhoid fever, June 1, 1898.

Date of first case of recognized typhoid fever, June 1, 1898.

Left Chickamauga Park July 23, 1898.

Strength on departure, 1,294.

Number of cases of probable typhoid fever developed at Chickamauga 26

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Armstrong, Louis E...	Pvt., E.	1898. Sept. 28	Mahanoy City, Pa....	Remittent malarial fever.
Bloomfield, Charles L.	Pvt., C	Aug. 22	Guayama, P. R.....	Typhoid.
Baker, Arthur.....	Pvt., I.	Sept. 1do.....	Do.
Chesterfield, Wm. F..	Pvt., E.	Aug. 29	Brooklyn, N. Y.....	Dysentery.

Total deaths..... 35
Deaths due to typhoid fever..... 24

It is impossible to state the percentage of deaths due to typhoid fever in this regiment, because we have no exact knowledge concerning the number of cases. It is likely that the cases in the above list for which no cause of death is given were due to typhoid fever.

COMMUNICATIONS FROM THE SURGEONS OF THE FOURTH PENNSYLVANIA VOLUNTEER INFANTRY.

Medical officers.

Morris F. Cauley, major and surgeon, Allentown, Pa.
George F. Patteiger, lieutenant and assistant surgeon, Hamburg, Pa.

Major Cauley states:

Our camp at Chickamauga was a model; clean, open, with wide streets, plenty of good food, and well policed. Medical supplies were scant and sometimes entirely wanting. More than one-third of the men had constant diarrhea. The soil of our camping ground was of impervious clay, and here and there were holes, some as large as a stovepipe. These were filled up to prevent the horses from breaking their legs, but after very hard rains they were open again. The heavy rains flooded the latrines, and the water, instead of percolating and flowing through the soil, went through these large openings into a lower stratum, carrying the surface drainage and some of the contents of the latrines. Our supply of water was

obtained from wells and springs. The wells were about 30 feet deep. After heavy rains the water from these wells was cloudy; this, I believe, together with the flies, caused the typhoid fever. I ordered the water boiled, but there were no conveniences for this purpose. The men who drank beer from the canteen escaped, because they did not drink contaminated water. I am surprised that our regiment did not have more cases of typhoid fever. There must have been many mild cases that were not reported, but which helped to spread the contagion.

The men observed the rules of cleanliness, were careful of their diet, and, as a rule, led orderly lives. When the July report should have been made, my regiment was on two transports, and when we landed in Porto Rico I was sick with typhoid fever and could not make a report.

SIXTEENTH PENNSYLVANIA VOLUNTEER INFANTRY.

Third Brigade, First Division, First Army Corps.

In the May report, Maj. James Johnson, in charge, makes the following statement:

The general health of the command is good, and with a plentiful supply of water, which is promised, will continue good. Cerebro-spinal meningitis, of which we have had two cases, appeared also in neighboring regiments, some of their cases proving fatal. A general etiological factor of some importance appears to me to be fatigue and exhaustion of energy, and consequent perverted action of nerve centers. The regiment is composed of eight companies and has three medical officers. It was mustered into service at Camp Hastings, Mount Gretna, Pa., May 11, 1898. The command left this place for Camp George H. Thomas, Chickamauga Park, Ga., May 15, arriving May 17.

CONDENSED SICK REPORT FROM MAY 11 TO MAY 31, INCLUSIVE.

Mean strength	628
Diarrhea.....	4
Other diseases	15
Total	19

In the June report, Lieut. H. W. Thayer, in charge, makes the following statement:

A considerable amount of sickness in this regiment during June, causing disability, partial or total, was due to the fact of the men being vaccinated, and several cases of phlegmonous inflammation resulting therefrom. Most of these cases are well or convalescent. No deaths have occurred and there has been but one case of a contagious disease. This was a case of measles, which was promptly isolated, and stringent measures have been taken to prevent the spread of this disease.

CONDENSED SICK REPORT FOR JUNE.

Mean strength	703
Diarrhea	21
Gastritis	1
Catarrhal fever.....	1
Pernicious malaria.....	8
Other diseases.....	35
Total	66

There is no report from this regiment for the month of July.

In the National Guard this was a two-battalion regiment. The Third Battalion was added after the regiment reached Chickamauga. The First and Second battalions went to Porto Rico via Charleston, and the Third went to Newport News, then to Camp Meade, and finally to Porto Rico.

Condensed sick report of Companies B, M, L, and G, constituting the Third Battalion of the Sixteenth Pennsylvania Volunteer Infantry, from August 8 to August 31, 1898, with the Second Army Corps.

Mean strength	510
Typhoid fever.....	20
Chronic diarrhea.....	2
Acute gastritis	1
Intermittent malaria.....	3
Malaria.....	2
Gastro-enteritis	3
Other diseases.....	5
Total	36

In September the Third Battalion left Camp Meade and went to Porto Rico.

Condensed sick report of Companies B, M, L, and G of the Sixteenth Pennsylvania Volunteer Infantry, at Ponce, P. R., for the month of September.

Mean strength	482
Typhoid fever.....	13
Gastro-enteritis	3
Enteritis.....	2
Gastritis.....	4
Malaria.....	23
Diarrhea.....	4
Other diseases.....	6
Total	55

In this report Acting Assistant Surg. Joseph G. Wilson in charge makes the following statement:

I believe that the typhoid fever and malaria from which we have suffered were principally contracted at Chickamauga and Newport News. During the month this detachment has been at Camp Meade, Pa., and at Ponce, P. R. At the former place we had three privy sinks; each man was required to cover his own stool; guards were posted at these sinks to see that this order was obeyed. Each company was provided with a kitchen sink. The drinking water was ordered to be filtered. The dishes were washed in hot water after each mess. Blankets were aired until 11.30 o'clock each morning. Every tent had a board floor. En route from Camp Meade to Ponce there was a great deal of seasickness. I believe that the patients who were transferred to the general hospital at Ponce had their resisting power to disease diminished by the severe seasickness which prevailed and by the irregular times of eating, together with the poor quality of food served on board the transport *Obdum*. Since our arrival at Ponce we have all been drinking water boiled or filtered, and we use the same sanitary precautions that we used while at Camp Meade.

There are no reports from the First and Second battalions after they left Chickamauga. It will thus be seen that our information concerning this regiment is

exceedingly fragmentary. From the various hospital records we have been able to find 118 cases of probable typhoid fever from this regiment. Most of these are left incomplete and still sick in hospital. Among the completed cases 4 deaths are reported.

The only lesson that we are able to learn from this regiment is that the Third Battalion became infected quite seriously with typhoid fever at Chickamauga; it retained this infection at Newport News and at Camp Meade, and carried it to Porto Rico. To our minds this is proof quite positive that change in location is not sufficient to relieve troops infected with typhoid fever of the disease. The infection is carried from camp to camp in the bodies of the soldiers, in their clothes, and on their bedding and tents. After troops become badly infected with typhoid fever the thorough disinfection of all their belongings is necessary in order to stamp out the disease.

SUMMARY.

Assembled at Camp Hastings, Mount Gretna, Pa., in April, 1898.

Mustered into United States service May 11, 1898.

Arrived at Chickamauga Park May 17, 1898.

Strength on arrival, 628.

Date of first case of probable typhoid fever May 8, 1898.

Date of first case of recognized typhoid fever June 20, 1898.

Left Chickamauga Park July 6, 1898.

Strength on departure, 865.

Number of cases of probable typhoid fever developed at Chickamauga..... 17

It is more than probable that this regiment developed typhoid fever at Mount Gretna, Pa. The suspicious cases up to May 17, 1898, are as follows:

No. 1. Company A: Diarrhea, May 8 to June 15.

No. 2. Company H: Diarrhea, May 10 to June 15.

No. 3. Company K: Diarrhea, May 17 to June 2.

Apparently these sick men accompanied the regiment to Chickamauga. The absence of the July report leaves us without information concerning the effect of the removal to Charleston and Newport News upon the number of cases of typhoid fever. However, judging by the histories of other regiments that made the same move and by the subsequent history of the Third Battalion of this regiment, we may be quite certain that the number of cases did not materially decrease. The Third Battalion carried the typhoid infection from Chickamauga to Newport News, then to Camp Meade, and later across the seas to Porto Rico. The history of this battalion alone makes us skeptical of the belief held by some army medical officers that a command widely infected with typhoid fever loses this infection on moving to an uninfected locality. We think that when other facts on these points have been gathered, from a study of this disease it will be conclusively demonstrated that the above-mentioned belief is erroneous.

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Barney, John S.....	Pvt., A.	1898. Aug. 15do.....	Exhaustion following typhoid.

Total deaths..... 41
Deaths due to typhoid fever..... 34

We can not give the percentage of deaths in this regiment, because we have been unable to ascertain the total number of cases.

COMMUNICATIONS FROM THE SURGEONS OF THE SIXTEENTH PENNSYLVANIA VOLUNTEER INFANTRY.

Medical officers.

James Johnston, major and surgeon, Bradford, Pa.
Henry W. Thayer, lieutenant and assistant surgeon, Corry, Pa.
William G. Johnston, lieutenant and assistant surgeon, Titusville, Pa.

Under date of July 17, 1899, Major Johnston furnishes us with the following valuable information:

I was ordered away from my regiment for duty in the ambulance service early in June while at Camp Thomas. Later, I went to Porto Rico with a detachment of the Hospital Corps, which constituted the ambulance company of Gen. James H. Wilson's command, and although my regiment was on the same transport and I was medical officer in charge on board the boat, I did not resume charge of affairs in the regiment, but left the books and reports to my assistant, who continued to be acting surgeon of the regiment throughout the campaign in Porto Rico and until our return to New York. We had no cases of fever at Mount Gretna and very few at Chickamauga. The records of the hospital of the First Division, First Army Corps, at Chickamauga must show that there were scores of cases of typhoid fever from other regiments before there was a case from ours. Our first death in the service was reported in Charleston, and as having occurred in a case that

was left behind and that had not been long in hospital. We had a number of cases of fever while in Charleston. These were left behind in the hospital at that place.

We realized before we left Charleston that we were infected with typhoid fever. There was no typhoid fever in that city at the time of our arrival, and no other explanation that could be offered appeared at all likely in comparison with the explanation that we had brought it with us from Chickamauga. We were in Charleston for more than two weeks. Our men were quartered in cotton warehouses along the water front. The heat was severe, but duty was light. The men ate and drank freely and enjoyed their stay at this place more than that of any other part of the service. They ate freely of fruits as of everything else in the markets. Although they were on travel rations and had already discovered the abominable character of the canned meats, they did not suffer much from that cause at the time, because the regular issue was almost wholly ignored. This was largely due to the extreme generosity of the citizens of Charleston. Every door was open to the soldiers, and those who did not buy their meals at public tables deserted their company mess for private houses, where they were welcomed at the table as guests of the family.

The drinking water was of excellent quality, but a great many also drank more or less freely of whisky and beer. It is worthy of note that a canvass of the companies on their return home after the entire service showed that those who partook of stimulants fared decidedly better than the abstainers. The deaths that occurred were among the teetotalers in a very surprising disproportion.^a

The heat was the one great trouble in Charleston. Temperatures were actually recorded as high as 104 degrees at midnight inside of the brick buildings in which the troops were quartered.

Those who were best behaved were permitted to find cooler quarters, but at the same hour the temperature was 85 degrees at the end of the wharf and the differences in humidity appeared to be so much greater that it amounted to an offset to the lower temperature. As a matter of fact men who did not know what the thermometer registered hardly knew which place to choose.

Our men were not overworked at Charleston, but before leaving they were given two long practice marches. However, except for these two occasions the work performed amounted to almost nothing. The men had abundant opportunity to bathe themselves and wash their clothing. It would be impossible to find men in cleaner condition than ours were during the two weeks' stay in Charleston. They bathed in the slips and along the wharves and at the floating bath house around the point. There were in addition sprinkling hydrants on the docks, at each of which half a dozen men could be showered at once. These shower baths were kept going at full head every evening until taps, when the officers took their turn. There were scores of colored laundresses soliciting washing and mending, and I fully believe that every man in the brigade availed himself on his arrival, and again before leaving took advantage of the last opportunity to leave for the front with a perfectly clean equipment.

When we discovered that the cases that we had sent to Charleston hospitals were typhoid fever, we consulted with the doctors in the city who were in charge of them as to the probable causes and origin of the disease. It was unanimously decided that the disease had been brought with us from Chickamauga, and in what way? Facts seem to us to exclude everything except the interior of the men's bodies as a carrying place of the germ.

The men's clothing was never cleaner. They were not using tents. Their toilet conveniences were far superior to what they had in the field. They were not using one another's forks and spoons. They were not even chewing one another's tobacco, for the reason that all were well equipped and supplied, and two months' service had made each man self-reliant enough or his friends selfish enough so that they did not do these things through

^aThis is not in accord with the views of most surgeons who served in Cuba and Porto Rico.

pure sociability. The Second and Third Wisconsin Regiments were under exactly the same condition as the Sixteenth Pennsylvania. These three regiments were together in Charleston and served in the campaign together in Porto Rico as the First Brigade of the First Division of the First Army Corps under Brigadier-General Ernst. They had similar experiences throughout. The histories of their sick are to be found with ours in the records in the hospital at Ponce, which was first called a transfer hospital under the charge of Doctor Ten Eyck and later made a United States general hospital in charge of Major Birmingham, and in the records of the field hospital of the First Brigade under Acting Asst. Surg. J. W. Wright, of Bridgeport, Conn. The latter was afterwards made a division hospital at Coamo in charge of myself first and afterwards of Maj. J. B. Palmer, of the First Kentucky Volunteer Infantry.

The idea that the typhoid germs were carried along in the intestinal canal from Chickamauga to Porto Rico appeared to me to receive marked confirmation in the peculiarity of its behavior. It is evident to me that the germ showed a long-continued action on a limited portion of the bowel, so that the epidemic as a whole had more of the characteristics of a local than of a general disease. We had a very unusual percentage of ambulatory cases. There was also an unusual percentage of hemorrhages and nearly 50 per cent of deaths resulted from perforation. I have now in my possession notes on the deaths that occurred during my administration of the division hospital at Coamo. Previous to August 26 I was in command of the ambulance company, and after relinquishing charge of this hospital, on account of being ill with fever, I was acting brigade surgeon.

There is no reason to suppose that these notes are not fair illustrations of the type of the disease that existed throughout the brigade.

Case 1. Corpl. John L. Kingston, Company L, Second Wisconsin, admitted August 26. Although wasted in condition this man had been doing full duty and had only returned from outpost on the evening before admission. He was in collapse on admission and died in a few hours. Examination showed a single large perforation, and the peritoneal cavity was filled with bowel contents. The bowel at other points was healthy.

Case 2. Private Erwin M. Kerns, Company C, Sixteenth Pennsylvania. This case was almost exactly identical with the above. This man had been failing in flesh for some time, but had been ill in quarters in his regiment and was not brought to the hospital until perforation had occurred. Both of these men were above the average age for enlisted men, being between 35 and 40 years.

Case 3. G. C. Edwards, quartermaster-sergeant, Third Wisconsin, admitted August 31, 1898. Post-mortem examination showed the liver slightly enlarged, spleen twice its normal size and mesenteric glands enlarged. Peyer's patches enlarged and ulcerated. This was a typical case of typhoid fever.

Case 4. James Wallace, particulars missing.

Case 5. Frank B. Loomis, Company F, Third Wisconsin, age 25 years, died September 8, 1898. Examination showed several perforations and many large ulcers.

Case 6. George B. Sloan, Company K, Sixteenth Pennsylvania, died September 8, 1898, age 25 years. The spleen and mesenteric glands were much enlarged and Peyer's patches were ulcerated.

Case 7. James Turner, Company L, Third Wisconsin, age 21. Examination showed bowels ulcerated and filled to distension with blood.

Case 8. Corpl. Sumner P. Bartlett, Company E, Third Wisconsin, age 29. Post-mortem showed typical typhoid ulceration.

Case 9. Private William H. George, Company K, Sixteenth Pennsylvania. Examination showed liver, spleen, stomach, heart, kidneys, and large intestines normal. Tubercular areas were found in the apices of both lungs, and similar ulcerations were found in the larynx and small intestines.

Case 10. Clayton Damon, Company A, Sixteenth Pennsylvania, age 18 years, died September 11, 1898. Post-mortem examination

showed pin-hole perforation of ileum, Peyer's patches and solitary glands showed ulcers in reparative stages. There was general peritonitis.

Case 11. C. L. McArthur, Company L, Third Wisconsin, died September 11, 1898, age 28 years. Post-mortem showed ulceration of bowels.

Case 12. Edward Wachter, Company H, Third Wisconsin, died September 18, 1898, age 22 years. Post-mortem showed liver, spleen, and mesenteric glands enlarged, and gangrenous ulceration of Peyer's patches.

Case 13. James H. Gamble, Company F, Third Wisconsin, died September 20, 1898, age 32 years. Examination showed mesenteric glands enlarged and Peyer's patches ulcerated.

Case 14. Lester A. Dinsmore, Company I, Sixteenth Pennsylvania, died September 22, 1898, age 28 years. Post-mortem showed kidneys, spleen, and liver normal. There were ulcers in the intestines, some of which had nearly perforated.

Case 15. Harry F. Ransom, Company A, Sixteenth Pennsylvania, died September 30, 1898. Perforations were found in the smaller intestines, and the large intestine was gangrenous.

Case 16. Charles Sunderlin, Company H, Third Wisconsin, died October 2, 1898. Notes missing.

Case 17. Edward S. Bailey, Company C, Sixteenth Pennsylvania, died October 2, 1898. Post-mortem showed liver, spleen, and mesenteric glands enlarged. There was meningitis with effusion.

These are all the cases of which I have records, with the post-mortem reports handed into my office by different surgeons. Leaving cases Nos. 4, 9, and 16 out, we have 14 reports of post-mortem examinations in typhoid fever, 5 of which were distinct cases of perforation. Cases 7, 8, and 14 were of equally local character. This is certainly out of proportion to the experience of the best-known writers on typhoid fever. Those that I have consulted on this point show from 2 to 12 per cent of perforation. Hemorrhage is said by the same authorities to occur in from 3 to 8 per cent of cases. I am sure that our proportion was very much greater than this, but we had no deaths from these causes and consequently I have no records. Our records of symptoms and treatment are scattered and incomplete, for the reason that there was so much else to do that it was impossible to collect these reports in a suitable manner. We were always short of clerical help and stationery. It was my custom, made necessary by circumstances, to give to each medical officer on duty at the hospital a book in which he might make his own daily record for his own use and in his own style. He retained this book in all his changes of assignment and made only the return to the hospital that was required for the monthly reports to the Surgeon-General. During the time that I was in charge of the division hospital at Coamo we had an average daily list of patients amounting to 198, and at one time we reached 338. Our help was almost as fluctuating as our patients, being mostly unwilling details from regiments. We were 25 miles inland from our base of supplies, and had to bring out everything in wagons, so that we were fully occupied with the needs of time and had little opportunity to profit in a professional way by our experience or to put our observations in shape for future use.

When the brigade advanced from Coamo across the island to San Juan we took a part of the division hospital along as a field hospital. On this march the men braced up and there was very little sickness of any kind. The weather was extremely wet, but we reached higher ground and breathed a more salubrious air. We were then ordered home, and turned back and met our third battalion at Ponce.

Before embarking at Ponce all men with a temperature of above 100 degrees were left behind and sent to hospital. When we landed at Jersey City 6 men of our regiment were carried to hospital. One of these subsequently died and I notice that his case is marked typhoid fever. He was taken ill on the 16th of October, one day out from New York, and had been feeling well until that time. He was orderly to the general throughout the campaign and on the boat up to the time when he was taken ill. He had

not endured the hardships nor shared the fare of the men in the ranks, and on the boat his quarters were above deck, and his duties almost nothing. Late at night on October 15 he suddenly fell ill, and had a weak pulse and complained of being dizzy. I saw him at this time and ordered him some aromatic ammonia. The next day in the afternoon he applied for treatment in the hospital, and the surgeon on duty evidently did not recognize typhoid fever, although his temperature was 102.6 degrees. That evening his temperature rose to 104.2 degrees, and the next morning it was 102.2 degrees. I then prescribed quinine and salol. He looked ill and evidently felt ill, but he had none of the signs of typhoid fever, and I confess that I was shocked to learn that he had died, especially in so short a time after he left us. We had about 50 sick in the hospital on the transport on our return from Porto Rico, but I believe that the man above referred to was the only one that died. In this case the difficulty in accounting for typhoid fever is so great that in connection with his unusual symptoms I feel that there should have been post-mortem proof of the existence of the disease. He had been traveling for sixteen days in very comfortable circumstances in the company with older and perfectly healthy men, and while I do not suppose that it is necessary or possible to account for every case, yet I feel that to understand this one would probably give us information of value concerning the nature of typhoid fever.

SECOND WISCONSIN VOLUNTEER INFANTRY.

Third Brigade, First Division, First Army Corps.

This regiment was mustered into service at Camp Harvey, near Milwaukee, Wis., May 12, 1898. It left Camp Harvey May 15, and arrived at Camp George H. Thomas, Chickamauga Park, Ga., May 17. The regiment, at the time of its arrival at Chickamauga Park, had a mean strength of 1,024.

The first sick report covers the period from May 12 to 31, inclusive. There were only six cases recorded in this report; one of these was a case of diarrhea of three days' duration; the other five cases were not intestinal disorders or fevers. However, the June report shows a case of remittent malaria, the initial date of which was May 11.

In the June report First Lieut. Frank C. Moulding, acting surgeon, makes the following statement:

The prevailing disease is malarial fever, either remittent or intermittent, and malarial poisoning, debilitating the men in the extreme. This is due to the fact that the country around Chickamauga Park itself is saturated with malarial germs. The water is insufficient in amount for cooking purposes and washing dishes, and even this insufficient amount of water is abominable, no matter from what source derived. A scum of vegetable matter forms on top of the water while being boiled, and coffee cooked with it has a disgusting smell. The natives were almost unanimous in informing us that any one bathing in Chickamauga Creek for two weeks would surely contract chills and fever; and then this Chickamauga Creek water was conveyed by means of pipes to the camp to wash and bathe in. It is impossible to get a sufficient amount of drinking water of even the poor quality unless the men choose to drink the dirty water from Chickamauga Creek.

CONDENSED SICK REPORT FOR JUNE.

Mean strength	1, 176
Typhoid fever.....	1
Malaria.....	12
Not determined	1
Other diseases.....	15
Total	29

The July report is not accompanied by any comments.

CONDENSED SICK REPORT FOR JULY.

Mean strength not given.	
Typhoid fever.....	42
Malaria.....	118
Diarrhea.....	1
Other diseases.....	40
Total	201

This regiment left Chickamauga Park July 6 and went to Charleston, S. C., en route to Porto Rico. The locations occupied during the month of July were at Chickamauga and Charleston.

The regimental sick report for August bears no comments.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength not given.	
Typhoid fever.....	8
Malaria.....	230
Diarrhea.....	68
Intestinal disorders.....	3
Other diseases.....	20
Total	329

There is no report from this regiment after August.

The following is a list of the recognized and probable cases of typhoid fever in this regiment:

- No. 1. Company A: Remittent malaria, May 11 to 27.
- No. 2. Company G: Malarial fever, May 31; still sick June 30.
- No. 3. Company L: Malarial fever, June 7 to 29.
- No. 4. Company H: Malarial fever, June 7 to 18.
- No. 5. Company K: Malarial fever, June 8 to 28.
- No. 6. Company H: Malarial fever, June 12; still sick June 30.
- No. 7. Company H: Malarial fever, June 16; sent to Fort Thomas July 6. Here the disease was diagnosed typhoid fever, and the patient was returned to duty September 2.
- No. 8. Company H: Malarial fever, June 16; still sick June 30.
- No. 9. Company D: Typhoid fever, June 21; died June 28.
- No. 10. Band: Typhoid fever, June 24; disposition not given.
- No. 11. Company H: Typhoid fever, June 24; still sick in Leiter Hospital July 31.
- No. 12. Company H: Typhoid fever, June 25; still sick in Leiter Hospital July 31.
- No. 13. Company G: Malaria, June 26 to July 15.
- No. 14. Company H: Typhoid fever, June 26; disposition not given.
- No. 15. Company G: Malaria, June 28; still sick in Leiter Hospital July 14.
- No. 16. Company H: Typhoid fever, June 30; transferred to Leiter Hospital July 24.
- No. 17. Company K: Malarial fever, July 1; sent to division hospital July 5. Here the diagnosis was changed to typhoid fever, and the patient was returned to duty August 17.
- No. 18. Company D: Malarial fever, July 1; sent to division hospital July 15. Here the diagnosis was changed to typhoid fever, and the patient was furloughed August 15.
- No. 19. Company E: Malarial fever, July 1 to 20.
- No. 20. Company H: Malarial fever, July 1; sent to Fort Thomas July 6. Here the diagnosis was changed to typhoid fever, and the patient was discharged September 26.
- No. 21. Company D: Malarial fever, July 2; sent to Fort Thomas July 5. Here the diagnosis was changed to typhoid fever, and the patient was discharged October 1.

No. 296. Company H: Malaria, September 5; sent to hospital September 5. Here the diagnosis was changed to typhoid fever, and the patient was discharged October 18.

No. 297. Company H: Malaria, September 8; sent to hospital September 8. Here the diagnosis was changed to typhoid fever, and the patient was discharged September 12.

No. 298. Company M: Malaria, September 12; furloughed October 11.

No. 299. Company C: Malaria, September 12; sent to hospital November 19. Here the diagnosis was changed to typhoid fever, and the patient was still sick November 19.

No. 300. Company C: Remittent malaria, September 12; furloughed from hospital September 22.

No. 301. Company K: Sent to hospital without diagnosis September 12. Here the disease was diagnosed chronic diarrhea and the patient was furloughed September 22.

No. 302. Company F: Sent to hospital without diagnosis September 12. Here the disease was diagnosed malaria and the patient was furloughed September 27.

No. 303. Company F: Sent to hospital without diagnosis September 12. Here the disease was diagnosed malaria and the patient was furloughed October 1.

No. 304. Company C: Sent to hospital without diagnosis September 12. Here the disease was diagnosed malarial fever and the patient was furloughed September 22.

No. 305. Company C: Sent to hospital without diagnosis September 12. Here the disease was diagnosed typhoid fever and the patient was furloughed September 21.

No. 306. Company C: Sent to hospital without diagnosis September 12. Here the disease was diagnosed diarrhea and the patient was furloughed September 23.

No. 307. Company K: Sent to hospital without diagnosis September 12. Here the disease was diagnosed gastritis and the patient was furloughed September 22.

No. 308. Company M: Sent to hospital without diagnosis September 12. Here the disease was diagnosed malarial fever and the patient was furloughed October 21.

No. 309. Company L: Sent to hospital without diagnosis September 12. Here the disease was diagnosed diarrhea and the patient was furloughed September 22.

No. 310. Company A: Sent to hospital without diagnosis September 12. Here the disease was diagnosed malaria and the patient was furloughed September 24.

No. 311. Company B: Sent to hospital without diagnosis September 12. Here the disease was diagnosed chronic diarrhea and the patient was furloughed October 12.

No. 312. Company C: Sent to hospital without diagnosis September 12. Here the disease was diagnosed malarial fever and the patient was furloughed September 24.

No. 313. Company F: Sent to hospital without diagnosis October 5. Here the disease was diagnosed typhoid fever and the patient was furloughed October 14.

No. 314. Company C: Sent to hospital without diagnosis October 5. Here the disease was diagnosed typhoid fever and the patient was furloughed October 10.

No. 315. Company G: Sent to hospital without diagnosis October 5. Here the disease was diagnosed typhoid fever and the patient was furloughed October 8.

No. 316. Company G: Sent to hospital without diagnosis October 5. Here the disease was diagnosed malaria and the patient was furloughed in October, but the exact date not given.

No. 317. Company H: Sent to hospital without diagnosis October 5. Here the disease was diagnosed typhoid fever and the patient was furloughed October 15.

No. 318. Company F: Sent to hospital without diagnosis October 5. Here the disease was diagnosed typhoid fever and the patient was furloughed October 12.

No. 319. Company M: Sent to hospital without diagnosis October 5. Here the disease was diagnosed typhoid fever and the patient was furloughed October 14.

No. 320. Company A: Sent to hospital without diagnosis October 5. Here the disease was diagnosed typhoid fever and the patient was furloughed October 12.

No. 321. Company B: Sent to hospital without diagnosis October 5. Here the disease was diagnosed malarial dysentery and the patient died October 15.

No. 322. Company H: Sent to hospital without diagnosis October 5. Here the disease was diagnosed malaria and the patient was furloughed October 15.

No. 323. Company G: Sent to hospital without diagnosis October 5. Here the disease was diagnosed malarial fever and the patient was furloughed October 15.

No. 324. Company K: Sent to hospital without diagnosis October 5. Here the disease was diagnosed malaria and the patient was furloughed October 15.

No. 325. Company M: Sent to hospital without diagnosis October 5. Here the disease was diagnosed malaria and the patient was furloughed October 15.

No. 326. Company G: Sent to hospital without diagnosis October 5. Here the disease was diagnosed malaria. Further disposition of this patient is not given.

No. 327. Company B: Sent to hospital without diagnosis October 5. Here the disease was diagnosed malarial fever and the patient was transferred to Josiah Simpson Hospital November 19.

No. 328. Company G: Sent to hospital without diagnosis October 5. Here the disease was diagnosed typhoid fever and the patient was furloughed October 14.

No. 329. Company L: Sent to hospital without diagnosis October 5. Here the disease was diagnosed typhoid fever and the patient was furloughed October 8.

SUMMARY.

Assembled at Camp Harvey, Milwaukee, Wis., April 28, 1898.

Mustered into United States service, May 12, 1898.

Arrived at Chickamauga, May 17, 1898.

Strength on arrival, 1,204.

Date of first case of probable typhoid fever, May 11, 1898.

Date of first case of recognized typhoid fever, June 16, 1898.

Left Chickamauga Park, July 6, 1898.

Strength on departure, 1,326.

Number of cases of probable typhoid fever developed at Chickamauga 54

Number of cases of protracted fever developed after leaving Chickamauga:

From July 6-31 118

During August 117

During September and October 40

Total number of cases of protracted fever developed in this regiment 329

These 329 cases were diagnosed as follows:

Typhoid fever 113

Malaria 198

Diarrhea 14

Enteritis 4

Total 329

^a By referring to the list of cases it will be seen that patients from this regiment were sent to Leiter Hospital as late as July 19, although the regiment left Chickamauga July 6. These are cases that were in the division hospital when the regiment left Chickamauga and acquired the disease at that place. This figure, therefore, is less than the actual number that developed at Chickamauga, but as there is no regimental record concerning them we have no means of ascertaining the dates of initial sickness.

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Allan, Ethan	Corpl., D.	1898, July 29	Transport <i>La Grande Duchesse</i> .	Typhoid.
Anderson, Andrew O.	Pvt., M.	Nov. 29
Baer, Charles O.	Pvt., G.	Aug. 18	Fortress Monroe, Va..	Do.
Barger, Alfred	Pvt., A.	Aug. 5	Charleston, S. C.	Do.
Brand, Robert J.	Mus.	July 5	First Division hospital.	Do.
Bartels, Herman	Corpl., A.	July 20	Charleston, S. C.	Do.
Bills, Edward E.	Pvt., B.	July 1	Hospital ship <i>Relief</i> ..	Appendicitis.
Bronson, Theodore	Pvt., A.	Aug. 10	Buried at Ponce	Exhaustion following typhoid.
Caville, Herbert C.	Pvt., H.	July 19	Charleston, S. C.	Typhoid.
Celney, Theodore	Pvt., F.	June 11	Spinal meningitis.
Clemens, Charles.	Mus., B.	Aug. 16	Ponce, P. R.	Typhoid.
Corbery or Corpery, Timothy.	Pvt., L.	Oct. 9	Returned from Porto Rico with company; furloughed from September 10, 1898, to date of death; died at St. Joseph's Hospital, Ashland, Wis.	Cause not given.
Dahl, Leopold	Pvt., A.	July 28	Charleston, S. C.	Typhoid.
Dillon, Curtin J.	Mus., D.	Oct. 10	Ripon, Wis.	Septic meningitis.
Doege, Albert	Pvt., C.	Oct. 2	Typhoid.
Davis, John L.	Corpl., A.	Aug. 10	Ponce, P. R.	Do.
Engel, Fred	Pvt., H.	Aug. 1	Charleston, S. C.	Do.
Edgerton, George L.	Pvt., K.	Aug. 6	Transport <i>Lampassas</i> .	Do.
Fenstermaehrer, E.	Pvt., B.	July 13	Cholera morbus.
Frier, Wm.	Band, M.	Oct. 24	Typhoid.
Frier, William J.	Pvt., M.	Sept. 2	Ponce, P. R.	Malarial fever.
Gustafson, John C.	Pvt., I.	July 17	Leiter Hospital, Ga.	Typhoid.
Hook, William H.	Pvt., H.	May 15	Milwaukee, Wis.	Bowel trouble.
Heyn, William	Pvt., H.	Aug. 5	Hospital ship <i>Lampassas</i> .	Typhoid.
Johnson, Laurel B.	Pvt., D.	Aug. 26	Charleston, S. C.	Do.
Kandt, Otto	Corpl., F.	July 20	Malarial.
Krousnoble, Jacob	(?) A.	Aug. 12	Typhoid.
Kingston, John F., jr.	Pvt., L.	Aug. 26	Camp Coamo, P. R.	Do.
McCourt, Arthur	Pvt., E.	July 25	Charleston, S. C.	Do.
Miskel, Otto C.	Pvt., G.	Aug. 20	Hospital ship <i>Relief</i> ..	Do.
Olson, Haber	Pvt., B.	Oct. 15	Division Hospital	Do.
Fingel, William H.	Pvt., F.	June 14	Fort Thomas, Ky.	Do.
Schwable, Fred	Pvt., H.	July 27	Leiter Hospital, Ga.	Do.
Shipman, Carl E.	Pvt., B.	July 30	Charleston, S. C.	Do.
Shannon, Oscar L.	Pvt., K.	Aug. 31	Ponce, P. R.	Do.
Schuh, John H.	Pvt., G.	July 29	Do.
Van Breda John.	Pvt., A.	Aug. 1	Do.
Wischell, Frank	Pvt., L.	Aug. 2	Leiter Hospital, Ga.	Do.
Ward, Fred S.	Pvt., D.	June 28	Camp Thomas, Ga.	Fever.
Wright, George C.	Pvt., M.	June 21	Cerebro-spinal meningitis.
Wallace, James.	Pvt., G.	Sept. 2	Coamo, P. R.
Total deaths				41
Deaths due to typhoid fever				27
Percentage of deaths among probable cases of typhoid fever (329), 8.20.				
Percentage of deaths among recognized cases of typhoid fever (113), 23.89.				

It is probable that typhoid fever was the cause of death in several additional cases in the above list.

COMMUNICATIONS FROM THE SURGEONS OF THE SECOND WISCONSIN.

Medical officers.

Harry E. Bradley, major and surgeon, Milwaukee, Wis.

Frank C. Moulding, captain and assistant surgeon, Watertown, Wis.

Karl de Sombre, lieutenant and assistant surgeon, Fond du Lac, Wis.

Captain Moulding states:

At Camp Harvey our water supply was obtained from an artesian well and was piped to the camp, so that there was no possibility of its being infected. During the last of April and first of May, while

we were still at Camp Harvey, the weather was very cold, and the men suffered in consequence. The sinks were covered each night and morning in a thorough manner. We had been at Chickamauga Park for about two weeks when an outbreak of typhoid fever occurred. Our regiment was encamped directly over the place where a regiment of regulars had been located previous to our arrival. While in Chickamauga Park we obtained most of our water supply from Crawfish Spring, hauling it a distance of about 5 miles and allowing it to stand in barrels, open for the most part to the germs that might accumulate. A part of our water supply was obtained from an artesian well, about 60 feet deep, near our camp, but the amount obtained here was very small. I endeavored to keep the sinks properly covered, but the nature of the soil was such that this was quite impossible. From Chickamauga we went to Charleston, S. C. There we were encamped in a large cotton warehouse and the sinks were built directly over the salt water. Our water supply was the same as that used in the city and was good.

In Porto Rico we generally obtained drinking water from running streams, and I think it was always good. Typhoid fever followed our regiment throughout the entire campaign and several men died from this disease after they returned home.

Lieutenant de Sombre states:

The regiment was encamped on the fair grounds near Milwaukee for seventeen days. During this time the men had no tents, but were quartered in barns. The sinks were about 30 feet from the barns and the water supply was obtained from an artesian well. The food was wholesome and plentiful. One man died at this place and his death is attributed by Lieutenant de Sombre to over-eating. This must be the case of William Hook, as given in our list of deaths. At Chickamauga the camp site was in the woods, the men were crowded in tents, and it was impossible for them to rest well at night. Food was not good and it was insufficient in amount. Water was obtained from the wells and from Chickamauga Creek. For a while it was brought in barrels from Crawfish Spring. Sinks were just outside of the guard line and were about 4 feet deep. Every time a sink was dug there would be more malarial fever. The principal sickness in this camp was malarial fever. A great many cases reported as typhoid fever I believe to be continued malarial fever. Some surgeons reported typhoid fever if the patient died and malarial fever if he recovered. The regiment was at Chickamauga from May 17 to July 5, during which time sickness constantly increased. From July 7 to 20 the regiment was at Charleston and the men were quartered in cotton sheds which were dry and comfortable. The water was excellent. The sinks were out on the wharves and every discharge fell into the salt water. There was a great deal of sickness at this place after the first week. The sickness is ascribed to exhaustion caused by two forced marches and to the heat. The number of sick increased from 35 to over 200 within four days. At Ponce the regiment encamped on an old sugar plantation. Later the regiment moved to Coamo, while detachments were sent to Adjuntas and Utuado. When the regiment was at Ponce over 100 men were sick. Almost all the illness Doctor de Sombre believed to be due to ptomaine poisoning. Most of the sick had a temperature from 100° to 105° F.

THIRD KENTUCKY VOLUNTEER INFANTRY.

Third Brigade, First Division, First Army Corps.

The May report for this regiment is signed by Maj. Frank Boyd, who makes the following remarks:

The regiment was mustered into service at Camp Collier, Lexington, Ky., May 21, 1898. The medical staff consists of Maj. Frank Boyd, Capt. Austin Bell, and Capt. Nevill M. Garrett.

These men were mustered into the United States service May 10, 1898. Up to this time we have had no hospital and there are no cases of importance calling for special treatment.

This regiment did not reach Chickamauga Park until June 2.

The June report is signed by Capt. and Acting Surg. Austin Bell, who makes the following remarks:

The prevailing diseases for the month were diarrhea, mumps, and measles. Improper cooking and the purchasing of improper articles from hucksters caused the first. A daily rigid inspection of the kitchens, with proper attention to cooking, and prohibiting the sale of undesirable articles, soon checked our diarrhea. We had our contagious cases isolated from the rest of the command, placed guards around them, and kept them there until the infective period had passed. No autopsies have been made.

CONDENSED SICK REPORT FOR JUNE.

Mean strength	1,213
Admissions from command	63
Completed cases	19

It is to be supposed that all of the completed cases were returned to duty, although this is not specified.

The July report is signed by Capt. and Acting Surg. Austin Bell, who makes the following remarks:

The command has been afflicted with German measles and mumps. We have had a few cases of typhoid fever. Malarial fevers have been quite prevalent. Our isolation methods in the contagious cases were carried out, and most of the cases were sent to the division hospital. No typhoid cases were treated in camp, but were sent to hospital.

CONDENSED SICK REPORT FOR JULY.

Mean strength	1,291
Admissions:	
Remaining from last month	44
From command	43
Total	87
Completed cases	47
Returned to duty	47
Died	2
Discharged	10
Transferred to other hospitals	10
Total	69
Remaining on sick report:	
Hospital	27
Quarters	2
Total	29

This regiment left Chickamauga Park, Ga., July 28, and proceeded to Newport News, Va. From the latter place it was transferred to Camp Hamilton, near Lexington, Ky.

The August report is signed by Capt. and Acting Surg. Austin Bell, with the following remarks:

The prevailing diseases for the month of August have been typhoid fever, mumps, and measles. Our typhoid was supposedly

contracted at Chickamauga Park, Ga., probably from a contaminated water supply. All the regiments in the park suffered from this disease to a greater or less extent. The common water supply for the regiments in our brigade was from Crawfish Springs. Each regiment was supplied with a single well. Mumps and measles continued to develop during the month. Rigid daily inspection of the regiment, isolation and guarding of those sick, and detention of suspects greatly reduced the number of new cases.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength	1,079
Admissions:

From command	243
Total	245
Completed cases:	
Returned to duty	28
Died	1
Transferred to other hospitals	166
Total	195
Remaining on sick report:	
Hospital	0
Quarters	48

The September report is signed by Capt. and Acting Surg. Austin Bell, with the following remarks:

Mumps and measles have prevailed during the month. All developed cases were isolated under guard, and all suspects were put in detention. All typhoid cases were removed from camp as quickly as possible. Malaria also prevailed during the month. Our privies were kept in the best possible sanitary condition. Copperas (10 pounds to 10 gallons of water) was used in each sink once a day; 3 pounds of powdered copperas was also used. One bottle of chloride of lime to a bucket of water was used to the sinks three times a day. The floors, seats, and walls of sinks have been scoured and mopped once a day with a solution of bichloride of mercury—1 to 200. All tent floors have been cleaned daily with the same solution.

CONDENSED SICK REPORT FOR SEPTEMBER.

Quarters.....	23
Total	24

The November report is signed by Maj. Austin Bell, who makes the following remarks:

The command remained at Camp Hamilton from November 1 to 11, when the regiment left for Camp Conrad, near Columbus, Ga. The prevailing diseases have been those that are due to exposure to inclement weather, such as coryza, rheumatism, bronchitis, etc. Venereal diseases, syphilis, chancroid, and gonorrhea have been prevalent. We have recommended that all syphilitics be discharged. We have had no typhoid fever during this month. The cases on this report that are diagnosed typhoid fever are all convalescents. There have been no new cases of any contagious disease other than those mentioned above.

CONDENSED SICK REPORT FOR NOVEMBER.

The December report is signed by Major Bell, with the following remarks:

The prevailing diseases have been those that are incident to exposure and damp weather, such as rheumatism, bronchitis, etc. Many cases of influenza have developed during the latter part of the month. The report includes many chronic cases. Discharges have been recommended for most of these. Two cases of measles have developed. These were sent to the brigade hospital, and their clothing has been disinfected. All who have been exposed to these cases had previously had measles.

Quarters.....	38
Total	42

The records concerning the sick in this regiment are so imperfect that it has been impossible for us to obtain exact data. As has been stated, the regiment reached Chickamauga Park, Ga., June 2. On June 6 a case diagnosed intermittent malaria is recorded, and this man remained off duty thirteen days. Possibly this may have been a mild case of typhoid fever. On June 12 a case of intermittent malaria was reported. This man remained in quarters until July 18, when he was sent to Leiter Hospital, and here the disease was diagnosed typhoid fever. We must conclude from this that the Third Kentucky Volunteer Infantry reached Chickamauga Park infected with typhoid fever.

During its stay at Chickamauga Park, or up to July 28, this regiment had 38 probable cases of typhoid fever. Only 6 of these were diagnosed typhoid fever in the regiment. Most of these cases were reported as still sick July 31, but whether they were sick in hospital or in quarters is not stated. Among these 38 cases only 1 death is reported; however, 25 of the 38 cases are left incomplete. It appears from the record that one sick man went with the regiment from Chickamauga to Newport News and there died August 1. After death, this case was diagnosed typhoid fever, the initial date of his illness is given as July 26, two days before the regiment left Chickamauga, but he died at Fort Monroe. Adding this case to the others, we have a record of 39 probable cases of typhoid fever at Chickamauga, with 14 completed cases and 2 deaths.

From August 1 to 19, inclusive, 86 cases of protracted fever were sent to hospitals at Fortress Monroe. We have not been able to find in the records of the Josiah Simpson Hospital any account of these cases. Of these 86 cases, 15 were diagnosed typhoid fever before they were sent to the hospital; 13 are recorded as cases of undetermined fever, and the remainder, 58 in number, are registered as cases of remittent malaria. In addi-

tion to those sent to the hospital at Fortress Monroe between August 1 and 19, 12 cases of protracted fever were furloughed from the regiment. Ten of these were recognized as cases of typhoid fever before they were furloughed. Adding these to the 86 sent to the hospital, it will be found that from August 1 to 19 this regiment furnished 98 cases of protracted fever, 25 of which were recognized by the regimental surgeons as typhoid fever, 13 recorded as cases of undetermined fever, and the remainder as cases of remittent malaria.

From August 19 to 31, inclusive, the regimental records show 22 cases which were of sufficient gravity to be sent to a hospital. They were transferred to the division hospital at Lexington. Eleven of these had a regimental diagnosis of typhoid fever, while the others are registered as cases of malaria.

During the month of September, according to the regimental records, 30 cases of protracted fever were sent to the division hospital. Seven of these were recognized as typhoid fever by the regimental surgeons; 1 is recorded as a case of undetermined fever, and the others, 22 in number, are registered as cases of remittent malaria.

The regimental records in October show only 8 cases sent to division hospital; 1 of these was diagnosed typhoid fever, while the others are registered as cases of remittent malaria.

The regimental records for November show only 6 cases sent to hospital; 1 of these is recorded as a suspected case of typhoid fever, while the others are registered as cases of malaria.

The regimental records for December show 16 cases of protracted fever sent to brigade hospital; 6 of these are registered as undetermined fever, while the others are recorded as cases of remittent malaria.

The following summary will indicate as near as we have been able to determine the number of probable cases of typhoid fever in this regiment:

	Cases.
At Chickamauga Park, from June 2 to July 28	39
Sent to hospital at Fortress Monroe or furloughed, from July 28 to August 19	98
From August 19 to 31	22
During the month of September	30
During the month of October	8
During the month of November	6
During the month of December	16
Total	219

It is altogether probable that this number is smaller than that which would indicate the actual facts. Apparently very few men were furloughed from this regiment.

Contrary to the evidence which we have obtained by

the study of several other regiments, it would seem from the imperfect data at our hand concerning the sickness in the Third Kentucky Volunteer Infantry that this command largely, although not completely, lost its typhoid infection after its second move, or when it went from Newport News, Va., to Lexington, Ky.

SUMMARY.

Assembled at Camp Collier, Lexington, Ky., in May, 1898.

Mustered into United States service May 21, 1898.

Arrived at Chickamauga Park June 2, 1898.

Strength on arrival, 1,213.

Date of first case of probable typhoid fever, June 9, 1898.

Date of first case of recognized typhoid fever, June 21, 1898.

Left Chickamauga Park July 28, 1898.

Strength on departure, 1,293.

Number of cases of probable typhoid fever developed at Chickamauga

39

Arrived at Newport News, Va., about July 30, 1898.

Left Newport News August 19, 1898.

Number of cases of probable typhoid fever developed at Newport News

98

Number of cases of probable typhoid fever developed after leaving Newport News:

From August 19 to 31

22

During September

COMMUNICATIONS FROM THE SURGEONS OF THE THIRD KENTUCKY VOLUNTEER INFANTRY.

Medical officers.

Austin Bell, major and surgeon, Hopkinsville, Ky.

Nevil M. Garrett, captain and assistant surgeon, Frankfort, Ky.

William T. Atkinson, captain and assistant surgeon, Columbus, Ga.

Major Austin Bell states:

Relative to the commencement of the epidemic I desire to state that in my opinion the source of the infection was at Chickamauga Park. I do not think that the regiment was infected on leaving Lexington, for up to June 28 not a single case presented itself with a suspicious fever. Before that date the fever cases were intermittent malaria, typical in type. On June 20 the first suspicious case was seen, followed by another in a very few days. These patients were sent to the First Division Hospital, where subsequently my suspicions were verified by a diagnosis of typhoid fever by the surgeon in charge. From that date to July 4 I did not see any new evidence of the typhoid epidemic, and the fever cases sent to the division hospital were not considered suspicious either by the regimental surgeon or the hospital surgeon. I visited the hospital daily, watching closely for new cases. From July 4 to July 27 I was sick with remittent malaria, as diagnosed by the attending surgeon, in a hospital near Chickamauga, and reported for duty August 2 at Newport News, Va., consequently the cases developing between these dates were known to me only through the regimental records. I saw a fever case carried from Chickamauga to Newport News on the arrival of the regiment at that point, and made the diagnosis of typhoid fever. I was unacquainted with the condition of the case at Chickamauga. While in Virginia our regiment remained in shelter tents for sixteen days without any shade to protect the men from the scorching sun. Much sickness developed, and in most instances the onset was sudden, and an initial chill was very common, followed by a temperature of 104° to 105° F. Often on first seeing the patient an excessively high temperature would be found, with the history of feeling perfectly well until that day. Many of these cases of sudden incipency subsequently proved to be typhoid. Only those cases were diagnosed malaria or typhoid which were undoubtedly these diseases. The undetermined class consisted mostly of suspected typhoid cases. I think many presented a mixed infection, for a preliminary cathartic followed by quinine would occasionally result in a normal or nearly normal temperature, without a subsequent typhoid rise. It appeared that in many instances the typhoids were masked by mild heat prostrations, and a typical typhoid course would follow recovery from that condition. Whatever the cause, certainly the incipency of typhoid fever caused at this point was very atypical. Usually the patients were sent to the Fortress Monroe General Hospital before a certain diagnosis could be determined.

On returning to Lexington, Ky., the number of typhoids became less, and in a short time the epidemic was entirely under control and but an occasional case appeared. An absolutely fresh camp site, purification of all drinking water by filtering and boiling, the removal from camp of all suspicious cases of illness, and a well-constructed closet with an abundance of disinfectants were responsible, I believe, for this change.

For the months of September, October, November, and December the diagnoses made by the regimental surgeon seemed to be disregarded in your report and all cases of continued fever are classed as typhoidal in nature. This is taking much for granted. Until November we were not in a regimental hospital, and our instructions were that all cases requiring special diet or unsuited for treatment in quarters should be sent to division hospital. Acting on these instructions, many cases not of a serious nature were sent to the hospital.

If we treated typical cases of intermittent malaria in camp, why is it not probable that the remittent form would present itself in

the hospital? Furthermore, instructions were given that patients should be returned to the regiment only when capable of performing every duty, and the regimental surgeon was required to visit the hospital daily, in order to see the patients about to be returned. As a result of this, mild cases were often kept in hospital for a long time. During the months of November and December our sickness was nearly all of a mild nature, and I believe the regimental records show the cases as they existed. Those instances in which the diagnoses were not made were sent to the hospital before the attack was developed. The hospital records should give data for these. As a partial excuse for the condition of the regimental records, I wish to state that on reaching Chickamauga Park a surgeon, one assistant surgeon, and two hospital stewards were taken from the regiment, leaving all the work on a green steward and myself. It was impossible for me to look after the camp hygiene, attend to the sick of the regiment, and keep an accurate sick record. The report for the month of July was not made by me. In Lexington, Ky., the medical staff was again reduced and all the work left on me; consequently there are many inaccuracies which would not have existed had a sufficient number of medical officers served continuously with the regiment.

GENERAL REMARKS CONCERNING TYPHOID FEVER IN THE FIRST DIVISION OF THE FIRST ARMY CORPS.

It is quite certain that most if not all of the regiments of this division reached Chickamauga with one or more men infected with typhoid fever. The number of cases of probable typhoid fever developed in this division, with a mean strength of 11,339 officers and men, at Chickamauga Park, may be tabulated as follows:

Brigade and regiment.	Arrived.	Left.	Number of cases.
<i>First Brigade.</i>			
First Kentucky	June 11	July 26	22
Third Wisconsin	May 15	July 5	49
Fifth Illinois	May 17	Aug. 3	47
<i>Second Brigade.</i>			
Fourth Ohio	May 16	July 22	19
Third Illinois	May 17	July 22	60
Fourth Pennsylvania	May 16	July 23	26
<i>Third Brigade.</i>			
Sixteenth Pennsylvania	May 17	July 6	17
Second Wisconsin	May 17	July 6	54
Third Kentucky	June 2	July 28	39

It may possibly be of interest to endeavor to ascertain whether or not the rapidity with which typhoid fever spread among the different regiments was in direct proportion to the number of infected men in the regiment when it reached Chickamauga. We do not suppose that this question can be answered conclusively and positively, but the inquiry may be of some interest. We will compare the Third Illinois with the other regiments of the same brigade. Practically all the regiments of this brigade came to the park and left at the same time. During the fourteen days that remained of May, after the arrival of the Third Illinois, this regiment developed 9 cases of probable typhoid fever. We will suppose that all of these were infected before the regiment reached Chickamauga. Then we may say that this regiment had within itself 9 foci for the distribution of the disease, and from these foci there were developed, up to July 22, 60 cases of probable typhoid

fever. During the fifteen days that remained of the month of May after the arrival of the Fourth Ohio there developed in this regiment 6 cases of probable typhoid fever, and from these 6 foci there developed, up to July 22, 19 cases of probable typhoid fever. During the fifteen days that remained of the month of May after the arrival of the Fourth Pennsylvania there were no cases of typhoid fever in this regiment, and 26 cases developed by July 23. We have carried out this line of inquiry in several brigades, and have reached the general conclusion suggested by the above-given figures, i. e., there is no constant relation between the number of men infected with typhoid fever in a regiment at the time of its going into a camp and the number that developed the disease outside of those previously infected within a given time. The explanation for this is not difficult to find. The means for the spread of the infection must vary in every command.

There is one point in connection with the camp of the Second Brigade of the First Division at Chickamauga which may be worthy of consideration. From April 22 to 30, 1898, the Sixteenth United States Infantry was encamped in Chickamauga Park. At this encampment at this place this regiment reported no sickness, but soon after it reached Tampa in May, 1898, it reported 13 cases of acute intestinal catarrh, 3 cases of diarrhea, and 3 cases of typhoid fever. When the Second Brigade of the First Division of the First Army Corps was located in Chickamauga Park, the regimental camp of the Third Illinois occupied a part of the site recently vacated by the Sixteenth United States Infantry, while the other regiments of this brigade were placed some distance away. It is possible that the Sixteenth United States Infantry might have infected the ground subsequently occupied by the Third Illinois. As an isolated instance this fact can have no great sig-

nificance, but we have found numerous similar instances, and we are strongly of the opinion that only in case of the most urgent military necessity should any command be placed on a site recently vacated by another.

It must be evident from the histories of the regiments of this division that military organizations after becoming widely infected with typhoid fever do not lose this infection on changing locality of camp, even when all the sick are left behind and the site to which the command removes is free from infection. The infection is carried in the bodies of the men, in their clothing, bedding, and tentage. Thorough disinfection of everything, in addition to change of location, is necessary in order to stamp out typhoid fever after it has become widely distributed in a command.

We have not been able to obtain the records of the hospital of this division.

Summary of deaths in the First Division of the First Army Corps.

Brigade and regiment.	Total deaths.	Deaths due to typhoid fever.

General remarks concerning typhoid fever in the Second Division of the First Army Corps	106

THIRTY-FIRST MICHIGAN VOLUNTEER INFANTRY.

First Brigade, Second Division, First Army Corps.

This regiment assembled at Island Lake, Mich., in the latter part of April, 1898. It reached Chickamauga Park, Ga., May 17, 1898. The first report covers the dates from May 17 to 31, inclusive.

In this report, Maj. Andrew Biddle, in charge, makes the following statement:

There have been, and still are, many cases of congestive diarrhea, due to the combined influence of change of troops from Michigan to this climate, extreme heat—possibly injudicious feeding; all drinking water has been boiled. Otherwise the command has been in good health, standing the campaign well. No contagious disease exists. The policing of the camp is excellent.

CONDENSED SICK REPORT FROM MAY 17 TO 31, INCLUSIVE.

Mean strength	1,019
Diarrhea	4
Intestinal toxæmia	1
Malaria	1
Other diseases	18
Total	24

It is evident, from the remarks of Major Biddle, that all cases of diarrhea have not been recorded in the sick report.

In the June report, Capt. Frank K. Owens, in charge, makes the following statement:

There have been, and still are, many cases of congestive diarrhea, due to climatic changes, change of water, and at present partly due to the large amount of food shipped to the soldiers from Michigan; otherwise the command has been in excellent health, standing the campaign well. During the month the entire regiment was vaccinated, about 70 per cent of the vaccinations

being satisfactory; no serious illness has resulted from this operation. No contagious disease exists.

The policing and general sanitary condition of the camp are excellent.

CONDENSED SICK REPORT FOR JUNE.

Mean strength	1,315
Diarrhea	17
Remittent fever	1
Enteritis	1
Typhoid fever	1
Other diseases	36
Total	56

The recognized typhoid-fever case was that of a private in Company C, and the initial date is given as June 1. It will thus be seen that this case of typhoid fever appeared within the period of incubation after leaving Island Lake. It is therefore probable that this regiment went to Chickamauga infected with typhoid fever. All cases of diarrhea in this report were of short duration. The case of remittent fever continued for only three days.

The sick report for the month of July is signed by Captain Owens without comment.

CONDENSED SICK REPORT FOR JULY.

Mean strength	1,303
Diarrhea	14
Remittent malaria	13
Intermittent malaria	16
Typhoid fever	10
Enteritis	1
Other diseases	53
Total	107

Of the recognized cases of typhoid fever, 1 was brought over from the June report, leaving 9 cases developed in the month of July. Of the 10 cases of typhoid fever up to the close of this report, 2 died during July. There was 1 other death in the regiment during the month of July. This was a private in Company F, whose name first appears on sick report June 26. His disease was diagnosed as acute indigestion, and he died July 17. Undoubtedly this also was a case of typhoid fever. There are many other probable cases of typhoid fever in this report. These cases will be given in the list appended later.

This regiment left Chickamauga for Knoxville, Tenn., August 21.

The August report is signed by Captain Owens without comment.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength.....	1, 167
Intermittent malaria.....	15
Remittent malaria.....	22
Malaria.....	25
Diarrhea.....	20
Typhoid fever.....	18
Indigestion.....	8
Enteritis.....	2
Undetermined fever.....	1
Dysentery.....	1
Other diseases.....	21
Total.....	133

Of the 18 cases of typhoid fever registered in this report, 11 developed in the month of August.

The September report is signed by Captain Owens without comment.

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength.....	1, 068
Malaria.....	63
Intermittent malaria.....	9
Remittent malaria.....	37
Diarrhea.....	6
Typhoid fever.....	30
Gastritis.....	1
Enteritis.....	2
Other diseases.....	25
Total.....	173

The October report is signed by Captain Owens without comment.

CONDENSED SICK REPORT FOR OCTOBER.

Mean strength.....	931
Malaria.....	66
Remittent malaria.....	28
Intermittent malaria.....	6
Diarrhea.....	4
Typhoid fever.....	44
Dysentery.....	1
Enteritis.....	2
Other diseases.....	33
Total.....	184

Of the 44 cases of recognized typhoid fever in this report, 24 originated in October.

The following is a list of the recognized and probable cases of typhoid fever in this regiment:

A.—At Chickamauga.

- No. 1. Company C: Typhoid fever, June 1 to July 27.
- No. 2. Company F: Indigestion, June 26; died July 17.
- No. 3. Company E: Malaria, June 31 to July 28.
- No. 4. Company A: Malaria, July 6 to 26.
- No. 5. Company G: Malaria, July 6; furloughed September 18.
- No. 6. Company F: Malaria, July 8 to 26.
- No. 7. Company F: Malaria, July 9; still sick August 20. There is no further record of this case.
- No. 8. Company M: Typhoid fever, July 11; died July 13.
- No. 9. Company M: Malaria, July 11 to 23.
- No. 10. Company F: Typhoid fever, July 11; sent to Leiter Hospital July 14.
- No. 11. Company L: Malaria, July 11; sent to division hospital July 22.
- No. 12. Company L: Malaria, July 13 to August 2.
- No. 13. Company K: Malaria, July 14 to August 30.
- No. 14. Company C: Malaria, July 14 to September 17.
- No. 15. Company G: Malaria, July 14; sent to division hospital July 31.
- No. 16. Company C: Typhoid fever, July 14; furloughed August 16. In the division hospital this case was diagnosed as continued fever.
- No. 17. Company A: Malaria, July 14 to August 29.
- No. 18. Staff: Typhoid fever, July 15 to August 29.
- No. 19. Company H: Malaria, July 16 to November 26.
- No. 20. Company F: Malaria, July 16 to August 19.
- No. 21. Company F: Malaria, July 16; furloughed August 31.
- No. 22. Company D: Malaria, July 17; sent to hospital August 24.
- No. 23. Company D: Malaria, July 17 to August 27.
- No. 24. Company I: Malaria, July 17; furloughed November 20. At the division hospital this case was diagnosed typhoid fever.
- No. 25. Company D: Malaria, July 17; still sick August 31. There is no further record of this man.
- No. 26. Company I: Malaria, July 18 to August 12.
- No. 27. Company E: Malaria, July 18; sent to division hospital August 24.
- No. 28. Company E: Malaria, July 18 to August 6.
- No. 29. Company F: Malaria, July 19; sent to Fort Myer November 24. At the division hospital this case was diagnosed as typhoid fever.
- No. 30. Company I: Malaria, July 19 to August 10.
- No. 31. Company M: Malaria, July 20; furloughed August 31.
- No. 32. Company L: Malaria, July 20 to August 21.
- No. 33. Company I: Malaria, July 21 to August 6.
- No. 34. Company A: Malaria, July 21; furloughed September 14.
- No. 35. Company G: Malaria, July 23 to August 22.
- No. 36. Company H: Malaria, July 24; sent to division hospital August 31.
- No. 37. Company L: Typhoid fever, July 27 to October 19.
- No. 38. Company H: Malaria, July 27 to August 11.
- No. 39. Company B: Malaria, July 27; sent to division hospital August 31.
- No. 40. Company A: Typhoid fever, July 27; disposition not given.
- No. 41. Company D: Typhoid fever, July 27; died July 28.
- No. 42. Company G: Malaria, July 27; furloughed September 14.
- No. 43. Company G: Typhoid fever, July 28; furloughed August 18.
- No. 44. Company G: Malaria, July 28 to August 17.
- No. 45. Company I: Typhoid fever, July 28; disposition not given.

- No. 46. Company G: Malaria, July 29 to September 30.
 No. 47. Company D: Malaria, July 29 to October 21.
 No. 48. Company K: Typhoid fever, July 30; furloughed September 14.
 No. 49. Company C: Malaria, July 31; furloughed August 8.
 No. 50. Company C: Malaria, July 31 to August 18.
 No. 51. Company G: Malaria, July 31; sent to division hospital August 31.
 No. 52. Company C: Typhoid fever, August 1; furloughed September 14.
 No. 53. Company C: Malaria, August 1 to 27.
 No. 54. Company D: Typhoid fever, August 2 to October 19.
 No. 55. Company K: Malaria, August 3; furloughed September 14.
 No. 56. Company D: Malaria, August 3; furloughed August 24.
 No. 57. Company B: Malaria, August 3; furloughed August 19.
 No. 58. Company G: Malaria, August 4 to September 4.
 No. 59. Company M: Malaria, August 5 to October 19.
 No. 60. Company A: Malaria, August 5; sent to division hospital August 14. There is no further record of this case.
 No. 61. Company G: Malaria, August 5; furloughed August 31.
 No. 62. Company G: Typhoid fever, August 6; furloughed September 14.
 No. 63. Company I: Malaria, August 6 to September 1.
 No. 64. Company D: Malaria, August 7; furloughed August 19.
 No. 65. Company D: Malaria, August 7 to 29.
 No. 66. Company F: Malaria, August 8; sent to division hospital August 31.
 No. 67. Company M: Typhoid fever, August 8; sent to division hospital August 31.
 No. 68. Company M: Typhoid fever, August 8 to October 14.
 No. 69. Company B: Malaria, August 8 to October 5.
 No. 70. Company F: Malaria, August 9; furloughed September 14.
 No. 71. Company B: Malaria, August 9 to September 10.
 No. 72. Company M: Malaria, August 10 to October 2.
 No. 73. Company H: Malaria, August 11; sent to division hospital September 1.
 No. 74. Company A: Malaria, August 12; furloughed November 10.
 No. 75. Company M: Malaria, August 12; furloughed September 14.
 No. 76. Company K: Malaria, August 13 to September 13.
 No. 77. Company A: Malaria, August 13 to September 14.
 No. 78. Company H: Malaria, August 13; sent to division hospital August 31.
 No. 79. Company K: Malaria, August 14; furloughed August 25.
 No. 80. Company B: Malaria, August 14 to 31.
 No. 81. Company L: Malaria, August 15; furloughed September 14. At the division hospital this case was diagnosed typhoid fever.
 No. 82. Company E: Typhoid fever, August 15; furloughed September 14.
 No. 83. Company A: Malaria, August 15; sent to division hospital August 31.
 No. 84. Company B: Malaria, August 15 to October 14.
 No. 85. Company L: Malaria, August 15 to September 1.
 No. 86. Company L: Malaria, August 16; sent to division hospital August 31.
 No. 87. Company H: Malaria, August 16 to September 1.
 No. 88. Company H: Typhoid fever, August 16; furloughed September 10.
 No. 89. Company E: Malaria, August 17 to October 27.
 No. 90. Company E: Malaria, August 17 to September 5.
 No. 91. Company A: Malaria, August 18 to September 5.
 No. 92. Company D: Malaria, August 19 to October 6.
 No. 93. Company C: Malaria, August 19 to October 6.
 No. 94. Company A: Malaria, August 19; sent to division hospital August 31.
 No. 95. Company G: Malaria, August 19; furloughed September 14.

B.—At Knoxville.

- No. 96. Company D: Typhoid fever, August 22 to October 21.
 No. 97. Company A: Malaria, August 22 to October 10.
 No. 98. Company I: Malaria, August 22; furloughed September 14.
 No. 99. Company B: Malaria, August 22; furloughed September 14.
 No. 100. Company E: Malaria, August 23; furloughed September 14.
 No. 101. Company M: Malaria, August 23 to October 24.
 No. 102. Company E: Typhoid fever, August 24; furloughed September 14.
 No. 103. Company A: Malaria, August 24; furloughed September 14.
 No. 104. Company D: Malaria, August 24; furloughed September 14.
 No. 105. Company B: Malaria, August 25 to September 17.
 No. 106. Company C: Malaria, August 25; furloughed September 14.
 No. 107. Company C: Malaria, August 25 to September 15.
 No. 108. Company C: Malaria, August 26; furloughed September 14, and this furlough was extended.
 No. 109. Company E: Malaria, August 27; furloughed September 14, and this furlough was extended.
 No. 110. Staff: Typhoid fever, August 27; died September 9.
 No. 111. Company H: Malaria, August 28; furloughed September 14, and this furlough was extended.
 No. 112. Company L: Typhoid fever, August 28; furloughed September 14, and this furlough was extended.
 No. 113. Company H: Malaria, August 18; furloughed September 14, and this furlough was extended. In the division hospital this case was diagnosed as typhoid fever.
 No. 114. Band: Typhoid fever, August 28; furloughed September 14, and this furlough was extended.
 No. 115. Company D: Malaria, August 29; furloughed September 14, and this furlough was extended.
 No. 116. Company L: Malaria, August 29; furloughed September 14, and this furlough was extended. In the division hospital this case was diagnosed as typhoid fever.
 No. 117. Company K: Malaria, August 30; furloughed September 14.
 No. 118. Company F: Typhoid fever, August 30; furloughed September 14.
 No. 119. Company K: Malaria, August 31; furloughed September 14. This man returned to his regiment convalescent from typhoid fever and was again furloughed.
 No. 120. Company H: Malaria, August 31; still sick September 30.
 No. 121. Company K: Malaria, August 31; furloughed September 14.
 No. 122. Company E: Malaria, September 1; furloughed September 14, and this furlough was extended. At his home this case was diagnosed typhoid fever.
 No. 123. Company I: Malaria, September 3; furloughed September 14, and this furlough was extended.
 No. 124. Company M: Malaria, September 3 to October 14.
 No. 125. Company B: Malaria, September 3; died September 9.
 No. 126. Company F: Malaria, September 4; furloughed September 14, and this furlough was extended.
 No. 127. Company D: Malaria, September 5; furloughed September 14, and this furlough was extended.
 No. 128. Company B: Malaria, September 5; furloughed September 14, and this furlough was extended.
 No. 129. Company M: Typhoid fever, September 5; furloughed September 14.

No. 130. Company M: Typhoid fever, September 5; furloughed September 14.

No. 131. Company M: Malaria, September 5 to October 7.

No. 132. Company G: Malaria, September 6; not returned to duty October 31.

No. 133. Company L: Malaria, September 6 to October 5.

No. 134. Company E: Malaria, September 7 to October 23.

No. 135. Company G: Typhoid fever, September 8; furloughed September 14.

No. 136. Company A: Malaria, September 8; furloughed September 14. This furlough was extended, and the man was discharged October 8.

No. 137. Company D: Malaria, September 9; furloughed September 14, and this furlough was extended.

No. 138. Company I: Typhoid fever, September 9; furloughed October 7.

No. 139. Company A: Malaria, September 9; discharged October 12.

No. 140. Company D: Malaria, September 10; sent to division hospital September 30.

No. 141. Company E: Malaria, September 11; furloughed September 14, and this furlough was extended.

No. 142. Company E: Malaria, September 11; furloughed September 14, and this furlough was extended.

No. 143. Company I: Malaria, September 11 to 28.

No. 144. Company D: Malaria, September 11; furloughed October 24. This man was returned to duty October 9 and sent back to the hospital October 12, from which he was furloughed October 28.

No. 145. Company F: Typhoid fever, September 12; furloughed September 27.

No. 146. Company D: Typhoid fever, September 13; sent to division hospital September 30.

No. 147. Company D: Typhoid fever, September 13; furloughed October 12.

No. 148. Company I: Malaria, September 14 to October 8.

No. 149. Company F: Malaria, September 14 to October 4.

No. 150. Company E: Malaria, September 14 to October 4.

No. 151. Company G: Malaria, September 14 to October 8.

No. 152. Company B: Typhoid fever, September 15; furloughed October 15.

No. 153. Company M: Malaria, September 15 to October 9.

No. 154. Company E: Malaria, September 15; furloughed October 4.

No. 155. Company C: Malaria, September 15 to October 3.

No. 156. Company L: Malaria, September 15; discharged October 6.

No. 157. Company F: Malaria, September 15 to October 18.

No. 158. Company I: Malaria, September 16 to October 10.

No. 159. Company I: Malaria, September 16 to October 10.

No. 160. Company L: Malaria, September 16 to October 10.

No. 161. Company H: Malaria, September 16; still sick October 31.

No. 162. Company L: Malaria, September 16; sent to division hospital September 23. Here the disease was diagnosed as typhoid fever.

No. 163. Company E: Malaria, September 18; furloughed October 2.

No. 164. Company D: Typhoid fever, September 18; sent to division hospital September 26.

No. 165. Company A: Malaria, September 19 to October 8.

No. 166. Company K: Malaria, September 19 to October 8.

No. 167. Company K: Malaria, September 19 to October 10.

No. 168. Company B: Malaria, September 20 to October 18.

No. 169. Company F: Typhoid fever, September 20; furloughed November 18.

No. 170. Company C: Typhoid fever, September 21; furloughed October 24.

No. 171. Company F: Malaria, September 21; furloughed November 8. At the division hospital this case was diagnosed typhoid fever.

No. 172. Company M: Typhoid fever, September 22; furloughed October 5.

No. 173. Company F: Typhoid fever, September 22; furloughed October 19.

No. 174. Company I: Malaria, September 22; furloughed October 30.

No. 175. Company I: Malaria, September 24; furloughed November 30. At the division hospital this case was diagnosed typhoid fever.

No. 176. Company B: Malaria, September 24; still sick November 30.

No. 177. Company E: Malaria, September 24 to October 10.

No. 178. Company K: Malaria, September 25 to October 16.

No. 179. Company I: Malaria, September 25 to October 18.

No. 180. Company L: Malaria, September 25; furloughed October 6.

No. 181. Company M: Typhoid fever, September 26; furloughed October 27.

No. 182. Company K: Malaria, September 27 to October 24.

No. 183. Company M: Malaria, September 28; still sick November 30.

No. 184. Company L: Typhoid fever, September 29; sent to division hospital October 19.

No. 185. Company I: Typhoid fever, September 29; sick in quarters November 6.

No. 186. Company C: Malaria, September 29; sick in hospital October 31.

No. 187. Company I: Typhoid fever, September 29; disposition not given.

No. 188. Band: Malaria, September 30; sick in hospital October 31.

No. 189. Company D: Typhoid fever, October 1; sent to division hospital October 16.

No. 190. Company I: Malaria, October 2 to 31.

No. 191. Company D: Malaria, October 2 to 22.

No. 192. Company I: Malaria, October 3 to 26.

No. 193. Company D: Malaria, October 4; died at Knoxville, Tenn.; the date of death is not given.

No. 194. Company B: Malaria, October 5; furloughed October 19.

No. 195. Company K: Typhoid fever, October 7; sick in hospital October 31.

No. 196. Company D: Malaria, October 7; still sick November 30.

No. 197. Company H: Typhoid fever, October 7; furloughed October 28.

No. 198. Company I: Malaria, October 7; still sick October 31.

No. 199. Company A: Malaria, October 8; still sick November 30.

No. 200. Company I: Typhoid fever, October 8; furloughed November 1.

No. 201. Company F: Typhoid fever, October 9; sent to division hospital October 11.

No. 202. Company A: Malaria, October 9; furloughed October 21.

No. 203. Company F: Typhoid fever, October 9; sent to division hospital October 11.

No. 204. Company L: Typhoid fever, October 10; furloughed November 4.

No. 205. Company M: Typhoid fever, October 12; sick in hospital October 31.

No. 206. Company D: Typhoid fever, October 12; furloughed November 4.

No. 207. Company I: Typhoid fever, October 13; furloughed November 11.

No. 208. Company I: Typhoid fever, October 13; furloughed October 29.

No. 209. Company D: Typhoid fever, October 14; disposition not given.

No. 210. Staff: Malaria, October 16; still sick November 30.

No. 211. Company M: Typhoid fever, October 16; furloughed November 18.

No. 212. Company B: Typhoid fever, October 16; sent to division hospital October 27.

No. 213. Company H: Typhoid fever, October 18; furloughed November 15.

No. 214. Company D: Typhoid fever, October 19; sent to division hospital October 23.

No. 215. Company H: Typhoid fever, October 20; sent to division hospital October 26.

No. 216. Company E: Typhoid fever, October 20; furloughed November 20.

No. 217. Company H: Typhoid fever, October 21; sent to Fort Myer, November 2.

No. 218. Company I: Typhoid fever, October 23; furloughed November 21.

No. 219. Company D: Typhoid fever, October 25; disposition not given.

No. 220. Company I: Typhoid fever, October 26; sent to division hospital October 31.

No. 221. Company C: Typhoid fever, October 28; died November 11.

No. 222. Company E: Typhoid fever, October 30; sent to division hospital October 31.

The above list includes all probable cases of typhoid fever found on the regimental records from May 17 to October 31, inclusive. In addition to the above, we have found in the division hospital records of the following cases:

No. 223. Company F: Sent to division hospital October 11, with typhoid fever, and furloughed November 21.

No. 224. Company D: Sent to division hospital October 22, with gastro-enteritis, and furloughed November 18.

No. 225. Company A: Sent to division hospital August 2, with remittent malaria, and furloughed September 24.

No. 226. Company H: Sent to division hospital August 18, with remittent malaria, and furloughed August 24.

No. 227. Company D: Sent to division hospital September 24, with typhoid fever, and furloughed October 28.

No. 228. Company not given; sent to division hospital November 19, with typhoid fever.

No. 229. Company L: Sent to division hospital October 13, with remittent malaria, and furloughed October 24.

No. 230. Company I: Sent to division hospital September 2, with remittent malaria, and furloughed September 14.

No. 231. Company A: Sent to division hospital October 26, with typhoid fever and furloughed November 20.

No. 232. Company B: Sent to division hospital November 9, with typhoid fever, and furloughed November 23.

No. 233. Company B: Sent to Sternberg Hospital August 30, with continued malarial fever, and furloughed without date.

No. 234. Company D: Sent to division hospital August 8, with typhoid fever, and furloughed August 18.

No. 235. Company I: Sent to division hospital October 27, with typhoid fever, and furloughed November 21.

No. 236. Company M: Sent to division hospital November 10, with typhoid fever, and sent to Fort Myer November 20.

No. 237. Company C: Sent to division hospital October 19, with typhoid fever, and furloughed November 21.

No. 238. Company G: Sent to division hospital November 24, with typhoid fever.

No. 239. Company L: Sent to division hospital September 23, with typhoid fever; died October 4.

SUMMARY.

Assembled at Camp Eaton, Island Lake, Mich., in April, 1898.

Mustered into United States service May 8, 1898.

Arrived at Chickamauga Park May 17, 1898.

Strength on arrival, 1,019.

Date of first case of probable typhoid fever, June 1, 1898.

Date of first case of recognized typhoid fever, June 1, 1898.

Left Chickamauga Park August 21, 1898.

Strength on departure, 1,290.

Number of cases of probable typhoid fever developed at Chickamauga..... 95

Reached Knoxville, Tenn., August 22, 1898.

Number of cases of probable typhoid fever developed at Knoxville:

From August 22 to 31.....	26
During September.....	67
During October.....	51

Total number of cases of probable typhoid fever developed in this regiment from May to October..... 239

These 239 cases were diagnosed as follows:

Typhoid fever.....	86
Malaria.....	151
Gastro-enteritis.....	1
Indigestion.....	1
Total.....	239

This regiment remained in service until April, 1899, but we have not carried the study of its records beyond the October report.

When this regiment first reached Chickamauga Park it obtained its drinking water from a well, known as Jay's mill well. Just how long the use of water from this source continued we do not know, but it soon became evident that this well, if not already contaminated, would be likely to become so. The water was brought in barrels from springs outside the park, principally from Georgia Mineral Springs. There were some bored wells about the camp, and water from these was used also for a short time, but was discontinued on the suspicion that the water in them might become infected. We have endeavored to ascertain the exact date when this and other regiments of this division discontinued the well water and began to get their water supply from the springs.

Major Hysel, surgeon of this division, made a statement which may be condensed as follows:

I reached Chickamauga Park June 7, 1898. Some time during the last week of June I went to the camp of the Thirty-first Michigan Volunteer Infantry and found in the regimental hospital of that command two cases of typhoid fever. I began an investigation to find if possible the source of the infection in these cases. The colonel of the regiment told me that he believed the disease was due to impure water obtained from Jay's mill well. I immediately went to examine this well, and after seeing it I, too,

was convinced that the water in it might be contaminated. I had been led to believe that all the wells in the park were artesian, but this one certainly is not. It is a dug well, walled up with rock, and its location is such that it received the drainage from a brigade and from the corrals of the various regiments. The natural surface drainage from these sites converged at the well. I had the pump pulled out and ordered that the use of this water be discontinued. From this time on there was more or less typhoid fever in the Thirty-first Michigan Volunteer Infantry.

From this testimony it seems that the Thirty-first Michigan Volunteer Infantry continued to use water from Jay's mill well through the latter half of May and during the first three weeks of June. By reference to the list of cases of probable typhoid fever it will be seen that the first case in this regiment had its initial date June 1, 1898. It is probable that the infection in this case occurred before the regiment arrived at the park. Moreover, it is not probable that the water of this well was infected when the troops arrived. Up to that time there was nothing about the well likely to infect its contents. There were but few people in the park, and the workmen generally employed in making roads had used the water from this and other wells continuously for years, and General Boynton assured us that none of these workmen had ever developed typhoid fever. We think it highly improbable that the first case of typhoid fever in this regiment received its infection from this well. The hospital for this division was not established until June 14, and up to this time the sick in all the regiments were kept in regimental hospitals, and in the Thirty-first Michigan and the First Georgia, which came on the ground with typhoid fever June 17, the sick continued in the regimental hospitals. The regiments near Jay's mill well up to the last of June were the following: First West Virginia, Sixth Ohio, One hundred and fifty-eighth Indiana, One hundred and sixtieth Indiana, Thirty-first Michigan, and First Georgia. All of these commands, with the exception of the One hundred and sixtieth Indiana, had during this time one or more cases of typhoid fever. The probabilities are that if Jay's mill well was infected it received the infection from the troops. What are the probabilities that this did happen? In attempting to answer this question we will confine ourselves to the records of the Thirty-first Michigan. From July 6, 1898, typhoid fever became epidemic in this regiment, and 47 cases developed during the month of July. From this we can only say that it seems quite probable that the infection from this and the other regiments of the First and Second Brigades of the Second Division of the First Army Corps was returned to the troops of this and other regiments through the water of this well.

The testimony of Lieutenant-Colonel Shubel, of the Thirty-first Michigan, agrees quite accurately with that

of Major Hysel. Colonel Shubel informed us that the regiment continued to use the water from this well for six weeks after it arrived at the park.

The chance of pollution of the water from a well that received the drainage of this camp is shown by the testimony of Colonel Shubel concerning the sinks. He said:

We had great trouble while on this site in digging our sinks and we wrecked many shovels and picks in our attempts to dig them, and the results attained were not satisfactory.

This Jay's mill well was in a kind of swale in the road and all the overflow from the sinks above went around this well, and only the pump protruded above the water which had collected from the more elevated camp sites.

Captain Smith, of the Thirty-first Michigan, testified:

From my experience as officer of the day I can say that the water would sometimes get so deep around this well that one could see only the top of the pump. I have seen the water standing 3 feet deep for some distance around this well.

With the conditions as here described, it would hardly seem possible that the water of this well could escape infection with the specific germ of typhoid fever.

After the discontinuance of the well water, this regiment, as has been stated, hauled water in barrels from springs. Colonel Shubel stated that all the water brought from the springs was boiled, placed in barrels, which were surrounded with sawdust, and iced. Moreover, about the last of July or the 1st of August, the date can not be fixed exactly, this regiment was moved to another site quite distant from any other regiment. On August 21, this command was moved to Knoxville, Tenn. At this place it had an ideal camp site—plenty of most excellent water, and the soil permitted the construction of proper sinks. Notwithstanding these changes, typhoid fever continued quite unabated throughout August and September and was still epidemic throughout October.

At no time did this regiment have access to the water of Chickamauga Creek, which was piped through the other divisions of the First and Third Army Corps.

At the time of our inspection this regiment was under the care of a contract surgeon and the regimental hospital was not in good condition. For instance, there were four soiled bedpans not more than 10 feet from the ward, and these pans had not been cleaned and were filled with swarms of flies. Copperas only was used as a disinfectant.

We are quite confident that our list of cases of probable typhoid fever for this regiment is too small. The day before we inspected this command, 79 men had been sent home sick. Colonel Shubel reported to us 10 deaths up to that time (September 15, 1898). "Two officers had died from typhoid fever and at least a dozen had been sick with the disease." Our list contains the names of only three officers, two of whom died.

The following is an alphabetical list of total deaths in this regiment, so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Austin, Earl Y.....	Pvt., G.	1899. Jan. 22	Sunfield, Mich.....	Typhoid.
Bond, Franklin	Pvt., M.	1898. Aug. 3	Do.
Bartrem, Chas. E.....	Pvt., B.	Aug. 9	Chickamauga, Ga.....	Cerebro-spinal meningitis.
Boynton,	Nov. 3	Knoxville, Tenn.....	Purpura hæmorrhagica.
Burns, Wm. C	Pvt., I.	Aug. —	Typhoid.
Davis, Frank W	Pvt., M.	1899. Jan. 4	Knoxville, Tenn.....	Pneumonia.
Gray, Benj. H	Pvt., E.	Mar. 2	Typhoid.
Fletcher, George W.....	Pvt., B.	Jan. 17	Camp Poland, Tenn.....	Pneumonia.
Fox, John W	Pvt., M.	1898. Dec. 30	Knoxville, Tenn.....	Typhoid.
Gray, Marvin	Band.	Aug. 16	Chattanooga, Tenn.....	Dysentery.
Gould, Henry.....	Sept. 2	On train	Heart failure?
Grimes, Adelbert D.....	Pvt., F.	July 17	Camp Thomas, Ga.....	Typhoid.
Gutmann, John M.....	Capt., M.	July 13	Chattanooga, Tenn.....	Do.
Hawn, Rediford	Pvt., F.	Aug. —	Do.
Keegan, Daniel	Pvt., M.	Dec. 12	Camp Poland, Tenn.....	Pneumonia.
Meginnis, Henry H.....	Pvt., F.	May 24	Chickamauga, Ga.....	Do.
Nash, Homer O.....	Staff.	Sept. —	Typhoid.
Palmer, Homer O.....	Pvt., C.	Sept. 15	Regimental hospital.....	Do.
Pridil, William.....	Pvt., L.	Sept. 16	Chickamauga, Ga.....	Do.
Saunders, Henry D.....	Pvt., L.	July 22	Regimental hospital.....	Inflammation of bowels.
Sullivan, James A.....	Pvt., C.	Nov. 11	Camp Poland, Tenn.....	Typhoid.
Taylor, Hollis P	Pvt., C.	Sept. 15	Knoxville, Tenn.....	Typhoid and abscess of liver.
Tuttle, Guy.....	Corpl., G.	July 27	Camp Thomas, Ga.....	Enteric fever.
Von Waldenhausen, Fred.....	Pvt., A.	Sept. —	Typhoid.
Waylett, Ernest E.....	Pvt., L.	Oct. 4	Camp Poland, Tenn.....	Typhoid.
Weldon, Norman E.....	Pvt., L.	Oct. 6	Knoxville, Tenn.....	Complication of diseases.
Wilcox, Lavergue H.....	Pvt., B.	Sept. 9do	Dysentery.
Total deaths.....				27
Deaths due to typhoid fever.....				16
Percentage of deaths among probable cases of typhoid fever (239), 6.69.				
Percentage of deaths among recognized cases of typhoid fever (86), 18.60.				

COMMUNICATIONS FROM THE SURGEONS OF THE THIRTY-FIRST MICHIGAN VOLUNTEER INFANTRY.

Medical officers.

Charles D. W. Colby, major and surgeon, Jackson, Mich.
 Frank K. Owen, captain and assistant surgeon, Ypsilanti, Mich.
 Allen D. McLean, lieutenant and assistant surgeon, Detroit, Mich.

Major Colby makes the following statement:

The first camp of the Thirty-first Michigan at Chickamauga was on an elevation between two swales, which came together at the culvert near Jay's Mill. The swale back of headquarters drained the camp of the One hundred and sixtieth Indiana. The other, which ran between the end of company streets and company kitchens, drained division hospital camp and two corrals. After rains both of these swales would run full, and it was the coming together of these two streams which flooded the well and covered the pump at Jay's Mill. I have seen the company kitchen fires extinguished by this stream. The band was on the right of the regiment, and still farther to the right and near the swale was a slop sink, used by the band and one company (all the waste which could possibly be made to burn was put on fires after each meal, the fluid slops only being thrown in such sinks). The nature of the soil was such that the liquid was very slow in settling away, and on many occasions before filling the sink it had to be partly filled with brush to hold the dirt up and prevent liquid rising above the dirt as it was thrown in. I have seen these sinks filled and overflowing with the rain water as it

ran down the swale, causing such a stench that it drove the cooks out of the kitchens. The line of company kitchens stood at a slight angle to the road from Lytle to Jay's Mill, bringing the kitchen of the company on the left within 2 rods of the road, which between rains was exceedingly dusty. There was always a little water in the swale back of headquarters, and after a rain it would overflow its banks. When we arrived a number of the men obtained their drinking water by digging into the crevices between the rocks. This was soon condemned. The holes were enlarged, boxes sunk into them, and the water was used for washing purposes only. Soon after this we began hauling water from the big springs on the Ringold road (not the Georgia Mineral Spring). About the middle of June I was detailed for duty with the Reserve Ambulance Corps, First Army Corps, and from that time until November 3, when I was again on duty with the regiment, I know little of its history, except by hearsay. About December 1 our regimental hospital at Camp Poland was closed, because some one reported to Lieutenant-Colonel Wilcox, chief surgeon, on staff of Major-General Wilson, that we had 22 cases of typhoid fever. After being closed for nearly two weeks and after an investigation, which showed that we had no typhoid, was made, we were allowed to open it again. I always sent every suspicious case at once to division hospital.

Just as we were leaving for Cuba measles broke out in our camp, both at Knoxville and Savannah, and the disease went through the command quite generally, although most of the cases were mild. While at Knoxville we treated 18 or 20 cases of pneumonia in the regimental hospital, with 2 deaths. Colonel Gardner had a severe attack, and we cared for him at a hotel.

Upon our arrival at Cienfuegos all our sick were sent to the Sixth Ohio hospital, and, as soon as convalescent, forwarded to join the regiment at Amaro. Soon after arriving at Amaro we had a large number of cases of dengue, the patients returning to duty in from five to seven days after first chill.

The sanitary arrangements of our camp at Amaro were such that, when inspected by Colonel Greenleaf, he remarked: "This is certainly a beautiful camp; I have no fault to find and no suggestions to offer." Gonorrhea, and its complications, was always with us. One morning at sick call at Knoxville 24 men from one company came up with it. This is just a sample. Captain McLean, when asked by a friend what his duties were, replied that he was "genito-urinary surgeon" to the Thirty-first Michigan.

Of the hospital and sanitary arrangements on board transports and at Dafuskie Island, the less said the better.

ONE HUNDRED AND SIXTIETH INDIANA VOLUNTEER INFANTRY.

First Brigade, Second Division, First Army Corps.

This regiment reached Chickamauga Park, Ga., May 17, 1898.

The first report is signed by Assistant Surgeon Buehler, who makes the following statement:

There have been a great number of cases of diarrhea in the command, due to climatic changes and to the eating of strawberries. There has been one case of measles.

CONDENSED SICK REPORT FROM MAY 18 TO MAY 31, INCLUSIVE.

Mean strength	1,023
Diarrhea.....	1
Dysentery	2
Enteritis.....	2
Other diseases.....	16
Total	21

Evidently the great number of cases of diarrhea in the command referred to by the surgeon was not entered upon the sick report.

In the June report the assistant surgeon makes the following statement:

Diarrhea is still prevalent, but is on the decrease. Three cases of measles have appeared, but have been quarantined.

CONDENSED SICK REPORT FOR JUNE.

Mean strength	1,290
Intermittent malaria	1
Remittent malaria	1
Enteritis	1
Febricula	1
Other diseases	21
Total	25

The case of intermittent malaria was off duty nine days, and the remittent malaria was of slight duration. The case of enteritis was of five days' duration, while that of febricula continued for two days. From this report there is no evidence of typhoid fever in this regiment at this time.

In the July report the assistant surgeon makes the following statement:

There has been quite an increase in malarial cases, principally of the remittent type, owing, we think, to our prolonged stay in one camp.

CONDENSED SICK REPORT FOR JULY.

Mean strength	1,310
Remittent malaria	17
Chronic diarrhea	1
Febricula	1
Other diseases	19
Total	38

The case of chronic diarrhea was that of a private in Company G, who reported sick July 4 and was sent to Fort Thomas July 7. One case of remittent fever, that of a private in Company K, was sent to Fort Thomas on the same day. Four of the cases of remittent malaria, not including the one already referred to, were of more than fourteen days' duration. Of these one each came from Companies E, K, A. and F.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength not given.	
Remittent malaria	21
Typhoid fever	5
Undetermined fever	3
Other diseases	12
Total	41

In the September report the assistant surgeon makes the following statement:

We have had a great increase in malarial fever of the remittent type, and also of typhoid fever, owing, we think, to the unsanitary condition of our previous camp at Newport News, Va., and also of this camp (the one at Lexington, Ky.) when we were first located upon it. At present, excellent sanitary conditions prevail here. Quite a number of our cases which we have diagnosed as remittent

malaria have turned out to be typhoid fever. Not being able to retain the sick in the regiment any length of time, it is impossible for us to diagnose these cases with any degree of certainty.

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength	1,304
Remittent malaria	81
Typhoid fever	7
Other diseases	26
Total	114

In the October report the surgeon makes the following statement:

A great many of the cases of malaria, so marked on this report, developed into typhoid fever. We could not hold the cases under observation a sufficient length of time to diagnose them with certainty. All sickness is on the decrease in this regiment. All sanitary precautions are being strictly enforced.

CONDENSED SICK REPORT FOR OCTOBER.

Mean strength	913
Remittent malaria	17
Undetermined fever	18
Typhoid fever	1
Other diseases	14
Total	50

The following is a list of the recognized and probable cases of typhoid fever in this regiment:

A.—At Chickamauga, Ga.

No. 1. Company G: Chronic diarrhea, July 4; sent to Fort Thomas July 6; discharged December 28.

No. 2. Company K: Remittent malaria, July 4 to 20.

No. 3. Company A: Remittent malaria, July 6 to 16.

No. 4. Company A: Typhoid fever, July 7; furloughed July 12. On the regimental records it appears that this man was returned to duty July 12.

No. 5. Company K: Remittent malaria, July 7; sent to Fort Thomas July 7. Here the disease was diagnosed typhoid fever, and the patient was furloughed July 30.

No. 6. Company A: Typhoid fever, July 7; still sick in quarters July 31.

No. 7. Company D: Malaria, July 8; still sick July 31.

No. 8. Company C: Malaria, July 9; still sick in quarters July 31.

No. 9. Company F: Remittent malaria, July 10 to 27.

No. 10. Company G: Remittent malaria, July 10; still sick in quarters July 31.

No. 11. Company F: Malaria, July 10; still sick in quarters July 31.

No. 12. Company A: Malaria, July 10; still sick July 31.

No. 13. Company H: Malaria, July 14; still sick in hospital July 31.

No. 14. Company C: Remittent malaria, July 14; furloughed from division hospital July 28.

No. 15. Company E: Remittent malaria, July 15; still sick July 31.

No. 16. Company B: Diarrhea, July 19; furloughed from division hospital September 10. In hospital this case was diagnosed typhoid fever.

No. 17. Company G: Remittent malaria, July 23; furloughed from division hospital August 12.

No. 18. Company L: Remittent malaria, July 27; still sick September 30.

No. 19. Company B: Remittent malaria, July 28; still sick September 30.

No. 20. Company D: Typhoid fever, July 28; still sick September 30.

No. 21. Company E: Typhoid fever, July 28; still sick September 30.

No. 22. Company K: Typhoid fever, July 28; still sick September 30.

No. 23. Company E: Typhoid fever, July 28; disposition not given.

B.—At Newport News, Va.

No. 24. Company K: Malaria, August 10; still sick October 31.

No. 25. Company H: Malaria, August 10; still sick October 31.

No. 26. Company G: Malaria, August 15; still sick October 31.

No. 27. Company H: Malaria, August 15; still sick October 31.

No. 28. Company H: Malaria, August 15; still sick October 31.

No. 29. Company H: Malaria, August 15; still sick October 31.

No. 30. Musician: Malaria, August 15; still sick October 31.

No. 31. Company D: Typhoid fever, August 15; sent to general hospital at Fortress Monroe; further disposition not given.

No. 32. Company B: Malaria, August 19; still sick September 30.

No. 33. Company G: Malaria, August 19; still sick September 30.

No. 34. Company E: Malaria, August 19; still sick September 30.

No. 35. Company D: Malaria, August 19; still sick September 30.

No. 36. Company C: Malaria, August 21; still sick September 30.

No. 37. Company L: Malaria, August 21; still sick September 30.

No. 38. Company B: Malaria, August 21; still sick October 31.

No. 39. Company B: Malaria, August 26; still sick October 31.

No. 40. Company E: Malaria, August 26; still sick October 31.

No. 41. Company B: Typhoid fever, August 26; sent to division hospital without date; further information concerning this patient is wanting.

No. 42. Company H: Typhoid fever, August 26; sent to division hospital; further disposition not given.

No. 43. Company not given: Typhoid fever, August 26; sent to division hospital; further information not given.

No. 44. Company H: Malaria, August 26; still sick October 31.

C.—At Lexington and subsequently.

No. 45. Company A: Malaria, August 30; still sick October 31.

SUMMARY.

Assembled near Indianapolis, Ind., in April, 1898.

Mustered into United States service early in May, 1898.

Arrived at Chickamauga Park May 17, 1898.

Strength on arrival, 1,023.

Date of first case of probable typhoid fever, July 4, 1898.

Date of first case of recognized typhoid fever, July 7, 1898.

Left Chickamauga Park July 28, 1898.

Strength on departure, 1,312.

Number of cases of probable typhoid fever developed at Chickamauga..... 23

Arrived at Newport News, Va., July 28, 1898.

Left Newport News, Va., August 26, 1898.

Number of cases of probable typhoid fever developed at Newport News, Va..... 21

Arrived at Lexington, Ky., August 30, 1898.

Number of cases of probable typhoid fever developed at Lexington:

From August 30 to 31..... 6

During September..... 116

During October..... 48

From November 1 to 8..... 9

Total number of cases of probable typhoid fever developed in the One hundred and sixtieth Indiana from

May to November, 1898..... 223

These 223 cases were diagnosed as follows:

Typhoid fever..... 47

Malaria..... 172

Diarrhea..... 1

Indigestion..... 1

Intestinal hemorrhage..... 1

Catarrhal jaundice..... 1

Total..... 223

Apparently this was one of the very few volunteer regiments that reached Chickamauga without any of its members being infected with typhoid fever. By reference to the list of probable cases, it will be seen that the first suspicious case was diagnosed chronic diarrhea. It is possible that other cases of prolonged diarrhea were not recorded and consequently have escaped detection.

From the figures given showing the mean strength for the different months, it appears that this regiment received recruits during the months of May, June, and July. Whether the first cases of protracted fever in this command occurred among the recruits or among those who went to Chickamauga originally with the regiment, we have no means of determining.

Giving our attention to the 23 cases that developed at Chickamauga, we find that the most of these occurred in three groups in point of time. From July 4 to 10, inclusive, there were 12 cases. On July 14 and 15 there were 3 cases. On July 27 and 28 there were 6 cases. It will thus be seen that these three groups contained 21 out of the 23 cases. However, we must not lay too much stress upon this point. On the day of leaving Chickamauga, July 28, 1898, it is probable that all the sick, including those who had not been feeling well for some days, were sent to hospital, and this may account for one of the groups. In other words, we can not be certain that the dates given are the exact initial dates of all the cases. Studying these cases by companies, we find that Companies I and M remained free from typhoid fever when the regiment left Chickamauga. The first case in Company I occurred August 30, and then for three successive days there was a new case each day from this company. Company M seems to have escaped typhoid fever altogether until September 22, 1898. From this time on Company M seems to have furnished its proportion, although the total for this company is not so great as for some others. It would be interesting if we could know the position of the mess tents of this company with reference to the sinks at Chickamauga Park and at Newport News.

From the list of probable cases it appears that this regiment was free from typhoid fever for about twelve days directly after reaching Newport News. If this were true, the inference would follow that but few infected persons went with the regiment from Chickamauga to Newport News. However, we are not sure that the break in the records is due to the temporary abeyance of typhoid fever or to an interruption in the keeping of the records. On leaving Newport News and going to Lexington, Ky., the break in the list of cases of probable typhoid fever is much shorter.

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Altenback, Henry S.	Pvt., K.	1898. July 30	Chickamauga, Ga.	Cerebral congestion.
Baker, Judson J.	Pvt., G.	Dec. 4	Columbus, Ga.	Typhoid and meningitis.
Bigley, Roy R.	Corpl., A.	Nov. 9	Division hospital.	Typhoid and peritonitis.
Cole, Eugene L.	Sgt. maj.	Sept. 3	Marion, Ind.	Pernicious malaria.
Lucas, Converse.	Pvt., F.	Nov. 7	Fort Thomas, Ky.	Typhoid.
Paul, Hamilton B.	Pvt., H.	June 14	Camp Thomas, Ga.	Congestion of the brain.
Rizer, Orestes D.	Pvt., M.	Nov. 8	Camp Hamilton, Ky.	Typhoid.
Rosebraugh, Frank ..	Pvt., K.	July 22	Injury to spine.
Sapp, Silas C.	Sgt., H.	Sept. 15	Camp Hamilton, Ky.	Typhoid.
Vawter, George.	Pvt., I.	Oct. 9	Camp Hamilton, Lexington, Ky.	Do.
Wynn, Osear.	Pvt., L.	Oct. 13do.....	Do.
Total deaths				11
Deaths due to typhoid fever				8
Percentage of deaths among probable cases of typhoid fever (223), 3.58.				
Percentage of deaths among recognized cases of typhoid fever (47), 17.02.				

COMMUNICATIONS FROM THE SURGEONS OF THE ONE HUNDRED AND SIXTIETH INDIANA VOLUNTEER INFANTRY.

Medical officers.

John J. Kyle, major and surgeon, Marion, Ind.

Frank W. Foxworthy, captain and assistant surgeon, Indianapolis, Ind.

Eugene Buehler, first lieutenant and assistant surgeon, Indianapolis, Ind.

Lieutenant Buehler states:

Our first camp was at Chickamauga. Little need be said of this camp, as the ground has been thoroughly covered. As to the sanitation of the camp, very little was done. Requisitions were made for disinfectants, especially for chloride of lime, but this was refused on the ground of its being an old-fashioned idea. The lime, we were told, was to be used for cleaning the hospital furniture only. We were instructed to dig sinks from 8 to 10 feet deep, and as the bottom was covered we were to throw dry earth upon it. This answered fairly well until the heavy rains set in. The sinks were soon filled with water, and the offal floated out upon the surroundings. Myriads of flies settled on this and maggots without number were developed, and the stench often became unbearable.

We made requisition for lumber to inclose the sinks, but this was also refused. Lumber was bought by the regiment, however—just enough to shield the men from public view.

The condition of the kitchen sinks was on the same order. The water for the camp was hauled about 4 miles from springs, and was fairly good. However, the mode of transporting the same was objectionable, for the reason that the men hauling it were not cleanly in handling the barrels, and very often neglected to cover the barrels, so permitting the dust from the roads to settle in them.

The bathing facilities were limited. The creek nearby soon became so filthy that the men refused to bathe in it.

The tents were without floors, the men being obliged to sleep upon the ground. This state of affairs lasted throughout our stay at Chickamauga.

Our next camp was at Newport News, Va. Here, as at our

former camp, the sanitary conditions were very poor. This, however was largely due to the fact that we only expected to remain a few days, as we were to go on the transports. The order was revoked and we camped here nearly five weeks. Supplies were very scarce.

Owing to the disappointment of our not going to the front, discipline became lax and orders as to simple sanitary laws were disregarded.

All food was hauled in open wagons which were used for all purposes. Very often bread and meat would come in covered with dust. The water was hauled in barrels.

Our next camp was at Lexington, Ky. This was an ideal camp location. Rigid sanitation was here enforced. All sinks were carefully inclosed and disinfection was probably overdone, as bichloride of mercury, sulphate of iron, chloride of lime, crude oil, and quicklime were required to be thrown into the sinks three times a day. Each tent had its floor, which was mopped twice a week with bichloride of mercury and the floors moved aside to sprinkle the ground beneath with chloride of lime.

The water supply was run in pipes from the city supply to the foot of each company street. Bath houses were erected and the men were compelled to bathe every other day. We were not allowed to remain long in this camp, it being too far from headquarters.

We were ordered to move to a site previously occupied by the Fourteenth Minnesota. This site was in a fearful condition, there having been 40 cases of typhoid fever in this regiment, which had not been sent to the general hospital, but were permitted to remain here at least a week before they were moved.

The excretions from these cases were thrown into the sinks. Our sickness soon began. Whether it was due to this fact or that disease was dormant in the men, was undetermined. At any rate, the first cases of typhoid fever in our regiment became manifest, the sickness before this having been only of intestinal and malarial nature. We had more sickness at this camp than at the other two combined, notwithstanding the fact that every precaution was taken to put the camp in as sanitary a condition as possible.

Our next camp was at Columbus, Ga. This was ideal in every respect. All sinks and tent floors, both for kitchen and the men, were built and put into position before the ground was occupied by the regiment. The water supply was excellent and was also supplied by the city as at Lexington. The same precautions as to disinfection were carried out and sickness visibly decreased. From here we were sent to Matanzas, Cuba.

The regiment was in better health at this place than at any time since mustered in. Only 15 men were in the hospital during our stay of nearly three months. This was largely due to the fact that all refuse was thrown directly into the sea. The sinks were built upon ledges of rock overhanging the sea. The outgoing tide carried everything with it. The water was hauled as in the other cases. I neglected to state that orders had been issued to boil and filter all the water. This was done whenever practicable. However, very often filters were not supplied nor kettles provided for boiling the water as frequently as required.

Notwithstanding the fact that orders were issued to drink only boiled water, the men would drink water from neighboring springs which might easily have become contaminated. Guards were placed to prevent this, wherever it was possible; but it is obvious that each man could not be watched.

Taking all things into consideration, the health in our regiment was remarkable, there being only 12 deaths in the entire regiment of 1,326 men in a full year's service. Two of these deaths were accidental.

Major Kyle thinks the estimate of 223 cases of typhoid fever in this regiment altogether too high. He states that at Chickamauga this regiment was encamped in the rear of and below the Second Division hospital and that it received the drainage from the sinks of this hospital. He is inclined to believe also that a driven well within the regimental lines was contaminated by the drainage from the hospital. He states that the sinks of Company M were within 100 feet of cooking quarters. Jay's Mill well was so located that it received the sewage from the hospital of the Second Division as well as from the sinks of the One hundred and sixtieth Indiana and the Thirty-first Michigan.

The cases of typhoid fever in this regiment that occurred at Matanzas, Cuba, are attributed to infected drinking water obtained in transit from Columbus, Ga., to Charleston, S. C.

FIRST GEORGIA VOLUNTEER INFANTRY.

First Brigade, Second Division, First Army Corps.

This regiment assembled at Camp Northen, Griffin, Ga., and the first sick report covers the month of May. This report is signed by Major Garrard, who makes the following statement:

Diarrhea in an active form seemed to be on the increase, when the water was examined and found to be the cause. After this the water was boiled. There are a few cases of intermittent malaria. The regiment is composed of middle and south Georgians. Quinine has been freely used.

CONDENSED SICK REPORT FOR MAY.

Mean strength	1,014
Intermittent malaria	4
Remittent malaria	6
Diarrhea	4
Other diseases	3
Total	17

The first record made on this report dates May 16. Every case reported is complete, and with the exception of two cases of injury the longest period during which one was excused from duty was six days. This happened in a case of so-called malarial fever. The man reported sick May 18 and returned to duty May 24. There is no evidence of the existence of typhoid fever in this regiment during the month of May. It would be interesting to know how it was determined that the water was the cause of the diarrhea, but the surgeon fails to state this.

In the June report the surgeon makes the following statement:

Malaria is due to the high altitude, damp nights and cool mornings. Diarrhea is probably due to the same cause. Our cooking is improving. We have had a few cases of measles.

CONDENSED SICK REPORT FOR JUNE.

Mean strength.....	1, 121
Intermittent malaria.....	10
Remittent malaria.....	12
Acute diarrhea.....	11
Dysentery.....	5
Other diseases.....	20
Total.....	58

This regiment reached Chickamauga Park, Ga., June 17, coming just a month later than the other two regiments of the same brigade.

In the July report Surgeon Garrard states:

Measles were probably brought to the camp by recruits. I think that the high altitude of Chickamauga Park develops the malaria that the men brought from their homes.

CONDENSED SICK REPORT FOR JULY.

Mean strength not given.	
Intermittent malaria.....	35
Acute diarrhea.....	7
Dysentery.....	2
Typhoid fever.....	3
Other diseases.....	19
Total.....	66

Every case of malaria in this regiment is marked "quotidian." Some of these are suspiciously like typhoid fever; some of the cases of diarrhea and dysentery are also suspiciously like typhoid. Instances of both of these will be given in our list of typhoid cases. The hospital records show that Leiter Hospital received three cases of typhoid fever from this regiment during the month of July. Two of these do not occur upon the regimental report. The Second Division, First Army Corps, Hospital received from this regiment during the month of July five recognized cases of typhoid fever. Confirmation of this statement may be had by examining the list of typhoid cases.

The August report is signed without comment.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength.....	1, 207
Intermittent malaria.....	49
Acute diarrhea.....	6
Dysentery.....	1
Typhoid fever.....	7
Other diseases.....	16
Total.....	79

The small number of cases contained in this regiment is evidently due to the fact that hospital cases only were recorded. It must not be supposed from the small number of sick reported that the sickness in this regiment was actually much less than it was in other regiments.

This regiment left Chickamauga Park, Ga., August 21 and proceeded to Knoxville, Tenn.

The September report is signed without comment.

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength.....	1, 229
Intermittent malaria.....	16
Acute diarrhea.....	2
Dysentery.....	2
Typhoid fever.....	4
Other diseases.....	43
Total.....	67

The regiment during this month was in charge of Lieut. William J. Little. Like the record of the preceding month, this report contains only hospital cases. This regiment, it should be understood, maintained a regimental hospital, and sent the sick only in case of prolonged illness to the division hospital. About September 23 this regiment moved from Camp Poland, near Knoxville, to Camp Price, near Macon, Ga. It is an interesting observation that, notwithstanding the fact that the regimental surgeon had been changed three times, each continues to diagnose all malarias as "quotidian." Indeed it would seem that the hospital steward filled in many of these diagnoses without any special medical advice. We inspected this regiment at Camp Poland and saw in the regimental hospital more cases which we should diagnose from clinical observation as "typhoid" fever on that day than are reported for the entire month.

In October Major Garrard apparently resumed charge of this regiment. He states that the adjutant of the regiment was unable to furnish a statement of the number of men in the command for the month of October and that he has no record, and that all the men were supposed to be on furlough. A detail of six men from each company was left to guard the camp. Malaria continues and mumps are prevalent in the regiment. Typhoid fever developed at Chickamauga, was carried to Knoxville, and since leaving the latter place only sporadic cases have occurred. Only two cases of recognized typhoid fever appear in this regiment. Both of these are brought over from September, but, if this report be correct, there was during the month of October no typhoid fever developed in this regiment. However, as has been stated, the regiment was on furlough, and it is supposed that the record covers only the detail left to take care of the camp. One death from mumps is reported. This was a private in Company M, who died October 3.

CONDENSED SICK REPORT FOR OCTOBER.

Intermittent malaria.....	17
Acute diarrhea.....	1
Dysentery.....	1
Typhoid fever.....	2
Other diseases.....	16
Total.....	37

The following is a list of the recognized and probable cases of typhoid fever found in the records of this regiment:

A.—At Camp Northern, Ga.

No. 1. Company G: Sent to hospital without diagnosis June 6. Here the disease was diagnosed typhoid fever, and the patient was furloughed August 21.

No. 2. Company A: Diarrhea, June 6 to 17.

No. 3. Company G: Diarrhea, June 6 to 17.

No. 4. Company G: Sent to hospital without diagnosis June 11. Here the disease was diagnosed typhoid fever, and the patient was furloughed August 21.

No. 5. Company E: Sent to hospital without diagnosis June 11. Here the disease was diagnosed typhoid fever, and the patient was furloughed October 25.

No. 6. Company G: Sent to hospital without diagnosis June 16. Here the disease was diagnosed typhoid fever, and the patient returned to duty September 20.

No. 7. Company A: Sent to hospital without diagnosis June 16. Here the disease was diagnosed typhoid fever, and the patient was furloughed in July. Exact date not given.

B.—At Chickamauga, Ga.

No. 8. Company G: Sent to hospital without diagnosis June 17. Here the disease was diagnosed typhoid fever, and the patient died August 25.

No. 9. Company H: Sent to hospital without diagnosis June 17. Here the disease was diagnosed malarial fever, and the patient was furloughed August 4.

No. 10. Staff: Sent to hospital without diagnosis June 17. Here the disease was diagnosed remittent malaria, and the patient was furloughed July 12.

No. 11. Company D: Malaria June 28; still sick in division hospital July 31.

No. 12. Company E: Sent to division hospital without diagnosis June 28. Here the disease was diagnosed diarrhea, and the patient was still sick August 31.

No. 13. Company I: Sent to Leiter Hospital without diagnosis July 2. Here the disease was diagnosed malaria, and the patient was furloughed July 11.

No. 14. Company F: Malaria, July 2; died in division hospital August 9. In hospital this case was diagnosed typhoid fever.

No. 15. Company F: Malaria, July 2; furloughed from Leiter Hospital August 10.

No. 16. Company E: Sent to division hospital without diagnosis July 2. Here the disease was diagnosed malaria, and the patient was still sick July 31.

No. 17. Company I: Sent to Leiter Hospital without diagnosis July 2. Here the disease was diagnosed malaria, and the patient was furloughed August 10.

No. 18. Band: Sent to division hospital without diagnosis July 2. Here the disease was diagnosed malaria, and the patient was furloughed July 30.

No. 19. Company G: Sent to Leiter Hospital without diagnosis July 3. Here the disease was diagnosed typhoid fever, and the patient died July 26.

No. 20. Company L: Diarrhea, July 3; still sick in division hospital July 31.

No. 21. Company C: Sent to Leiter Hospital without diagnosis July 3. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 8.

No. 22. Company M: Sent to division hospital without diagnosis July 3. Here the disease was diagnosed malaria, and the patient was furloughed July 20.

No. 23. Company A: Sent to division hospital without diagnosis July 4. Here the disease was diagnosed malaria, and the patient was furloughed July 31.

No. 24. Company C: Malaria, July 4; furloughed from division hospital July 26.

No. 25. Company L: Sent to division hospital without diagnosis July 4; transferred to Fort Thomas July 5. Here the disease was diagnosed typhoid fever, and the patient was returned to duty September 17.

No. 26. Company G: Malaria, July 4; still sick in division hospital July 31.

No. 27. Company D: Sent to division hospital without diagnosis July 4; transferred to Fort Thomas. Here the disease was diagnosed typhoid fever, and the man was returned to duty September 14.

No. 28. Company D: Malaria, July 4; still sick in division hospital July 31.

No. 29. Company L: Sent to Fort Thomas without diagnosis July 5. Here the disease was diagnosed typhoid fever, and the patient was discharged October 6.

No. 30. Company G: Typhoid fever, July 5; died in division hospital July 21.

No. 31. Company B: Typhoid fever, July 6; furloughed from division hospital July 16.

No. 32. Company E: Sent to division hospital without diagnosis July 6. Here the disease was diagnosed malaria, and the patient was still sick in hospital July 31.

No. 33. Company not given: Malaria, July 7; still sick in division hospital July 31.

No. 34. Company G: Malaria, July 9; still sick in division hospital July 31.

No. 35. Company I: Sent to division hospital without diagnosis July 10. Here the disease was diagnosed continued malaria, and the patient was furloughed July 31.

No. 36. Company E: Malaria, July 12; still sick in division hospital July 31.

No. 37. Company C: Typhoid fever, July 13; furloughed from Sternberg Hospital August 31.

No. 38. Company G: Malaria, July 15; still sick in division hospital July 31.

No. 39. Company A: Dysentery, July 16; still sick in division hospital July 31.

No. 40. Company D: Malaria, July 18; still sick in division hospital July 31. In hospital this case was diagnosed typhoid fever.

No. 41. Company D: Sent to division hospital without diagnosis July 18. Here the disease was diagnosed dysentery, and the patient was still sick August 31.

No. 42. Company B: Typhoid fever, July 19; still sick in division hospital August 31. This man was kept in the regiment until August 3.

No. 43. Company M: Malaria, July 21; furloughed August 10.

No. 44. Company D: Malaria, July 22; furloughed August 12.

No. 45. Company I: Sent to division hospital without diagnosis July 27. Here the disease was diagnosed malaria, and the patient was furloughed August 20.

No. 46. Company E: Sent to division hospital without diagnosis July 27. Here the disease was diagnosed malaria, and the patient was still sick August 31.

No. 47. Company M: Malaria, July 27; furloughed from division hospital August 29. In hospital this case was diagnosed typhoid fever.

No. 48. Company F: Sent to division hospital without diagnosis July 28. Here the disease was diagnosed typhoid fever, and the patient was still sick July 31.

No. 49. Company not given: Malaria, July 28; still sick in division hospital August 31.

No. 50. Company D: Sent to division hospital without diagnosis July 29. Here the disease was diagnosed dysentery, and the patient died August 12.

No. 51. Company D: Sent to division hospital without diagnosis August 1. Here the disease was diagnosed enteritis, and the patient was furloughed August 20.

No. 52. Company K: Sent to division hospital without diagnosis August 1. Here the disease was diagnosed enteritis, and the patient was furloughed August 13.

No. 53. Company not given: Malaria, August 2; still sick in division hospital August 31.

No. 54. Company A: Malaria, August 2; still sick in division hospital August 31. This man is recorded as having had malaria July 24 to 31. He probably had typhoid fever, the initial date of which was July 24.

No. 55. Company not given: Diarrhea, August 3; still sick August 31.

No. 56. Company K: Sent to division hospital without diagnosis August 3. Here the disease was diagnosed typhoid fever, and the patient was furloughed August 12.

No. 57. Company D: Malaria, August 4; furloughed from division hospital September 10. In hospital this case was diagnosed typhoid fever.

No. 58. Company M: Malaria, August 6; still sick in division hospital August 31.

No. 59. Company not given: Malaria, August 8; still sick in division hospital August 31.

No. 60. Company not given: Malaria, August 8; still sick in division hospital August 31.

No. 61. Company L: Malaria, August 8; still sick in division hospital August 31.

No. 62. Company L: Malaria, August 8; still sick in division hospital August 31.

No. 63. Company C: Malaria, August 10; still sick in division hospital August 31.

No. 64. Company E: Malaria, August 11; furloughed from division hospital August 29.

No. 65. Company C: Malaria, August 11; furloughed from division hospital September 10. In hospital this case was diagnosed typhoid fever.

No. 66. Company G: Sent to division hospital without diagnosis August 12. Here the disease was diagnosed enteritis, and the patient was furloughed August 24.

No. 67. Company A: Malaria, August 13; still sick in division hospital August 31.

No. 68. Company K: Malaria, August 14; still sick in division hospital August 31.

No. 69. Band: Malaria, August 15; still sick in division hospital August 31.

No. 70. Company M: Malaria, August 16; still sick in division hospital August 31.

No. 71. Company F: Diarrhea, August 16; still sick in division hospital August 31.

No. 72. Company G: Malaria, August 18; still sick in division hospital August 31.

No. 73. Company E: Malaria, August 18; still sick in division hospital August 31.

No. 74. Company C: Malaria, August 18; still sick in division hospital August 31.

No. 75. Company L: Malaria, August 18; still sick in division hospital August 31.

No. 76. Company E: Sent to Sternberg Hospital without diagnosis, August 20. Here the disease was diagnosed malaria, and the patient was furloughed August 26.

No. 77. Company A: Diarrhea, August 21; still sick August 31.

No. 78. Company C: Malaria, August 21; sent to division hospital August 25.

No. 79. Company K: Malaria, August 21; sent to division hospital August 25.

No. 80. Company G: Malaria, August 21; sent to division hospital August 25.

No. 81. Company D: Malaria, August 21; sent to division hospital August 25.

No. 82. Company D: Malaria, August 21; sent to division hospital August 25.

No. 83. Company C: Malaria, August 21; sent to division hospital August 25.

No. 84. Company M: Dysentery, August 21; sent to division hospital August 27.

No. 85. Company I: Diarrhea, August 21; sent to division hospital August 25.

C.—At Knoxville, Tenn.

No. 86. Company M: Malaria, August 25; died in division hospital October 3.

No. 87. Company D: Sent to division hospital without diagnosis August 26. Here the disease was diagnosed typhoid fever and the patient died September 22.

No. 88. Company D: Sent to division hospital without diagnosis August 26. Here the disease was diagnosed typhoid fever and the patient was furloughed September 22.

No. 89. Company F: Malaria, August 27; still sick in division hospital August 31.

No. 90. Company H: Malaria, August 27; still sick in division hospital in September.

No. 91. Company I: Sent to division hospital without diagnosis August 29. Here the disease was diagnosed typhoid fever and the patient was furloughed September 30.

No. 92. Company D: Malaria, August 30; furloughed from division hospital September 21. In hospital this case was diagnosed typhoid fever.

No. 93. Company L: Malaria, August 30; sick in division hospital in September.

No. 94. Company F: Malaria, August 30; sick in division hospital in September. In hospital this case was diagnosed typhoid fever.

No. 95. Company M: Sent to division hospital without diagnosis August 31. Here the disease was diagnosed enteric fever and the patient was furloughed September 21.

No. 96. Company D: Diarrhea, September 1; sent to division hospital September 2. In hospital this case was diagnosed typhoid fever.

No. 97. Company F: Malaria, September 1; still sick in division hospital September 30.

No. 98. Band: Diarrhea, September 3; still sick in division hospital September 30.

No. 99. Company D: Sent to division hospital without diagnosis September 5. Here the disease was diagnosed typhoid fever, and the patient died September 24.

No. 100. Company D: Malaria, September 9; sent to division hospital September 30.

No. 101. Company K: Malaria, September 9; still sick September 30.

No. 102. Company K: Malaria, September 9; sent to division hospital September 21, and transferred to City Hospital October 1. In hospital this case was diagnosed typhoid fever.

No. 103. Company D: Sent to division hospital without diagnosis, September 10. Here the disease was diagnosed typhoid fever and the patient was furloughed September 16.

No. 104. Company F: Malaria, September 10; sent to division hospital September 30.

No. 105. Company E: Malaria, September 10; still sick in division hospital September 30. In hospital this case was diagnosed typhoid fever.

No. 106. Company F: Malaria, September 10; still sick in division hospital September 30.

No. 107. Company I: Diarrhea, September 10; still sick in division hospital September 30.

No. 108. Company K: Malaria, September 10; still sick in division hospital September 30. In hospital this case was diagnosed typhoid fever.

No. 109. Company F: Indigestion, September 12; still sick in division hospital September 30.

No. 110. Company B: Gastritis, September 12; still sick in division hospital September 30.

No. 111. Company L: Malaria, September 12; sent to division hospital September 24.

No. 112. Company F: Malaria, September 15; still sick in division hospital September 30.

No. 113. Company D: Sent to division hospital without diagnosis September 16. Here the disease was diagnosed typhoid fever; further disposition of the patient is not given.

No. 114. Company I: Sent to division hospital without diagnosis September 17. Here the disease was diagnosed typhoid fever; further disposition is not given.

No. 115. Company K: Typhoid fever, September 23; sent to division hospital September 30 and transferred to City Hospital October 4.

No. 116. Company A: Sent to division hospital without diagnosis September 23. Here the disease was diagnosed remittent malaria, and the patient was returned to duty November 13.

No. 117. Company not given: Malaria, September 23; furloughed October 4.

No. 118. Company M: Malaria, September 23; furloughed October 4.

No. 119. Company D: Malaria, September 27; furloughed October 4.

No. 120. Company not given: Sent to hospital without diagnosis October 19. Here the disease was diagnosed malaria and the patient was still sick October 31.

SUMMARY.

Assembled at Camp Northern, Griffin, Ga., in May, 1898.	
Mustered into United States service in May, 1898.	
Arrived at Chickamauga Park June 17, 1898.	
Mean strength on arrival, 1,121.	
Date of first case of probable typhoid fever, June 6, 1898.	
Date of first case of recognized typhoid fever, June 6, 1898.	
Left Chickamauga Park August 21, 1898.	
Strength on departure, 1,212.	
Number of cases of probable typhoid fever developed at Chickamauga, and before reaching this place	85
Number of cases of probable typhoid fever developed at Knoxville:	
From August 22 to 31	10
During September	25
Total number of cases of probable typhoid fever developed in the First Georgia Volunteer Infantry from May to September 30, 1898	120
These 120 cases were diagnosed as follows:	
Typhoid fever	36
Enteric fever	1
Malaria	64
Diarrhea	10
Dysentery	4
Enteritis	3
Gastritis	1
Indigestion	1
Total	120

This regiment developed typhoid fever in its State encampment and had seven probable cases before it reached Chickamauga. We will compare the history of this regiment with that of the Thirty-first Michigan, because they were brigaded together at Chickamauga

and at Knoxville. It can not be said that either of these regiments infected the other with typhoid fever, because the Georgia regiment had developed typhoid fever before it went to Chickamauga, and the Michigan regiment had developed typhoid fever at Chickamauga before the arrival of the Georgia regiment. The number of cases developed in each of these regiments up to September 30 is, as shown by the records, as follows:

In the Michigan regiment	188
In the Georgia regiment	120

These figures apparently show that the Michigan regiment was much more widely infected, but this difference is probably more apparent than real, because many of the cases in the Michigan regiment would not be classed among the probable typhoids had they not remained under observation during October. In other words, the fact that we have no report, or no satisfactory report, from a given command during the month of October often leaves us in doubt concerning the nature of many cases the initial date of which fell in September.

Both of these organizations maintained regimental hospitals which at the time of our inspection were not in commendable shape. It is true, however, that they were in no worse condition than the division hospital was at the same time.

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Bates, William	Pvt., A	1898, Sept. 7	Knoxville, Tenn.	Hemorrhage, typhoid.
Benton, Henry G.	Pvt., G	Aug. 25	United States General Hospital, Fort McPherson, Ga.	Typhoid.
Bowen, James O.	Pvt., D	Sept. 5	Chickamauga, Ga.	Do.
Buford, Wm.	Pvt., M	Oct. 3	Division hospital.	Do.
Burton, Henry J.	Pvt., G	Aug. 25	Fort McPherson, Ga.	Do.
Chilson, Charles M.	Pvt., K	Sept. 13	Savannah, Ga.	Inflammation of the bowels.
Davis, Andrew M.	Pvt., G	July 26	Leiter Hospital, Ga.	Typhoid.
Devore, Elbert S.	Pvt., F	Aug. 8	Chickamauga, Ga.	Fever.
Shelter, Charles E.	Pvt., D	Sept. 24	Knoxville, Tenn.	Typhoid.
Youles, James M.	Pvt., G	July 21	Leiter Hospital, Ga.	Do.
Total deaths				10
Deaths due to typhoid fever				9
Percentage of deaths among probable cases of typhoid fever (120). 7.5.				
Percentage of deaths among recognized cases of typhoid fever (36). 25				

COMMUNICATIONS FROM THE SURGEONS OF THE FIRST GEORGIA VOLUNTEER INFANTRY.

Medical officers.

James I. Garrard, major and surgeon, Macon, Ga.
William J. Little, lieutenant and assistant surgeon, Sparta, Ga.
Joseph G. Jarrell, lieutenant and assistant surgeon, Savannah, Ga.

Lieutenant Jarrell states:

The First Georgia Regiment, United States Volunteers, was mustered in at Griffin, Ga., the site of the State encampment, where every convenience in the way of bath houses, kitchens, and privies were at the disposal of the troops. The water was supplied from the city water works, being obtained from a large spring near the encampment. The men were all carefully examined, and, as well as I remember, we had no typhoid fever in the First Georgia

until after we went to Chickamauga Park. We had diarrhea and dysentery, but I think that these were due mostly to improper cooking.

At Camp Thomas our camp was very well located, with fair drainage, but a little too shady. The drinking water was obtained from a large spring on the Ringold road about 4 miles from the camp. No water main was near our camp, but there were two wells, one used by a Pennsylvania regiment and one located at the junction of the Brotherton and Reed roads. Both wells, I think, contained good water. Water was sometimes obtained from these wells. The company sinks were located at the foot of each street and they, as well as the whole camp, were kept well policed. The excrement was covered with dry earth. Col. A. R. Lawton gave his personal attention to the inspection of the camp. At Camp Thomas we had a number of cases of malarial fever soon after our arrival. This was natural, our boys coming mostly from the lower counties of the State. I was transferred to the Reserve Ambulance Corps about July 12 and did not rejoin my regiment until my return from Porto Rico for the purpose of being mustered out of service. Doctor Garrard, of Macon, Ga., the major and surgeon, can give you the balance of the record.

Before leaving Camp Thomas I knew there would be much sickness from the carelessness of the troops and the way they were depositing their excrement broadcast over the land, and the careless way in which the sinks were managed in almost every regiment and at the hospitals. The water supply I considered excellent, and, for myself, all the water I drank came from Chickamauga Creek. Dr. Lawrence Smith, of the reserve hospital, drank nothing but boiled water, but died with typhoid fever soon after our arrival in Porto Rico.

In Porto Rico there was no typhoid fever when we arrived, except what had broken out on the transports during the voyage. It was called malarial fever, and no care or caution was exercised. At Guayamo, P. R., the camp of the Fourth Ohio Regiment was splendidly located on a hill where a most excellent water supply was obtainable. The camp was kept in good condition. Typhoid fever broke out in the regiment and they had a number of cases. It was called malarial fever. I succeeded in convincing some of the surgeons that we were having typhoid fever. I was in charge of the typhoid ward of the hospital, which had been located in the city itself. The medical inspector several times reported cases as "malarial fever" to the authorities, having changed my diagnosis. In several instances I had the unpleasant pleasure of verifying my diagnoses by autopsies. I disposed of all fecal matter and urine by burning them in a crematory that I had erected in the yard of the hospital, and had the good luck of having only one case among my attendants. The Third Illinois Regiment had a good location for their camp, but it was soon the dirtiest and filthiest camp I have ever seen. Most of the sickness came from that regiment, and nearly all the typhoid fever. The Signal Corps was located south of the city near the cane fields, the least desirable camp site of them all, but the camp was kept clean and healthful. They had little sickness. The reserve hospital was located on a hill east of Guayamo. The water was obtained from the waterworks. The fecal matter was thrown into sinks without being disinfected. Flies swarmed everywhere. I urged the building of a crematory, but it was not done. A number of the attendants had typhoid fever.

I do not think in a single case the water supply carried the infection. The spread of the disease was due to the careless disposition of filth, and the flies were the means of dissemination, swarming from the sinks to the kitchens. A mistake was made in many cases. Owing to the absence of certain symptoms, many of the surgeons diagnosed typhoid fever as malarial fever. I would always advise the isolation of typhoid-fever cases and thorough disinfection of everything. The location of the camp had nothing to do with the spread of the disease, for every site chosen was soon changed by the soldiers into a filthy place.

Major Garrard has sent us a communication, which, however, contains no additional information of value. He thinks that we have greatly overestimated the number of cases of typhoid fever in his regiment. In one point he differs from Lieutenant Jarrell, and in this Major Garrard is certainly right. The Major states that typhoid fever did appear in this regiment at its State encampment. He gives the number of cases of this disease at that place as from five to eight, and it may be seen that we have placed this number at seven.

ONE HUNDRED AND FIFTY-EIGHTH INDIANA VOLUNTEER INFANTRY.

Second Brigade, Second Division, First Army Corps.

The only information in our possession concerning this regiment is that furnished by the monthly sick reports and the records of the Second Division hospital. The first sick report covers the dates May 12 to May 31, inclusive. In this report we find the following statement made by the surgeon in charge:

The health of the command is good. There has been a slight epidemic of measles, but this is now under control. There has been some diarrhea, due, I think, to change of water and to injudicious eating. The general sanitary condition of the camp is good.

CONDENSED SICK REPORT, MAY 12 TO MAY 31, INCLUSIVE.

Mean strength	1,023
Intermittent malaria.....	3
Other diseases.....	15
Total	18

It is an interesting fact that diseases were diagnosed as malaria in this regiment as early as May, while in the other regiments of the same brigade malaria did not occur, according to the sick reports, until much later. This is another evidence that, in fact, there was no malaria in the brigade. The cases of so-called malaria in this report are the only ones of interest to us. Two of these were off duty for only two days. The third case is diagnosed as "tertian intermittent;" and it appears from the report that the patient was left at the City Hospital at Indianapolis and returned to duty June 30. This is the only possible case of typhoid fever in this report. The regiment was under the charge of Capt. Homer I. Jones.

CONDENSED SICK REPORT FOR JUNE.

Mean strength.....	1,320
Intermittent malaria.....	5
Remittent malaria.....	3
Acute diarrhea	1
Dysentery	5
Other diseases.....	43
Total	57

In the June report Captain Jones makes the following statement:

The general health of the command continues good. Occasional cases of measles occur. There is also a slight epidemic of diarrhea.

Both of these diseases are more prevalent among recruits. The general sanitary condition of the camp is good.

The only possible cases of typhoid fever so far as the records show during the month of June are the following:

A private of Company C appeared on sick report June 6 under the diagnosis of "acute indigestion." He remained sick in quarters until June 28, when he was transferred to Leiter Hospital. On the records of this hospital his case is diagnosed as "acute enteritis with local peritonitis." He was operated upon for appendicitis on June 30 and died July 1. There is no statement as to whether or not an autopsy was made. After death the diagnosis of acute enteritis was continued.

On June 25 a private of Company G reported with diarrhea. This man remained sick in quarters until July 20. On June 28 a private of Company E reported with malaria. This man remained sick in quarters until August 13, when he was furloughed home.

On the same date a private of Company I reported sick under the diagnosis of typhoid fever. He was sent to Leiter Hospital July 3, and was furloughed August 6.

On the next day, June 29, a private of Company D reported with typhoid fever and was sent to division hospital, where he died August 5.

It will be seen from these facts that typhoid fever had become fairly well established in the regiment at the end of June.

Lieut. Paul J. Barcus was in charge of this regiment when the July report was made. He offers no comments.

CONDENSED SICK REPORT FOR JULY.

Mean strength	1,315
Intermittent malaria	7
Remittent malaria	12
Acute diarrhea	2
Typhoid fever	2
Dysentery	7
Enteritis	1
Other diseases	36
Total	67

The two cases of recognized typhoid fever reported in this month are the two individuals already mentioned as having this disease in June.

Of the cases included in the above report, at least seven were probably typhoid fever. These are as follows:

No. 1. Diarrhea, June 25; sent to division hospital; returned to duty July 20.

No. 2. Dysentery, June 24; sent to Fort Thomas. Here the diagnosis was changed to typhoid fever.

No. 3. Remittent malaria, July 3; sent to Fort Thomas, where the disease was diagnosed typhoid fever.

No. 4. Remittent malaria, July 12; returned to duty July 28.

No. 5. Remittent malaria, July 11 to 30.

No. 6. Remittent malaria, July 11 to 31.

No. 7. Remittent malaria, June 28 to September 16.

There were several other cases of typhoid fever during the month of July which do not appear on this report. These are as follows:

No. 1. Malaria, July 14; died September 21.

No. 2. Malaria, July 23; furloughed August 18.

No. 3. Malaria, July 11 to August 19.

No. 4. Malaria, July 14 to August 28.

No. 5. Malaria, July 2 to August 19.

No. 6. Malaria, July 10; sent to Sternberg Hospital August 31. Here the disease was diagnosed as typhoid fever, and the patient was furloughed September 22.

No. 7. Malaria, July 21; furloughed August 8.

No. 8. Malaria, July 11 to September 16.

No. 9. Malaria, July 28; furloughed August 13.

No. 10. Malaria, July 30; sick September 30.

No. 11. Malaria, July 18; furloughed August 7.

It will thus be seen that most of the cases diagnosed as malaria in this regiment in the month of July were actually cases of typhoid fever.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength	1,284
Intermittent malaria	97
Remittent malaria	20
Acute diarrhea	9
Typhoid fever	3
Other diseases	46
Total	175

In a later report 4 of the intermittent malarias and 1 remittent malaria in this report were changed in diagnosis to typhoid fever. This would make the corrected report stand as follows:

Intermittent malaria	93
Remittent malaria	19
Acute diarrhea	9
Typhoid fever	8
Other diseases	46
Total	175

Seventy of the cases designated as malaria, after making the above correction, proved subsequently to be typhoid fever, as shown by hospital reports.

This regiment left Chickamauga Park August 26 and went to Camp Poland, near Knoxville, Tenn. It remained here about two weeks, as will be seen later.

The September report was made by Maj. Fred R. Charlton, who makes the following statement:

The regiment left Knoxville, Tenn., for State camp, Indianapolis, with a view of being mustered out on September 12. The regiment was disbanded on thirty days' furlough September 17. On arrival at Indianapolis the sick were turned over to the State Hospital.

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength	1,278
Intermittent malaria	61
Remittent malaria	9
Acute diarrhea	4
Typhoid fever	2
Other diseases	14
Total	90

Nearly all of the malarias reported in September are brought over from July and August. Of the 2 cases of typhoid fever reported, both died. The initial date of one of these was July 14, and that of the other September 6.

We have not thought it profitable to discuss the relationship of the various diseases reported in this regiment. The incompleteness of the report, together with the fact that the regiment was dispersed so early, would render information gained in such a study of doubtful value.

The following is a summary concerning typhoid fever in this regiment:

Total cases tabulated	128
Number with regimental diagnosis of typhoid fever.....	12
Number with regimental diagnosis of malaria	90
Number with regimental diagnosis of diarrhea	2
Number without regimental diagnosis but found on hospital report	24
Total	128

It would be exceedingly interesting if we could follow the members of this regiment, after dispersion to their homes, and ascertain how many of them had typhoid fever.

SUMMARY.

Assembled near Indianapolis Ind., in April, 1898.	
Mustered into United States service May 12, 1898.	
Arrived at Chickamauga Park May 18, 1898.	
Strength on arrival, 1,023.	
Date of first case of probable typhoid fever, June 6, 1898.	
Date of first case of recognized typhoid fever, June 24, 1898.	
Left Chickamauga Park August 25, 1898.	
Strength on departure, 1,288.	
Number of cases of probable typhoid fever developed at Chickamauga	95
Arrived at Knoxville, Tenn., August 26, 1898.	
Left Knoxville September 12, 1898.	
Number of cases of probable typhoid fever developed at Knoxville	33
Total number of cases of probable typhoid fever developed in the One hundred and fifty-eighth Indiana, from May to September 12, 1898	128
These 128 cases were diagnosed as follows:	
Typhoid fever	49
Continued fever	1
Malaria	74
Diarrhea	2
Gastritis	1
Dysentery	1
Total	128

We are left in doubt as to whether or not this regiment carried the typhoid infection with it to Chickamauga. It is quite certain that it became infected quite as widely as any regiment in the brigade while at Chickamauga. Although this command did not leave Knoxville until September 12, 1898, the last cases of fever reported occurred September 6. It is not at all prob-

able that typhoid fever ceased so abruptly and so quickly after the command left Chickamauga. The histories of other regiments of this division render such a supposition altogether untenable. The sudden and premature cessation was undoubtedly in the keeping of the records and not in the occurrence of the disease.

None of the regiments of the Second Brigade of this division changed the location of their camps while at Chickamauga. We may therefore with possible profit compare the records of the One hundred and fifty-eighth Indiana with those of the First Georgia, in order to ascertain whether or not the latter improved its condition or lessened the number of cases of typhoid fever by changing its site at Chickamauga. The first camp at Chickamauga of the First Georgia and the camp of the One hundred and fifty-eighth Indiana were immediately adjacent. The second camp of the First Georgia was some distance away and quite isolated from any other command. From one point of view the disadvantage, in making such a comparison as this proposed, was with the Georgia regiment, which went to Chickamauga quite widely infected with typhoid fever, while the One hundred and fifty-eighth Indiana had not developed a recognized case of typhoid fever up to the time of the arrival of the First Georgia. From another point of view the disadvantage would be with the Indiana regiment, because it had already occupied its camp site for one week when the Georgia regiment arrived. For these reasons it must be admitted that conclusions drawn from such a comparison must not be considered as very convincing. However, we can state the facts without placing too much stress upon the conclusions. The One hundred and fifty-eighth Indiana occupied one site at Chickamauga from May 18 to August 25, and developed 128 cases of probable typhoid fever up to September 12, 1898; while the First Georgia remained at Chickamauga from June 17 to August 21, dividing this time about equally between two camp sites, and developed 120 cases of probable typhoid fever up to September 30, 1898. If we are to draw any conclusions from these data it must be admitted that the Georgia regiment acted wisely when it changed its location at Chickamauga.

Let us pursue this question further and carry out a similar comparison between two other regiments in these two brigades. The Thirty-first Michigan of the First Brigade and the Sixth Ohio of the Second Brigade were on adjacent encampments during May, June, and the greater part of July at Chickamauga. Both of these regiments undoubtedly came onto the ground infected with typhoid fever. The Ohio regiment retained its original site during its entire stay at Chickamauga, and developed up to September 30, 1898, 291 cases of probable typhoid fever. The Michigan regiment changed its location at Chickamauga the last of July or the first of August, and developed up to September 30,

1898, 239 cases of probable typhoid fever. Both of these commands reached Chickamauga practically the same day, left Chickamauga within the same week, and took up encampments not far removed from one another at Knoxville, Tenn. Again, if it be permissible to draw any conclusions from these data, it must be claimed that the Michigan regiment was benefited by changing its camp site at Chickamauga.

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Allis, Newton D.....	Pvt., B	1898, Oct. 29	Athens, Ind.....	Typhoid.
Boothroyd, Louis G....	Mus., G	Sept. 19	Camp Mount, Indianapolis, Ind.	Typhoid, with perforation of bowel and peritonitis as a complication.
Britton, Benjamin F..	Pvt., M	Aug. 17	Camp Thomas, Ga....	Typhoid.
Jennings, Ashley.....	Pvt., C	July 1	Lester Hospital, Ga....	Acute enteritis, local peritonitis.
Keir, William H.....	2d Lt., B	Aug. 8	St. Petersburg, Fla...	Typhoid malaria.
McMullen, Harry A...	Pvt., D	Aug. 5	Camp Thomas, Ga....	Typhoid.
Mitchell, Harry.....	Pvt., M	Oct. 10	Camp Mount, Indianapolis, Ind.	Do.
Moon, John A.....	Pvt., L	Oct. 20	do.....	Do.
Richie, W.....	(?)	Aug. —	do.....	Do.
Rosberg, Victor G.....	Corpl., A	Sept. 30	At home.....	Do.
Stevens, Ira W.....	Pvt., B	Sept. 2	Chickamauga, Ga....	Do.
Wiley, Clarence C.....	Pvt., D	Sept. 17	Camp Mount, Indianapolis, Ind.	Pneumonia.

Total deaths.....	12
Deaths due to typhoid fever.....	10
Percentage of deaths among cases of probable typhoid fever (128), 7.81.	
Percentage of deaths among cases of recognized typhoid fever (49), 20.4.	

COMMUNICATIONS FROM THE SURGEONS OF THE ONE HUNDRED AND FIFTY-EIGHTH INDIANA VOLUNTEER INFANTRY.

Medical officers.

Frederick R. Charlton, major and surgeon, Indianapolis, Ind.
Homer I. Jones, captain and assistant surgeon, Indianapolis, Ind.
Paul J. Barcus, first lieutenant and assistant surgeon, Crawfordsville, Ind.

Under date of July 20, 1899, Captain Jones furnished us with the following information:

Our location at Chickamauga was in a small grove at the east of the park and our colonel was ordered to make the distance between companies' and officers' tents very short, as it was necessary to put two regiments in between it and the eastern end of the park. We were forced to contract our lines to half the regulation distances between companies and regiments. The Sixth Ohio Volunteer Infantry had its line only about 30 feet from ours, and the sinks of this regiment and the kitchens of the First West Virginia were only 12 or 15 feet apart. There were two or three wells within our lines, but the large demand for water soon exhausted them. After this we obtained water, first from Crawfish Spring and a little later from Blue Spring. Our sinks could not be dug deeper than 18 or 20 inches. The ground was impervious and liquid excretions soon filled these shallow sinks. Attempts to add dry earth were futile, because the dry clay did not absorb the moisture, and when it was thrown into the sinks the contents overflowed. Moreover, when it rained the sinks frequently overflowed and polluted the soil for some distance about them.

In my judgment the causes of typhoid fever among the troops were:

First. The condition of sinks, of which I have already spoken.

Second. The drinking of water which had not been boiled, and especially the drinking of water from the shallow wells.

Third. I believe that the flies carried the infection from the sinks to the kitchens and mess tents.

Fourth. The troops were crowded too closely together.

Fifth. Regimental camp sites should have been frequently changed.

Sixth. The food was improperly prepared and was not appetizing and easily digested. It frequently acted as an irritant and prepared the body for the reception of the typhoid germ.

Seventh. The men ate all manner of food obtained from hucksters.

Major Charlton submits the following statement:

(1) The regiment reached Chickamauga without adequate medical supplies, nearly everything except the field case having been held by Governor Mount as State property, and this was granted us only upon urgent request.

(2) In my opinion very many cases of mild typhoid fever passed under the diagnoses of dysentery, diarrhea, malaria, enteritis, etc.

(3) In my opinion there was very little typical malaria in Chickamauga. I am able to recall only a few cases that I should have diagnosed malaria. There were many cases of somewhat indefinite type, showing malarial tongue and bilious symptoms, with periodical headache and slight fever.

(4) Very many developed typhoid fever after the regiment was mustered out and were treated in their homes.

(5) The change from Chickamauga to Knoxville was so grateful to everyone that I suspect that the mental uplift was such as to lead many men not to report themselves sick until it was absolutely necessary.

SIXTH OHIO VOLUNTEER INFANTRY.

Second Brigade, Second Division, First Army Corps.

The call to which this regiment responded was issued April 20, 1898. The command assembled at Toledo, Ohio, April 25. Four days later it went to Columbus, Ohio. It was mustered into the United States service May 12, and remained at Columbus from April 29 to May 17. While here it was supplied with city water and used sinks for the reception of fecal matter.

According to the testimony of Capt. J. D. Howe, made to our board in September, at Knoxville, Tenn., most of the sickness at Columbus consisted of "bronchial coughs and colds."

May 17 this regiment left Columbus, Ohio, and the next day it reached Chickamauga Park, Ga. Here it was brigaded with the First West Virginia and the One hundred and fifty-eighth Indiana.

The regimental camp was located in the woods on a sloping knoll, and was fairly well drained except on one flank. During the first days of its stay at Chickamauga water was obtained from Jays Mill well. Later all the drinking water was brought in barrels from Blue Spring. This brigade was in camp nearly 2 miles distant from any of the pipes carrying Chickamauga Creek water. The company sinks were located about 125 feet to the rear of the mess tents. Colonel McMakin stated to us that

orders were issued instructing that the company sinks should be dug to a depth of 6 feet and that the contents should be covered with earth not less than twice a day. However, the rocky nature of the soil rendered it quite impossible to dig the pits to the depth specified in the order. Several officers testified that both the company and kitchen sinks soon became exceedingly foul and that their contents were filled with maggots.

This command occupied one site during its stay at Chickamauga. Each tent stood in exactly the same place during the whole of this time. The regiment left Chickamauga August 27 and proceeded to Knoxville, Tenn.

In the sick report for May A. L. Osborne, surgeon in charge, makes the following statement:

The medical condition of the command is good. There has been an epidemic of measles, and the patients have been placed in quarantine and carefully treated.

CONDENSED SICK REPORT FOR MAY.

Mean strength	864
Typhoid fever	1
Other diseases	18
Total	19

It should be understood that under the head of "other diseases," we include those accidents and diseases which have no relation to typhoid fever.

The June report was made by Capt. John B. Howe. In this he offers no comments.

CONDENSED SICK REPORT FOR JUNE.

Mean strength	894
Malaria	3
Diarrhea	2
Gastric disorders	3
Indigestion	3
Other diseases	18
Total	29

The report for July was also made by Captain Howe, and contains no special remarks.

CONDENSED SICK REPORT FOR JULY.

Mean strength	1,319
Malaria	11
Diarrhea	14
Indigestion	15
Gastric disorders	4
Other diseases	16
Total	60

In the cases reported Captain Howe makes the following statement:

This command was in camp at Camp George H. Thomas from May 19, 1898, to August 27, 1898. On the latter date the command departed for Camp Poland, Knoxville, Tenn., arriving August 29. Since our arrival at this camp about 20 cases of mild malarial remittent fever have developed, which were contracted at Camp Thomas. With the exception of these cases the medical condition of the camp is excellent, there being no other diseases of serious nature.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength	1,323
Typhoid fever	1
Malaria	103
Diarrhea	100
Indigestion	62
Gastric disorders	9
Dysentery	1
Other diseases	41
Total	317

In the September report Captain Howe adds:

The health of the command is improving, there being no diseases of a serious nature prevalent. Most of the sickness are cases of a minor nature, which do not call for report or comment.

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength	1,293
Typhoid fever	1
Malaria	203
Indigestion	127
Diarrhea	87
Gastric disorders	19
Dysentery	1
Other diseases	102
Total	540

In the October report Acting Asst. Surg. J. B. Alcorn makes the following statement:

The health of the command is improving. The prevailing disease that has caused the sickness we have had is typhoid fever. The measures adopted for its prevention have been isolation of all cases and the perfect sanitary condition of the command. The daily report at sick call is composed of minor cases that need no comment.

CONDENSED SICK REPORT FOR OCTOBER.

Mean strength	1,276
Typhoid fever	1
Malaria	205
Indigestion	71
Diarrhea	18
Gastric disorders	10
Dysentery	8
Other diseases	66
Total	379

Only two cases were recognized as typhoid fever by the regimental surgeon during the whole of the time covered by the above-mentioned reports. The first of these was sick on May 18 when the regiment reached Chickamauga. This man was kept in the regimental hospital, where he died May 24.

The second case of recognized typhoid fever was detected when the regiment reached Knoxville, August 29. This man was carried on the sick reports for August, September, and October, and was still sick when the last report was made.

Our knowledge of this regiment closes with the October report, with the exception of a few cases found admitted to hospital in November.

The number of individuals who are recorded as hav-

ing suffered from malaria amount to 273. Some of these occurred on the sick reports for two or three months. This explains why this number does not agree with the sum of the reported cases in the different months. By referring back to the condensed sick reports it will be found the diseases diagnosed as malaria first occurred in June, and upon the different sick reports the following figures appear:

June	3
July.....	11
August	103
September.....	203
October.....	205
Total	525

These figures indicate 525 cases of malaria, but as stated above this large number is due to repetition; and there were only 273 individuals whose diseases were diagnosed as malaria. These are distributed among the different companies as follow:

Company A.....	22	Company I.....	18
Company B.....	25	Company K.....	25
Company C.....	21	Company L.....	30
Company D.....	22	Company M.....	27
Company E.....	24	Staff	5
Company F.....	18		
Company G.....	18	Total.....	273
Company H.....	18		

Of the 273 individuals said to have had malaria, 66 were sick only a few days, and their diseases would have been more properly designated as febriculæ. Most of the others were sick for one month or longer, and were undoubtedly cases of typhoid fever.

Of the 207 cases of protracted malaria or "continued malarial fever," 148 were still sick when the last report was made, October 31, 1898. This leaves 59 completed cases of malaria, among which there are reported 12 deaths. A death rate of more than 20 per cent in "mild remittent malarial fever" is, to say the least, unexpectedly high.

Of the 207 cases of "continued malarial fever" (typhoid fever diagnosed as malaria), 156 appear for the first time on sick report when they became ill with typhoid fever; in other words, 156 of the cases of typhoid fever were not preceded by any indisposition—at least so far as the records show.

Those individuals who had typhoid fever and whose names had previously appeared on sick report afford material for some interesting studies. Indeed, we regard this of sufficient importance to justify us in giving a complete list of the cases of "continued malaria," which was preceded by some other illness:

No. 1. Indigestion, August 24 to 25; malaria, August 31 to October 8.

No. 2. Diarrhea, August 16 to 17; malaria, September 20 to October 8.

No. 3. Indigestion, September 11 to 13; malaria, September 24; died October 8.

No. 4. Diarrhea, September 5 to 6; malaria, September 10; still sick October 31.

No. 5. Indigestion, September 4 to 8; indigestion, September 15 to 16; malaria, September 20; still sick October 31.

No. 6. Diarrhea, August 14 to 15; malaria, August 18 to October 19.

No. 7. Continued fever, September 7 to 9; malaria, September 10 to 11; continued fever, September 26; still sick October 31.

No. 8. Continued fever, August 12 to 16; malaria, August 19 to September 21.

No. 9. Diarrhea, August 22 to 23; malaria, August 25 to October 25.

No. 10. Diarrhea, August 13 to 16; malaria, August 18; still sick October 31.

No. 11. Indigestion, September 15 to 16; continued fever, September 24; still sick October 31.

No. 12. Diarrhea, August 12 to 13; malaria, August 19 to September 21.

No. 13. Indigestion, August 5 to 6; malaria, August 18 to October 28.

No. 14. Diarrhea, September 13 to 14; indigestion, October 14 to 16; continued fever, October 18; still sick October 31.

No. 15. Indigestion, August 16 to 17; malaria, August 17 to September 23.

No. 16. Diarrhea, August 14 to 16; malaria, August 18 to September 21.

No. 17. Diarrhea, September 6 to 7; malaria, September 12; died September 22.

No. 18. Indigestion, August 22 to 27; malaria, August 29; still sick October 31.

No. 19. Diarrhea, September 2 to 3; malaria, September 5; still sick October 31.

No. 20. Remittent malaria, September 6 to 8; continued fever, September 10; still sick October 31.

No. 21. Indigestion, September 9 to 11; malaria, September 14; still sick October 31.

No. 22. Diarrhea, September 14 to 16; continued fever, September 19; still sick October 31.

No. 23. Diarrhea, August 20 to 21; malaria, August 29 to September 1; malaria, September 2 to 3; malaria, September 5 to 6; continued fever, September 29; still sick October 31.

No. 24. Diarrhea, September 21 to 22; indigestion, September 30 to October 3; continued fever, October 6; still sick October 31.

No. 25. Diarrhea, August 8 to 9; diarrhea, August 13 to 14; malaria, August 20 to October 31.

No. 26. Indigestion, August 19 to 21; continued fever, August 29 to October 24.

No. 27. Diarrhea, August 4 to 5; diarrhea, August 7 to 8; malaria, August 19; still sick October 31.

No. 28. Diarrhea, September 12 to 14; malaria, September 15 to 17; continued fever, September 19; still sick October 31.

No. 29. Indigestion, September 15 to 16; continued fever, September 25; still sick October 31.

No. 30. Simple fever, July 14 to 22; diarrhea, August 2 to 3; continued fever, October 21; still sick October 31.

No. 31. Malaria, August 13 to 14; malaria, August 19 to September 21.

No. 32. Indigestion, August 21 to 22; malaria, August 29; still sick October 31.

No. 33. Simple fever, August 9 to 21; malaria, August 26 to September 30.

No. 34. Diarrhea, August 21 to 22; continued fever, August 29 to September 24.

No. 35. Diarrhea, August 13 to 14; malaria, August 29 to September 25.

No. 36. Diarrhea, August 14 to 15; diarrhea, August 17 to 18; malaria, August 29; still sick October 31.

No. 37. Simple fever, August 12 to 15; diarrhea, August 20 to 24; malaria, August 29; still sick October 31.

No. 38. Malaria, September 10 to 11; indigestion, September 14 to 16; malaria, September 16; still sick October 31.

No. 39. Indigestion, September 10 to 11; malaria, September 12; still sick October 31.

No. 40. Diarrhea, September 10 to 12; continued fever, September 14; still sick October 31.

No. 41. Indigestion, September 11 to 13; indigestion, September 14 to 15; malaria, September 16; still sick October 31.

No. 42. Malaria, September 16 to 18; continued fever, September 23; still sick October 31.

No. 43. Indigestion, October 7 to 12; continued fever, October 18; still sick October 31.

No. 44. Diarrhea, August 13 to 14; malaria, August 29 to October 25.

No. 45. Indigestion, August 4 to 5; malaria, September 13; still sick October 31.

No. 46. Indigestion, September 29 to October 1; continued fever, October 8; still sick October 31.

No. 47. Indigestion, September 11 to 12; malaria, October 15; still sick October 31.

No. 48. Indigestion, August 27 to 29; continued fever, September 29 to October 6.

No. 49. Indigestion, August 2 to 3; malaria, August 18; still sick October 31.

No. 50. Indigestion, September 16 to 17; continued fever, September 20; still sick October 31.

No. 51. Diarrhea, September 21 to 22; continued fever, September 29; still sick October 31.

In our opinion the preceding disease was really a part of the typhoid fever in all of these cases, with the exception of Nos. 2, 14, 23, 30, 45, 47, and 48. Therefore, we think that with the exception of these cases, all others should be included in the list of those who do not appear on sick report until they developed typhoid fever.

We may make the following summary concerning malaria in this regiment:

(1) Two hundred and seventy-three individuals were reported with malaria. Sixty-six of these were cases of some mild indisposition, and would have been more properly designated as febriculæ. Two hundred and seven were undoubtedly cases of typhoid fever.

(2) Of the 207 cases of typhoid fever diagnosed as "continued malaria," 156 first appeared on sick report when attacked by this disease. Forty-four other cases were so closely preceded by some indisposition that such preliminary indisposition must, in our opinion, be regarded as a part of the typhoid fever. Looking at it in this way, we may say that out of 207 of the cases of typhoid fever diagnosed as malaria, 200 were not preceded by any other illness.

The reported "diarrheas" for the entire period from May 18 to October 31 are distributed among the companies as follows:

Company A.....	9	Company H.....	17
Company B.....	16	Company I.....	21
Company C.....	11	Company K.....	10
Company D.....	16	Company L.....	9
Company E.....	25	Company M.....	12
Company F.....	14		
Company G.....	23	Total.....	183

Of these 183 cases of diarrhea, 9 present a subsequent history of such a character as to justify us in believing that they were cases of typhoid fever. There is no

hospital record concerning 7 of these protracted diarrheas. In one case the diagnosis of chronic diarrhea is continued on the hospital register, and in the ninth case the diagnosis was changed in the hospital to typhoid fever. Deducting these 9 cases, there remain 174 cases of diarrhea on the regimental report. Five individuals were reported as having had three attacks, and 15 as having had two attacks of diarrhea. This reduces the number of individuals reported with diarrhea to 149.

It may be of interest to endeavor to ascertain if there be any relation between the diarrheas and the long-continued malarial fevers. With this in view, we will give a list of those names found to have had both diarrhea and protracted malaria.

No. 1. Diarrhea, September 5 to 6; malaria, September 10; still sick October 31.

No. 2. Diarrhea, August 14 to 15; malaria, August 18 to October 19.

No. 3. Diarrhea, August 13 to 16; malaria, August 18; still sick October 31.

No. 4. Diarrhea, August 12 to 16; malaria, August 19 to September 21.

No. 5. Diarrhea, August 20 to 21; malaria, October 2; still sick October 31.

No. 6. Diarrhea, September 13 to 14; malaria, October 18; still sick October 31.

No. 7. Diarrhea, August 14 to 15; malaria, August 18 to September 21.

No. 8. Diarrhea, August 20 to 21; malaria, August 29; still sick October 31.

No. 9. Diarrhea, September 2 to 3; malaria, September 5; still sick October 31.

No. 10. Diarrhea, September 14 to 16; malaria, September 19; still sick October 31.

No. 11. Diarrhea, September 21 to 22; malaria, October 6; still sick October 31.

No. 12. Diarrhea, August 4 to 5; diarrhea, August 7 to 8; malaria, August 19; still sick October 31.

No. 13. Diarrhea, August 8 to 9; diarrhea, August 13 to 14; malaria, August 20 to October 21.

No. 14. Diarrhea, August 17 to 18; malaria, August 29 to September 24.

No. 15. Diarrhea, August 14 to 15; diarrhea, August 17 to 18; malaria, August 29; still sick October 31.

No. 16. Simple fever, August 12 to 15; diarrhea, August 20 to 24; malaria, August 29; still sick October 31.

No. 17. Diarrhea, August 13 to 14; malaria, August 29 to October 25.

These are the only cases of diarrhea that were followed by the so-called "continued malarial fever." We are strongly of the opinion that all of these were real cases of typhoid fever, and that in the majority of them the preliminary diarrhea was a part of the typhoidal process. This is not supposed to be possible in cases Nos. 5 and 6. It is believed to be probable in Nos. 11, 12, 13, 14, 15, and 17, and quite certain in all others. If this supposition be correct, may it not be possible that many of the short diarrheas were due to typhoid infection and that the bacilli in these failed to multiply sufficiently to produce a fully developed form of typhoid fever, and that the disease in this aborted form may give immunity to typhoid fever for

a short period? We will return to these questions after having collected more data bearing on them.

Deducting the 17 individuals mentioned above from the total of 149 who had diarrhea, there remain 132 persons reported with diarrhea, none of whom subsequently had typhoid fever or any other form of continued fever.

We may make the following summary concerning diarrhea in this regiment:

(1) Of the 183 cases reported, 9 were probably cases of typhoid fever. In the remaining 174 cases 149 individuals were involved. Of these 149 individuals, 17 subsequently developed typhoid fever; and in 15 of these cases the typhoid fever followed so closely upon the diarrhea that the latter is believed to have been a part of the former.

(2) Of the 149 individuals who had diarrhea, 132 had subsequently neither typhoid fever nor any other form of "continued fever."

We now turn to the cases diagnosed as "indigestion." These are distributed among the companies as follows:

Company A	25	Company H	15
Company B	10	Company I	14
Company C	10	Company K	21
Company D	12	Company L	15
Company E	12	Company M	20
Company F	18		
Company G	18	Total	190

Of these 190 cases, 24 were of such a duration as to lead us to believe that they were really cases of typhoid fever. These cases are as follows:

- No. 1. Indigestion, August 29; still sick October 23.
- No. 2. Indigestion, August 3 to October 25.
- No. 3. Indigestion, September 15; furloughed September 26.
- No. 4. Indigestion, June 26; sent to division hospital July 2. Here the disease was diagnosed as typhoid fever, and the man was furloughed July 27.
- No. 5. Indigestion, August 29 to October 23.
- No. 6. Indigestion, August 26; sent to Sternberg Hospital on the same date. Here the disease was diagnosed as typhoid fever. This patient was still sick October 31.
- No. 7. Indigestion, September 8; sent to division hospital on same date. Here the disease was diagnosed as typhoid fever and the patient furloughed September 26.
- No. 8. Indigestion, June 23 to September 12.
- No. 9. Indigestion, August 29 to September 25.
- No. 10. Indigestion, August 29 to September 26.
- No. 11. Indigestion, August 29 to September 25.
- No. 12. Indigestion, September 3; still sick October 31.
- No. 13. Indigestion, September 8; sent to division hospital on the same date. Here the disease was diagnosed as typhoid fever, and the patient was furloughed November 8.
- No. 14. Indigestion, July 6; sent to division hospital July 13. Here the disease was diagnosed as typhoid fever, and the name does not appear on any of the subsequent sick reports.
- No. 15. Indigestion, August 29 to September 25.
- No. 16. Indigestion, August 24; sent to division hospital August 26. Here the case was diagnosed as typhoid fever, and the patient died August 30.
- No. 17. Indigestion, August 29 to September 25.
- No. 18. Indigestion, August 29 to October 25.
- No. 19. Indigestion, August 31; still sick October 31.
- No. 20. Indigestion, August 29; still sick October 31.

- No. 21. Indigestion, August 29 to September 25.
- No. 22. Indigestion, August 29; still sick October 31.
- No. 23. Indigestion, August 29; still sick October 31.
- No. 24. Indigestion, August 29; died September 13.

Of these 24 cases, 9 were still sick when the October report was closed, leaving 13 completed cases. Two of these died, giving a mortality of 15.46 per cent. Even if we supposed that all of the cases left incomplete in the report ended in recovery 2 deaths in 24 cases of typhoid fever is not an exceptionally low mortality.

We will now attempt a study of the relation between the indigestions and the continued malarías by giving a list of those who are recorded as having suffered from both:

- No. 1. Indigestion, August 24 to 25; malaria, August 31 to October 8.
- No. 2. Malaria, August 11 to September 8; indigestion, September 9 to 11.
- No. 3. Indigestion, September 11 to 13; malaria, September 24; died October 2.
- No. 4. Indigestion, September 15 to 16; malaria, September 20; still sick October 31.
- No. 5. Malaria, August 19 to September 21; indigestion, October 2 to 4.
- No. 6. Indigestion, September 10 to 11; malaria, September 26; still sick October 31.
- No. 7. Indigestion, September 15 to 16; malaria, September 24; still sick October 31.
- No. 8. Indigestion, October 15 to 16; malaria, October 18; still sick October 31.
- No. 9. Indigestion, August 16 to 17; malaria, August 17 to September 23.
- No. 10. Indigestion, August 23 to 27; malaria, August 29; still sick October 31.
- No. 11. Indigestion, September 30 to October 6; malaria, October 6; still sick October 31.
- No. 12. Indigestion, August 19 to 24; malaria, August 29 to October 24.
- No. 13. Indigestion, September 15 to 16; malaria, September 25; still sick October 31.
- No. 14. Indigestion, August 17 to 22; malaria, August 22 to September 21.
- No. 15. Indigestion, September 10 to 11; malaria, September 16; still sick October 31.
- No. 16. Indigestion, September 11 to 16; malaria, September 16; still sick October 31.
- No. 17. Indigestion, September 16 to 18; malaria, September 23; still sick October 31.
- No. 18. Indigestion, October 7 to 12; malaria, October 18; still sick October 31.
- No. 19. Indigestion, August 2 to 3; malaria, August 13; still sick October 31.

These cases show that the so-called "indigestions" were frequently a prelude—more rarely a sequel, as in case No. 2—to typhoid fever.

There is another class of indigestions, of which the following is an example:

Indigestion, July 11 to 21; indigestion, July 23 to August 1; indigestion, August 4 to 5; indigestion, August 5 to 6; indigestion, August 7 to 9; indigestion, August 16 to 19.

It will be seen that this man was on the sick report almost continuously from July 11 to August 19. It is

highly probable that this was a case of intermittent typhoid fever. However, we have not included it in our estimate of the number of cases of typhoid fever in the regiment.

In order to gain further information if possible concerning the nature of the disease or diseases designated as "indigestions" in this regiment, we give herewith a list of all cases of indigestion and a statement of the subsequent history of each so far as the records give us information:

- No. 1. Indigestion, June 26 to October 28.
- No. 2. Indigestion, June 26 to September 12.
- No. 3. Indigestion, June 29; duty, July 4; diarrhea, July 14; discharged August 8.
- No. 4. Indigestion, July 6; quarters, July 23; diarrhea, August 13 and 14; malaria, August 17 to 21.
- No. 5. Indigestion, July 10; duty, July 18.
- No. 6. Indigestion, July 10 to 12; indigestion, July 14; furloughed August 23.
- No. 7. Indigestion, July 11; sent to quarters July 22; indigestion, July 23 to August 1; indigestion, August 4 to 6; indigestion, August 7 to 9; indigestion, August 16 to 19; malaria, August 29 to September 25. This man was in division hospital from July 11 to 22. Here his disease was diagnosed as "gastro-enteritis." He was sent to quarters July 22. The next day he reported at sick call and remained on the sick list until August 1, when he was marked "duty." Three days later he appears on the sick list for two days, and then off and on at intervals of a few days until August 29, when he is again recorded as suffering from indigestion, and this time he remained off duty for nearly one month or until September 25.
- No. 8. Indigestion, July 14 to 16.
- No. 9. Indigestion, July 15 to 17; malaria, August 29 to October 23.
- No. 10. Indigestion, July 20 to 22.
- No. 11. Indigestion, July 26 to 28.
- No. 12. Indigestion, July 30 and 31; indigestion, September 6 to 9; indigestion, September 13 to 18.
- No. 13. Indigestion, August 2 and 3.
- No. 14. Indigestion, August 3 to 15; indigestion, August 29 to October 25.
- No. 15. Indigestion, August 4 and 5; malaria, September 13; still sick October 31.
- No. 16. Indigestion, August 5 and 6; malaria, August 18 to October 28. This man was sent to Sternberg Hospital August 20, and there the disease was diagnosed as typhoid fever.
- No. 17. Indigestion, August 5 and 6.
- No. 18. Indigestion, August 14 to 16.
- No. 19. Indigestion, August 15 and 16.
- No. 20. Indigestion, August 16 and 17; malaria, August 17 to September 23.
- No. 21. Indigestion, August 16 to 18.
- No. 22. Indigestion, August 16 to 18.
- No. 23. Indigestion, August 17 to 22; malaria, August 19 to September 21.
- No. 24. Indigestion, August 18 to 20; continued fever, September 7 to 10. This man does not appear on the regimental records again, but from the hospital report we learn that he was sent to division hospital with typhoid fever September 12 and was furloughed October 12.
- No. 25. Indigestion, August 18 to 27; diarrhea, August 29 to September 25; simple fever, August 12 to 15. It will be seen that in this case this man's disease, which in all probability was typhoid fever, had its initial date August 12.
- No. 26. Indigestion, August 18 and 19; diarrhea, September 26 and 27.
- No. 27. Indigestion, August 19 to 21; continued fever, August 29 to September 24.

- No. 28. Indigestion, August 19 to 21; indigestion, August 22 to 24; malaria, August 29 to October 24.
- No. 29. Indigestion, August 20 to 22; malaria, September 19 to 21; malaria, September 22 to October 4.
- No. 30. Indigestion, August 21 and 22; indigestion, August 29 to September 25.
- No. 31. Indigestion, August 21 and 22.
- No. 32. Indigestion, August 23 to 27; malaria, August 29; still sick October 31.
- No. 33. Indigestion, August 23 to 26.
- No. 34. Indigestion, August 24 and 25; malaria, August 31 to October 8.
- No. 35. Indigestion, August 24 and 25; diarrhea, August 21 to 23.
- No. 36. Indigestion, August 24; died August 30.
- No. 37. Indigestion, August 24 and 25; diarrhea, August 22 and 23. This name does not again appear on the regimental record, but in the hospital report it is registered as an admission of October 6, with "intestinal toxæmia." The man was furloughed October 29.
- No. 38. Indigestion, August 24 and 25.
- No. 39. Indigestion, August 25 to 27.
- No. 40. Indigestion, August 25 to 27; malaria, October 7 to 10.
- No. 41. Indigestion, August 25 to 27.
- No. 42. Indigestion, August 26; still sick October 31.
- No. 43. Indigestion, August 27 to 30; malaria, August 18 to 26. It will be seen that this man was sick from August 18 to 30. In all probability this was a mild case of typhoid fever.
- No. 44. Indigestion, August 27 to 30; diarrhea, September 15 and 16.
- No. 45. Indigestion, August 27 to 30; diarrhea, September 5 to 7.
- No. 46. Indigestion, August 27 to 29; malaria, September 21 to October 8.
- No. 47. Indigestion, August 29 to October 24; continued fever, August 12 to 23. It will be seen that this man's illness should date from August 12. Undoubtedly this was a case of typhoid fever.
- No. 48. Indigestion, August 29 to September 25.
- No. 49. Indigestion, August 29 to October 25; continued fever, August 21 to 27. This man's typhoid fever should date from August 21.
- No. 50. Indigestion, August 29 to September 9.
- No. 51. Indigestion, August 29; still sick October 31; diarrhea, August 22 and 23.
- No. 52. Indigestion, August 29 to September 25; diarrhea, August 13 and 14.
- No. 53. Indigestion, August 29; still sick October 31.
- No. 54. Indigestion, August 29; still sick October 31; diarrhea, August 13 to 15.
- No. 55. Indigestion, August 29 to September 26.
- No. 56. Indigestion, August 29; died September 13.
- No. 57. Indigestion, August 29 to September 25.
- No. 58. Indigestion, August 31 to September 4.
- No. 59. Indigestion, August 31; still sick October 31.
- No. 60. Indigestion, September 1 and 2; diarrhea, September 3 and 4.
- No. 61. Indigestion, September 1 to 10; diarrhea, August 14 and 15.
- No. 62. Indigestion, September 2 and 3; malaria, October 5 and 6; malaria, October 19 and 20.
- No. 63. Indigestion, September 2 and 3.
- No. 64. Indigestion, September 3 to 5; diarrhea, September 16 and 17; indigestion, October 20 and 21.
- No. 65. Indigestion, September 3 to 5; diarrhea, September 7 and 8.
- No. 66. Indigestion, September 3 to 6; diarrhea, September 8 and 9; indigestion, September 10 to 12.
- No. 67. Indigestion, September 3 to 5; continued fever, October 26 to 31.
- No. 68. Indigestion, September 4 to 6.

- No. 69. Indigestion, September 4 and 5.
- No. 70. Indigestion, September 4 to 8; indigestion, September 15 and 16. This name does not reappear on the regimental record, but the hospital report shows that he was admitted to the division hospital with "continued malaria," September 20, and was furloughed October 17.
- No. 71. Indigestion, September 5 and 6.
- No. 72. Indigestion, September 6 to 11.
- No. 73. Indigestion, September 7 and 8. This man was sick in the division hospital September 9, where his disease was diagnosed "remittent malaria," and he was furloughed September 24.
- No. 74. Indigestion, September 7 and 8. This man was sent to hospital October 22 with "remittent malaria" and was furloughed November 4.
- No. 75. Indigestion, September 8; still sick October 31.
- No. 76. Indigestion, September 8; still sick October 31.
- No. 77. Indigestion, September 8 to 10.
- No. 78. Indigestion, September 9 to 11; malaria, August 11 to September 8. We infer from this record that this man, in all probability, had typhoid fever extending from August 11 to September 8, and the so-called "indigestion" was a sequel to the typhoid fever.
- No. 79. Indigestion, September 9 to 11; malaria, September 14; still sick October 31.
- No. 80. Indigestion, September 9 and 10.
- No. 81. Indigestion, September 9 to 16.
- No. 82. Indigestion, September 10 to 12; indigestion, September 15 and 16.
- No. 83. Indigestion, September 10 and 11.
- No. 84. Indigestion, September 10 and 11; continued fever, September 7 to 9; malaria, September 26; still sick October 31.
- No. 85. Indigestion, September 10 to 12.
- No. 86. Indigestion, September 10 to 12.
- No. 87. Indigestion, September 10 to 12; malaria, September 17 to 23; continued fever, September 13 to 17. It is quite evident this man's illness extended from September 10 to 23 and that it is probable that this was a mild case of typhoid fever.
- No. 88. Indigestion, September 10 and 11; indigestion, September 14 to 16; malaria, September 16; still sick October 31.
- No. 89. Indigestion, September 10 and 11; malaria, September 20; still sick October 31.
- No. 90. Indigestion, September 10 and 11; diarrhea, September 2 and 3; diarrhea, September 5 and 6.
- No. 91. Indigestion, September 11 to 13; continued fever, September 24; died October 2.
- No. 92. Indigestion, September 11 to 13; indigestion, September 14 and 15; malaria, September 16; still sick October 31.
- No. 93. Indigestion, September 11 and 12; malaria, October 14; still sick October 31.
- No. 94. Indigestion, September 12 to 16; diarrhea, September 21 and 22; diarrhea, September 29 to October 3.
- No. 95. Indigestion, September 12 to 15; malaria, September 16 to 20.
- No. 96. Indigestion, September 13 to 17; malaria, October 18 and 19; diarrhea, September 12 and 13.
- No. 97. Indigestion, September 14 to 16.
- No. 98. Indigestion, September 14 to 18.
- No. 99. Indigestion, September 14 to 16.
- No. 100. Indigestion, September 14 to 18; diarrhea, September 10 to 12.
- No. 101. Indigestion, September 15 and 16; diarrhea, August 13 to 15.
- No. 102. Indigestion, September 15 to 18.
- No. 103. Indigestion, September 15 and 16; malaria, September 24; still sick October 31.
- No. 104. Indigestion, September 15 and 16; malaria, September 17 and 18.
- No. 105. Indigestion, September 15 and 16; malaria, September 24; still sick October 31.
- No. 106. Indigestion, September 15 to 18.
- No. 107. Indigestion, September 15 to 17; continued fever, September 6 to 9.
- No. 108. Indigestion, September 15 and 16.
- No. 109. Indigestion, September 15 to 20.
- No. 110. Indigestion, September 16 to 18; malaria, September 23; still sick October 31.
- No. 111. Indigestion, September 16 and 17; malaria, September 20; still sick October 31.
- No. 112. Indigestion, September 16 to 25.
- No. 113. Indigestion, September 17 and 18; continued fever, October 15; discharged October 24.
- No. 114. Indigestion, September 17 to 22.
- No. 115. Indigestion, September 18 to 21.
- No. 116. Indigestion, September 19 and 20; diarrhea, September 15 to 17.
- No. 117. Indigestion, September 19 and 20.
- No. 118. Indigestion, September 19 and 20; indigestion, September 29 and 30.
- No. 119. Indigestion, September 19 and 20.
- No. 120. Indigestion, September 19 and 20.
- No. 121. Indigestion, September 20 and 21.
- No. 122. Indigestion, September 20 to 22.
- No. 123. Indigestion, September 20 to 22.
- No. 124. Indigestion, September 21 and 22; continued fever, August 12 and 13.
- No. 125. Indigestion, September 21 and 22.
- No. 126. Indigestion, September 21 and 22.
- No. 127. Indigestion, September 21 and 22.
- No. 128. Indigestion, September 21 and 22; indigestion, September 28 to October 1; diarrhea, August 24 to 26; continued fever, August 27 to 29.
- No. 129. Indigestion, September 21 and 22.
- No. 130. Indigestion, September 21 and 22.
- No. 131. Indigestion, September 21 to 23.
- No. 132. Indigestion, September 21 and 22; malaria, September 29; still sick October 31.
- No. 133. Indigestion, September 21 and 22.
- No. 134. Indigestion, September 21 to 24; continued fever, September 25 to 28.
- No. 135. Indigestion, September 22 to 25.
- No. 136. Indigestion, September 24 and 25.
- No. 137. Indigestion, September 24; still sick October 31.
- No. 138. Indigestion, September 24 to 27.
- No. 139. Indigestion, September 24 to 26.
- No. 140. Indigestion, September 25 to 29; diarrhea, September 21 to 23.
- No. 141. Indigestion, September 26 to 29.
- No. 142. Indigestion, September 26 to October 5.
- No. 143. Indigestion, September 26 to 28.
- No. 144. Indigestion, September 27 to October 5.
- No. 145. Indigestion, September 29 to October 1; malaria, October 8; still sick October 31.
- No. 146. Indigestion, September 30 to October 3; diarrhea, September 21 and 22; malaria, October 6; still sick October 31.
- No. 147. Indigestion, September 30 to October 14; diarrhea, August 20 and 21.
- No. 148. Indigestion, October 1 to 3; indigestion, October 4 to 6.
- No. 149. Indigestion, October 1 to 4.
- No. 150. Indigestion, October 2 to 4; malaria, August 29 to September 21. It is evident that this indigestion followed typhoid fever.
- No. 151. Indigestion, October 3 to 6.
- No. 152. Indigestion, October 4 to 8.
- No. 153. Indigestion, October 5 to 8.
- No. 154. Indigestion, October 5 to 7.
- No. 155. Indigestion, October 7 and 8.
- No. 156. Indigestion, October 7 to 12; malaria, October 18; still sick October 31.

No. 157. Indigestion, October 7 to 9; malaria, August 18 to September 25.

No. 158. Indigestion, October 8 to 10.

No. 159. Indigestion, October 9 to 21.

No. 160. Indigestion, October 10 to 16.

No. 161. Indigestion, October 10 to 13.

No. 162. Indigestion, October 10 to 15.

No. 163. Indigestion, October 10 to 13.

No. 164. Indigestion, October 11 and 12.

No. 165. Indigestion, October 11 to 14.

No. 166. Indigestion, October 11 to 14.

No. 167. Indigestion, October 12 to 14.

No. 168. Indigestion, October 12 to 14.

No. 169. Indigestion, October 12 to 15.

No. 170. Indigestion, October 12 to 14.

No. 171. Indigestion, October 12 and 13.

No. 172. Indigestion, October 13 to 14.

No. 173. Indigestion, October 13 and 14.

No. 174. Indigestion, October 13 and 14.

No. 175. Indigestion, October 13 and 14.

No. 176. Indigestion, October 14 to 16.

No. 177. Indigestion, October 15 and 16; diarrhea, September 13 and 14; malaria, October 18; still sick October 31.

No. 178. Indigestion, October 19 and 20.

No. 179. Indigestion, October 19 and 20.

No. 180. Indigestion, October 19 and 20; malaria, September 1 and 2.

No. 181. Indigestion, October 19 and 20.

No. 182. Indigestion, October 20 to 22.

No. 183. Indigestion, October 23 to 31.

With this tabulated information before us, we will attempt to determine the significance of the diagnosis of "indigestion" as used in this regiment. It will be seen that a large proportion of these "indigestions" are not closely associated with any other disease. The number of individuals reported with this form of indigestion is 111, or 60.65 per cent of the total number reported under this diagnosis. Some of these individuals subsequently had the so-called "continued malaria," which was in reality typhoid fever; but the two attacks were so far separated in point of time that we do not believe that one was influenced by the other.

No. 9 is a case of this kind. This man suffered from "indigestion" from July 15 to 17; then returned to duty, and so far as we can learn from the records, remained well until August 29, when he became ill with "continued malaria" and remained sick until October 23.

This kind of indigestion sometimes followed typhoid fever, which is not at all strange. Cases Nos. 150 and 157 are illustrations of this. We have been somewhat surprised to find that only 6.3 per cent of the 111 individuals who had this form of indigestion, subsequently had typhoid fever. We are certainly justified in saying that this form of indigestion did not increase susceptibility to typhoid fever.

The observer will readily pick out cases in the above list in which indigestion was undoubtedly a part of the typhoidal process. These cases number 34 and constitute 18.58 per cent of the total reported "indigestions."

Some of these are of more than passing interest. They illustrate a form of typhoid fever, which we believe to be more prevalent in both civil and military life than is usually supposed. To us these cases indicate that in its earlier stages typhoid fever may, and often is, an inter-

mittent disease. In these cases the intermittent stages of the typhoid fever are not always designated as "indigestion," for the surgeons seemed to have had several names which they apparently used indiscriminately.

In case No. 7 the patient, it seems, had five attacks of "indigestion" before the disease became "continued malarial fever," while No. 20 had scarcely been returned to duty from his first attack of indigestion before the malarial element entered.

In No. 25 it was "simple fever" for the first three days. After an interval of three days more it became "indigestion." This continued for nine days, when the patient had two days rest from disease, when diarrhea came on and proved more powerful than its predecessors, keeping the man off duty for nearly a month.

In No. 28, two attacks of indigestion seemed to have prepared this individual for the malaria, which kept him off duty for nearly two months.

In No. 47, "continued fever" remained for eleven days, and after an interval of six days more, was followed by indigestion, which proved to be much more persistent than the "continued fever."

There are 18 cases in the above list in which the intervals between the "indigestion" and the "continued malaria" are from six to eighteen days. Some interesting questions might be asked concerning these cases. Has the preliminary indisposition any relation to the subsequent typhoid fever? If so, what is this relation? Did the indigestion prepare the body for the specific germ of typhoid fever? Does the indigestion represent the first effects of the typhoid bacillus? If we could answer these questions we might be in a fair way of getting some important information concerning the period of incubation of this disease.

In looking over the above-given list, some noteworthy observations may be made. The "indigestions" reported from June 26 to July 11, inclusive, were evidently more than temporary indispositions. The one of shortest duration (No. 5) continued for eight days. The data concerning No. 41 are not complete, but enough is given to show that the illness continued for some time. This individual reported July 6, and was sent to hospital, where he remained until July 23, when he was sent to quarters. Records leave him sick in quarters until August 13, although one infers that some time between these dates he was returned to duty. However, our general statement that all the "indigestions" reported from June 26 to July 11, inclusive, were more serious and more persistent than the temporary indispositions usually covered by this term, holds good.

Coming to the "indigestions" of August 29 (Nos. 47 to 57, inclusive), we find that all of these are of more than ordinary import. Let us study these cases somewhat more closely. In doing this we find that in all probability August 29 is not the true initial date of some of them.

No. 47 had "continued fever" from August 12 to August 23. The true initial date for Nos. 52 and 54 was

probably August 13. The initial dates to Nos. 49 and 51 seem to have been August 21 and August 22, respectively. There are 2 other cases (Nos. 30 and 31, with initial date of August 21); 1 of these (No. 30) was also followed on August 29 by "indigestion." These 3 cases (Nos. 47, 52, and 54), subsequently developed into typhoid fever, have their initial dates on August 12 and 13, and 3 other cases (Nos. 30, 49, and 51) have their initial dates on August 21 and 22, while all of these, 6 in number, developed typhoid fever August 22. The record does not show that the other cases (48, 50, 53, 55, 56, and 57), 6 in number, that developed typhoid fever August 29, had any preliminary illness.

As has already been stated, this regiment reached Chickamauga May 18, with 1 recognized case of typhoid fever. This patient was kept in the regimental hospital until he died, May 24. According to the testimony of Captain Howe, this patient's excretions were disinfected and buried; and the next typhoid case (however, not diagnosed as such) appeared about the middle of June. Indeed, 3 consecutive cases occurred on the 15th, 16th, and 17th of this month. That of June 15 was diagnosed "gastric fever," and remained off duty until July 3. It is highly probable that this was a mild case of typhoid fever. The case of June 16 was diagnosed as "diarrhea," and the patient was carried to division hospital, where the diagnosis was "continued fever." The last record of this man that we have been able to find is that he was still in hospital August 31.

The case of June 17 was diagnosed "continued fever," and the patient was carried to division hospital, where the diagnosis was changed to typhoid fever. The last record of this man, so far as we have it, is that he was granted sick leave July 18. There can be no doubt that typhoid fever did reappear in this command about the middle of June. For two months after this date the cases of "continued fever" were not numerous. About the middle of August there was an explosive outbreak of the disease.

Besides the cases of typhoid fever that we have already detected in the regimental reports, 40 cases diagnosed as typhoid fever or "continued malaria" appear in the hospital records from this regiment which the regimental records do not mention.

The following is a summary of the cases of typhoid fever in the regiment:

Number of cases diagnosed in the regiment as typhoid fever..	2
Number of cases of protracted fever diagnosed in the regiment as "malaria"	203
Number of cases of protracted fever diagnosed in the regiment as "diarrhea"	9
Number of cases of protracted fever diagnosed in the regiment as "gastritis"	9
Number of cases of protracted fever diagnosed in the regiment as "indigestion"	24
Number of cases without any regimental diagnosis, but found in the hospital records diagnosed as typhoid fever or "continued malarial fever"	43
Total	290

Under the still more indefinite terms of "gastritis," "gastric fever," and "gastric disturbances," 27 cases are reported. Nine of these are believed by us to have been typhoid fever, and are included in our estimate of the number of typhoid cases in the regiment. These cases are as follows:

No. 1. Gastric fever, September 15; sent to division hospital on the same date. Here the disease was diagnosed as typhoid fever, and the patient was furloughed October 24.

No. 2. Gastric fever, September 27; still sick October 31.

No. 3. Gastric fever, September 28 to October 13.

No. 4. Gastric fever, June 15 to July 3.

No. 5. Gastric fever, August 29 to October 23.

No. 6. Gastritis, September 24 to October 3.

No. 7. Gastritis, September 30; still sick October 31.

No. 8. Gastric fever, June 21 to September 28. This man was sent to division hospital and here his disease was diagnosed typhoid fever.

No. 9. Gastric fever, June 20; sent to division hospital July 12. Disease was here diagnosed typhoid fever, and the man was furloughed July 27.

Nine cases were diagnosed as dysentery. One of these appeared on sick report August 13. His disposition is not given and there is no record that he was returned to duty. However, it is altogether likely that his illness was of short duration and that the failure to report his return to duty was due to clerical error.

One case diagnosed as dysentery was sent to Fort Thomas September 23. This man remained at Fort Thomas under the same diagnosis until October 8, when he was furloughed.

The third case of dysentery appeared on the sick report October 26 and was left incomplete October 31. Of the remaining cases of dysentery no one remained off duty longer than twenty-four hours.

SUMMARY.

Assembled at Toledo, Ohio, April 25, 1898.

Went to Columbus, Ohio, April 29, 1898.

Mustered into the United States service May 12, 1898.

Arrived at Chickamauga Park May 18, 1898.

Strength on arrival, 864.

Date of first case of probable typhoid fever, May 18, 1898.

Date of first case of recognized typhoid fever, May 18, 1898.

Left Chickamauga August 27, 1898.

Strength on departure, 1,299.

Number of cases of probable typhoid fever developed at Chickamauga	70
Number of cases of probable typhoid fever developed at Knoxville:	
From August 28 to 31	45
During September	125
During October	41
During November	10

Total number of cases of probable typhoid fever developed in the Sixth Ohio Volunteer Infantry from May to November, 1898

These 291 cases were diagnosed as follows:

Typhoid fever	148
Continued fever	22
Malaria	86
Gastritis	3
Diarrhea	8
Indigestion	18

Enteritis.....	1
Dysentery.....	1
Fever and hemorrhage.....	1
Gastric fever.....	2
Gastralgia.....	1
Total.....	291

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Baumgardner, Frank C.	2d Lt.	1898, Aug. 22	Chattanooga, Tenn.	Typhoid.
Brower, Homer F.....	Pvt., H.	Dec. 2	Camp Poland, Tenn.	Do.
Craig, Frank W.....	Pvt., I.	Oct. 5	Sick at Clyde, Ohio, with typhoid; died October 5, 1898, with a complication of pneumonia.	Do.
Dale, Will W.....	Pvt., D.	Oct. 6	Fostoria, Ohio.....	Do.
Droessler, Frank J.....	Pvt., A.	Oct. 2	Camp Poland, Tenn.	Do.
Edwards, William S.....	Corpl., F.	Aug. 21	Camp Thomas, Ga.....	Enteric fever.
Englehart, William S.....	Pvt., H.	Aug. 26do.....	Typhoid.
Gardner, Joseph.....	Pvt., M.	Oct. 31	Second Division hospital, Second Brigade, First Army Corps.	Do.
Kenson, W. A.....	(?)	Aug. 31	Division hospital.....	Do.
Kindig, Edward.....	Pvt., M.	Aug. 21	Camp Thomas, Ga.....	Fever.
Kistner, Rawson J.....	Pvt., D.	Oct. 10	Camp Poland, Tenn.....	Typhoid.
Rittenhouse, Frank C.....	Pvt., G.	Nov. 26do.....	Cerebral paralysis.
Shetleroe, Slonious.....	Pvt., L.	Sept. 14	Toledo, Ohio.....	Typhoid.
Smith, John H., jr.....	Pvt., H.	June 7	Camp Thomas, Ga.....	Uremia.
Sullinger, Charles W.....	Pvt., E.	Nov. 21	Stryker, Ohio, while on sick leave.	Typhoid.
Terry, Ellis M.....	Pvt., G.	Oct. 30	Camp Poland, Tenn.....	Do.
Waldner, Henry.....	Pvt., E.	Aug. 30	Chickamauga, Ga.....	Do.
Wandtke, Herman.....	Pvt., C.	Sept. 1	Toledo, Ohio.....	Do.
Ward, John A.....	Pvt., I.	Nov. 12	Camp Poland, Tenn.....	Do.
Williams, Samuel S.....	Pvt., G.	May 24	Camp Thomas, Ga.....	Do.
Whethorn, W.....	Pvt., G.	Sept. 7do.....	Do.
Total deaths.....				21
Deaths due to typhoid fever.....				19
Percentage of deaths among cases of probable typhoid fever (291), 6.52.				
Percentage of deaths among recognized cases of typhoid fever (148), 12.83.				

COMMUNICATIONS FROM THE SURGEONS IN THE SIXTH OHIO.

Medical officers.

Park L. Meyers, major and surgeon, Fostoria, Ohio.

John Howe, captain and assistant surgeon, Toledo, Ohio.

Under date of July 17, 1899, Captain Howe furnished us with the following additional information concerning this regiment:

I submit herewith a brief review of the sanitary condition of each camp occupied by the Sixth Ohio Volunteer Infantry:

First. Camp Bushnell, Columbus, Ohio. The general lay of the ground occupied by this regiment at Camp Bushnell was poorly adapted to camping purposes, being not properly drained. Moreover, before our arrival this site had been used by adjoining troops as a general dumping ground, being literally covered with fecal matter. A detail was at once put to work to bury the accumulated filth, and the ground was made as clean as possible under the circumstances. The sinks were at the regulation distance from the camp, and their contents were covered with dirt and lime twice a day. The water supply was the same as that furnished the city of Columbus. The water was used without boiling or filtration.

Second. Camp George H. Thomas, Chickamauga Park, Ga. Our camp site here was very good in every way, except, perhaps, there was an overabundance of shade. The ground was rolling and permitted natural drainage, but we were too much crowded to secure good sanitary conditions. We were separated by a distance of about 100 feet from the One hundred and Fifty-eighth Indiana on one side and by about 200 feet from the First West Virginia

on the opposite side. The sinks of both the Sixth Ohio and the First West Virginia were within the 200 feet of space intervening between these camps. On account of the limited space we were obliged to have battalion instead of company sinks. These sinks were poorly constructed on account of scarcity of lumber. They were boarded up on the back and sides, leaving the front entirely open and the building without any roof. The contents were lined and covered with earth twice a day, but on account of the open condition of the superstructure they were frequently flooded by the heavy rains, and the contents overflowed and polluted the ground for a considerable distance about them. It was impossible to prevent the overflowing of these sinks by ditching, because being without roofs the heavy rains would fill them and cause them to overflow. New sinks could not be dug as often as they should have been on account of the limited space. We could not place our sinks in any other location because we were surrounded on either side by regiments and on the fourth side by the brigade drill grounds. Flies literally swarmed about the sinks, kitchens, and mess tables. Our camp was not moved during our stay of three months at this place, nor were those of the other regiments in our brigade. Our water supply was obtained during the early part of our stay at Chickamauga from adjacent wells. These wells were, however, soon exhausted, and the supply from that time on was hauled in barrels from a spring 5 miles distant which gushed up through the rocks clear and cold and was undoubtedly pure and wholesome, this source being remote from habitations and encampments. Each company was provided with a barrel for the storing of its drinking water. A few of these barrels had spigots near the bottom. In the majority of the cases, however, the men dipped the water from the barrels in cups. In my opinion, this was a means of contaminating the water by contact with unclean hands. Orders for boiling the water could not be carried out on account of the lack of proper utensils. Filters were furnished each company but were of little service. On account of our limited space the tents could not be moved to new ground, but they were lowered about once a week and the ground where they stood was exposed to the sun.

Third. Camp Poland, Knoxville, Tenn. As you made a personal inspection of our camp at Knoxville you are familiar with the sanitary conditions at that place. This was a great improvement over our former camps, especially in the arrangement and care of sinks. The "cat" system was inaugurated at Camp Poland.

Fourth. Camp in Cuba. Here our camp was located about 2½ miles from Cienfuegos. From a sanitary standpoint the location was a most excellent one. There was good surface drainage. The water was obtained from an artesian well and was always boiled. As there was unlimited room the sinks were located fully 150 yards from the camp. The system of covering individual discharges was rigidly enforced. No cases of typhoid fever developed while in Cuba.

Fifth. Camps on Dafueski Island and at Augusta, Ga. These locations occupied by our regiment on returning from Cuba were in most excellent condition.

FIRST WEST VIRGINIA VOLUNTEER INFANTRY.

Second Brigade, Second Division, First Army Corps.

This regiment assembled at Charleston, W. Va., and encamped on the Kanawha River about 2 miles above the city. The men began to arrive at this place April 26, and the regiment remained here until May 18, when it departed for Chickamauga Park, Ga.

According to the testimony of Major Shafer, the water used at Charleston was obtained from the Kanawha River and was distributed through the camp in barrels. This water was believed to be all right, with the exception of the fact that it was sometimes muddy.

Fecal matter was deposited in pits and was covered with earth once a day. There is no record of sickness in this regiment at Charleston.

This command reached Chickamauga Park May 20 and was brigaded with the Sixth Ohio and the One hundred and fifty-eighth Indiana. This brigade was located near Jay's mill. The site of the regimental camp was in an open wood on a sloping and well-drained knoll. During the first weeks of encampment at this place the drinking water was obtained from wells. The well at Jay's mill first furnished the water. Another well near the southern line of the regimental camp was soon exhausted, the pump broken, and no water was afterwards obtained from this source. A third well was bored within the regimental lines, but after a short time the fear of its being contaminated led the officers to forbid the use of water from this source. After this, and during the greater part of the stay at Chickamauga, drinking water was brought in barrels from Blue Spring, which is located outside the park and some miles from any of the encampments. The location of the brigade was quite distant from the nearest pipes carrying Chickamauga Creek water, and the men of this regiment could have obtained water from this source only at rare intervals when off duty. None of the drill movements brought this regiment near the pipe lines, and the water of Chickamauga Creek must be excluded from the possible sources of the typhoid fever that prevailed in this command.

The fecal matter was deposited in sinks dug on the slope of the knoll above the regiment. On account of the rocky nature of the soil these sinks, according to the testimony of Major Shafer, could not be dug more than 50 inches deep. These pits became very foul, and after heavy rains their contents occasionally overflowed.

The first order issued in this command after its arrival at Chickamauga is the following, dated May 25, 1898:

AN ORDER TO FURTHER PRESERVE THE HEALTH OF THE COMMAND
AND PREVENT THE OCCURRENCE OF INFECTIOUS DISEASES.

Kitchen sinks.—4 by 4 by 6 feet deep. No solid material to be thrown in; only for dish water. Solid refuse to be burned. Once a day kitchen sinks to be covered with 2 or 3 inches of earth.

Company sinks.—At least 2 by 3 feet, excavated to a depth of 8 feet. Once each day the contents of the sink must be covered with 3 inches of soil.

The order providing for the individual covering of feces is said to have originated in this regiment. The following is a copy:

HEADQUARTERS FIRST WEST VIRGINIA VOLUNTEER INFANTRY,
Camp George H. Thomas, July 9, 1898.

Special Orders, No. 16.

Paragraph 1. In order to prevent the transfer of typhoid germs from fecal matter to the food through the agency of flies carrying them on their feet, a shovel will be kept at each sink and every man in camp required to cover his own deposit. Any neglect of this precaution will be promptly reported to the company commander by any man observing the same. Inspection will be made

to see that this order is carried out and, if necessary, a sentinel will be placed at each sink.

Paragraph 2. All members of the regiment are cautioned against using the water from Jay's mill pump or springs in the vicinity of the camp for any purposes without first boiling the same.

SPILLMAN, *Colonel.*

VANCE, *Lieutenant and Acting Adjutant.*

As has already been stated, the rocky nature of the soil prevented the digging of sinks to the depth demanded in the order. However, these orders show that the officers of this regiment were fully alive to the dangers of the spreading of infection, and a special interest attaches to the study of the progress of typhoid fever in this command. It may be very properly asked how nearly were the above-given orders carried out.

This command was inspected by our board after its transfer to Knoxville. At this place the site was excellent, and the character of the soil did not possess the objectionable features of that at Chickamauga. It is only fair to preface the following statement by saying that at the time of our inspection the regimental surgeon, Major Baguley, had been for some weeks detached from the regiment and was then in charge of the division hospital, and the colonel was absent on sick leave. The following is an abstract from our stenographic notes on inspecting this command:

Sinks.—Floor at one found to be dirty and covered with flies; fecal matter badly exposed. It was said that this sink was used by the corral men. A sentry stated that the fecal matter was covered three times a day. A man using the fourth sink said that the soldiers covered each individual deposit. Taken altogether, the sinks are in fair condition compared with other sinks at Knoxville.

This regiment remained at Chickamauga until August 26, when it was moved to Knoxville.

In the report for May, Major Baguley makes the following statement:

The sanitary condition of the regimental camp is good. The prevailing diseases are diarrhea and dysentery, the sequelæ to acute gastritis, and due to indiscretions in diet. Six hundred and six cases of diarrhea, dysentery, vaccinia, and other minor disabilities were treated during the period covered by this report, a large percent of the vaccinations being primary.

Evidently the mild cases referred to in the above quotation from the regimental surgeon were not included in the May report.

CONDENSED SICK REPORT FROM MAY 18 TO MAY 31, INCLUSIVE.

Mean strength	1,011
Gastritis	7
Indigestion	5
Other diseases	20
Total	32

In the June report Captain Gilham, then in charge, makes the following statement:

The sanitary condition of the regimental camp has been good. Jay's mill well at north side of camp is susceptible of being contaminated. The use of this water has been prohibited. The prevailing diseases are diarrhea and gastro-enteritis, caused by indiscretions in diet.

CONDENSED SICK REPORT FOR JUNE.

Mean strength	1,167
Gastritis	4
Indigestion	127
Gastro-enteritis	12
Diarrhea	27
Dysentery	49
Simple continued fever	17
Typhoid fever (?)	2
Other diseases	126
Total	364

In the July report, also made by Captain Gilham, we find the following:

The health of the command has been good. The sanitary conditions of the camp are good.

CONDENSED SICK REPORT FOR JULY.

Mean strength	1,320
Typhoid fever	7
Simple continued fever	19
Indigestion	43
Gastro-enteritis	17
Diarrhea	22
Dysentery	7
Gastritis	2
Enteritis	1
Other diseases	104
Total	222

It will be observed that, although the mean strength is 153 more than that for June, the total sickness is less by 142. Comparatively this is a good showing.

In the August report Lieutenant Nesbitt, surgeon in charge, makes the following statement:

The condition of camp from a sanitary standpoint is good. The prevailing disease is malaria, many cases of this disease having developed since the command left Chickamauga Park.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength	1,169
Typhoid fever	3
Simple continued fever	9
Remittent malaria	108
Diarrhea	80
Indigestion	101
Dysentery	6
Gastro-enteritis	6
Gastritis	1
Undiagnosed fever	1
Other diseases	131
Total	446

It will be seen that the total number of sick in August is twice as great as it was in July, and that malaria, which was not reported at all in June and July, is now represented by 108 cases. The cases of recognized typhoid fever are decreased to less than half, and as 2 of these reported in August are brought over from July, the actual number of cases developed in this command is reduced to 1. If this report could be accepted as true, the condition of the command, so far as typhoid fever is concerned, would be most satisfactory. We will return to a consideration of this point later.

In the September report Lieutenant Nesbitt, surgeon in charge, states as follows:

The prevailing diseases are malaria and gastro-enteric catarrh. Location of camp is excellent and the general health of the command is rapidly improving. Typhoid fever is gradually disappearing.

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength	1,281
Typhoid and suspects	25
Diarrhea	67
Indigestion	94
Dysentery	5
Gastritis	74
Gastro-enteritis	29
Remittent malaria	168
Simple continued fever	3
Other diseases	118
Total	583

The surgeon in charge seems to have been without warrant in making the statement in this report that "typhoid fever is gradually disappearing."

We fail to find justification for this statement in his own report, inasmuch as he registered 3 cases of typhoid fever in August and 25 in September. Likewise the statement is not fulfilled in the October report, for in that he recognizes 26 cases of typhoid fever.

In the October report Lieutenant Nesbitt states:

The condition of this command is very much improved. The prevailing causes of sickness have been malarial and venereal infections. The men of this regiment are at this time in excellent physical condition. Patients furloughed from division hospital are carried on this report as sick in division hospital.

CONDENSED SICK REPORT FOR OCTOBER.

Mean strength	1,254
Typhoid fever	26
Remittent malaria	75
Diarrhea	36
Gastro-enteritis	19
Gastritis	40
Indigestion	66
Dysentery	2
Gastric catarrh	3
Other diseases (largely venereal and jaundice)	219
Total	486

We will now enter upon a critical study of the diseases covered by these reports. In the first place, we will take up the intestinal disorders.

The terms "indigestion," "diarrhea," "dysentery," "gastritis," and "gastro-enteritis" seem to have been used indiscriminately. In order to get an opinion of the nature of the diseases covered by these diagnoses we will give a complete list of all the cases in this regiment covered by these diagnoses.

Company A.

- No. 1. Indigestion, June 1 and 2.
- No. 2. Indigestion, June 1 to 3; diarrhea, July 1 to 4; malaria, September 14 and 15; gastritis, September 30 and October 7.
- No. 3. Indigestion, June 2 to 9.

No. 4. Dysentery, June 3 to 6; malaria, September 1; sick, October 31. The last illness of this man was probably typhoid fever.

No. 5. Indigestion, June 5 to 9.

No. 6. Indigestion, June 5 to 8; malaria, September 1 to 14; the last illness in this case was probably mild typhoid fever.

No. 7. Dysentery, June 6 to 9; gastritis, September 20 to 23.

No. 8. Indigestion, June 6 to 9; diarrhea, June 16 to 18; continued fever, June 23 to July 13. This was a case of typhoid fever.

No. 9. Indigestion, June 6 to 9.

No. 10. Indigestion, June 6 to 9; alcoholic gastritis, October 3 to 8.

No. 11. Indigestion, June 7 to 10; dysentery, August 31 to September 1.

No. 12. Gastro-enteritis, June 7 to 10.

No. 13. Dysentery, June 9 to 15; indigestion, June 25 to 27.

No. 14. Indigestion, June 12 to 17.

No. 15. Indigestion, June 12 to 17; dysentery, August 15 to 19.

No. 16. Indigestion, June 14 to 16.

No. 17. Indigestion, June 16 to 18; diarrhea, August 12 to 24. The last illness in this case may have been typhoid fever.

No. 18. Indigestion, June 16 to 20.

No. 19. Indigestion, June 17 to 20; gastritis, July 12 to 14; indigestion, September 29 to October 5.

No. 20. Indigestion, June 18 to 20.

No. 21. Indigestion, June 18 to 20.

No. 22. Indigestion, June 20 to 22.

No. 23. Indigestion, June 20 to 22.

No. 24. Indigestion, June 22 to 30.

No. 25. Indigestion, June 23 to 27.

No. 26. Indigestion, June 25 to 27.

No. 27. Indigestion, June 25 to 27.

No. 28. Indigestion, June 25 to 27.

No. 29. Indigestion, June 29 to July 2.

No. 30. Indigestion, July 1 and 2.

No. 31. Indigestion, July 1 to 3.

No. 32. Alcoholic gastritis, July 7 to 13.

No. 33. Indigestion, July 12 and 13.

No. 34. Indigestion, July 16 to 18.

No. 35. Diarrhea, July 29 and 30; diarrhea, September 1 and 2.

No. 36. Diarrhea, August 4 to 7.

No. 37. Indigestion, August 6 to 10; gastritis, October 4 to 6.

No. 38. Diarrhea, August 12 to 22.

No. 39. Diarrhea, August 12 to 14; diarrhea, September 28 and 29.

No. 40. Diarrhea, August 16 and 17; gastritis, September 9 to 11.

No. 41. Indigestion, August 21 to 23; typhoid fever September 20; sent to division hospital September 23.

No. 42. Diarrhea, August 24 to 26; indigestion, August 30 and 31.

No. 43. Diarrhea, August 29 and 30.

No. 44. Indigestion, August 30 and 31.

No. 45. Gastritis, August 23; sent to division hospital September 2.

No. 46. Indigestion, August 30; sent to division hospital August 31; furloughed, September 21.

No. 47. Diarrhea, September 1 and 2.

No. 48. Indigestion, September 2 to 4; diarrhea, September 2 to 5.

No. 49. Indigestion, September 3 to 5.

No. 50. Gastritis, September 9 to 11; gastro-enteritis, September 25 to October 2.

No. 51. Gastro-enteritis, September 12 to 27; gastritis, September 28 to October 16.

No. 52. Indigestion, September 13 and 14.

No. 53. Gastritis, September 14 to 16.

No. 54. Gastritis, September 14 to 16; indigestion, October 5 and 6; gastro-enteritis, October 8; sent to division hospital October 8. This proved to be a case of typhoid fever.

No. 55. Indigestion, September 14 to 16; indigestion, September 19 and 20.

No. 56. Indigestion, September 17 and 18.

No. 57. Gastritis, September 18 to 21.

No. 58. Gastro-enteritis, September 24 to October 9. This might have been a case of typhoid fever.

No. 59. Gastro-enteritis, September 25; no disposition is given in this case.

No. 60. Diarrhea, October 10 to 13.

No. 61. Diarrhea, October 12 and 13.

No. 62. Indigestion, October 13 to 15.

No. 63. Indigestion, October 17 to 19.

No. 64. Indigestion, October 20 and 21.

Company B.

No. 1. Gastritis, May 19 to 22; indigestion, September 23 and 24.

No. 2. Indigestion, June 3 to 6; indigestion, July 13 and 14; gastro-enteritis, September 30 to October 3.

No. 3. Dysentery, June 5 to 10.

No. 4. Diarrhea, June 7 to 10.

No. 5. Diarrhea, June 7 to 10.

No. 6. Dysentery, June 7 to 11.

No. 7. Indigestion, June 10 to 12; dysentery, September 19; sent to division hospital September 20; still sick October 31.

No. 8. Dysentery, June 11 to 15; dysentery, July 13 to 19; malaria, September 7 to 9.

No. 9. Indigestion, June 13 to 18; indigestion, June 18 to 21; indigestion, June 25 to 30; malaria, August 25; sent to division hospital September 2; furloughed September 9. This was a case of typhoid fever.

No. 10. Indigestion, June 13 to 16; indigestion, September 26 to 28.

No. 11. Dysentery, June 14 to 16; diarrhea, August 25 to 27.

No. 12. Dysentery, June 14 to 16; malaria, October 6; furloughed November 8. This was a case of typhoid fever.

No. 13. Dysentery, June 14 to 17.

No. 14. Indigestion, June 17 to 20; malaria, August 28 to September 2; malaria, September 12 to 30. This was probably a case of typhoid fever.

No. 15. Indigestion, June 16 to 19; indigestion, August 15 to 17; malaria, September 19 to 24; diarrhea, September 28; sent to division hospital October 11; furloughed October 29.

No. 16. Dysentery, June 17 to 20; malaria, August 21 to 23; malaria, September 2; sent to division hospital September 4; returned to quarters September 11; returned to division hospital September 16; still sick October 31.

No. 17. Dysentery, June 18 to 21; malaria, September 19 to 26; gastritis, September 27 to October 1.

No. 18. Dysentery, June 18 to 20; indigestion, September 23 and 24; gastritis, October 3 to 11.

No. 19. Dysentery, June 18 to 20; indigestion, September 29 to October 12.

No. 20. Indigestion, June 19 to 22; diarrhea, August 26 to 30; gastro-enteritis, September 20 to 25.

No. 21. Dysentery, June 19 to 23.

No. 22. Indigestion, June 22 to 24; typhoid fever, July 11 to August 11.

No. 23. Dysentery, June 23 to 26; malaria, August 31 to September 2; malaria, October 13; still sick October 31.

No. 24. Indigestion, June 24 to 26.

No. 25. Indigestion, June 24 to 28; indigestion, August 18 and 19.

No. 26. Indigestion, June 26 to 28.

No. 27. Diarrhea, July 4 to 7; indigestion, August 3 and 4.

No. 28. Indigestion, July 6 to 9.

No. 29. Gastro-enteritis, July 7 to 13.

No. 30. Indigestion, July 8 to 10; diarrhea, August 10 to 14.

No. 31. Diarrhea, July 11 and 12.

No. 32. Diarrhea, July 12 and 13.

No. 33. Diarrhea, July 21 to 23; malaria, August 26; sent to division hospital, September 21; returned to sick quarters, October 14; returned to duty October 20.

No. 34. Diarrhea, August 11 to 24.

- No. 35. Indigestion, August 12 to 15; malaria, September 6 and 7.
 No. 36. Diarrhea, August 12 to 15; malaria, August 30; sent to division hospital, September 1; returned to duty October 20.
 No. 37. Indigestion, August 14 to 19.
 No. 38. Diarrhea, August 15 and 16; gastritis, September 7 to 9.
 No. 39. Indigestion, August 16 to 19.
 No. 40. Indigestion, August 24 and 25.
 No. 41. Diarrhea, August 26 to 28.
 No. 42. Diarrhea, August 9 to September 1.
 No. 43. Indigestion, September 3 and 4; indigestion, September 22 and 23; indigestion, October 12 to 14; indigestion, October 22 and 23.
 No. 44. Indigestion, September 14 to 16.
 No. 45. Diarrhea, September 29 and 30.
 No. 46. Gastritis, September 18; sent to division hospital September 29; here the disease was diagnosed typhoid fever.
 No. 47. Gastro-enteritis, September 24. The disposition of this patient is not given.
 No. 48. Gastritis, October 1 to 15; indigestion, October 17 to 21.
 No. 49. Diarrhea, October 6 to 8.
 No. 50. Diarrhea, October 6 to 8.
 No. 51. Indigestion, October 6 and 7.
 No. 52. Gastro-enteritis, October 9 to 14.
 No. 53. Gastritis, October 9 to 11.
 No. 54. Gastritis, October 10 to 13.
 No. 55. Indigestion, October 13 to 16.
 No. 56. Diarrhea, October 17 to 19.
 No. 57. Gastritis, October 19 and 20.

Company C.

- No. 1. Gastritis, May 23 to 25; gastric catarrh, October 27; still sick October 31.
 No. 2. Gastritis, May 23 to 25; indigestion, June 4 to 6.
 No. 3. Gastritis, May 29 to June 1.
 No. 4. Gastritis, May 30 to June 3.
 No. 5. Gastritis, September 11 to 13.
 No. 6. Gastritis, May 30 to June 3.
 No. 7. Indigestion, May 29 to June 3; malaria, September 9 to 14.
 No. 8. Indigestion, June 3 to 7; indigestion, June 17 to 19.
 No. 9. Indigestion, June 8 to 13; indigestion, July 11 and 12; indigestion, August 12 to 14.
 No. 10. Indigestion, June 8 to 12; malaria, August 13 to 20; gastritis, September 30 to October 10.
 No. 11. Indigestion, June 20 to 22.
 No. 12. Dysentery, June 20 to 30; diarrhea, July 6 to 9; indigestion, July 11 to 13.
 No. 13. Dysentery, June 23 to 26; malaria, August 16 to 20.
 No. 14. Indigestion, June 23 to 27; diarrhea, October 11 to 13.
 No. 15. Dysentery, June 23 to 29; diarrhea, July 1 to 4.
 No. 16. Indigestion, June 24 to 30; diarrhea, August 10 to 14.
 No. 17. Diarrhea, August 28 to 30.
 No. 18. Gastro-enteritis, June 22 to July 30.
 No. 19. Gastro-enteritis, June 27; sent to division hospital June 29; sent to sick quarters July 6; returned to duty July 7; diarrhea, August 15 to 19.
 No. 20. Gastro-enteritis, June 27 to July 9; malaria, August 8 to 13; diarrhea, September 18 to 19.
 No. 21. Indigestion, July 3 to 5; malaria, September 9 to 14.
 No. 22. Indigestion, July 2 to 4; diarrhea, August 11 and 12.
 No. 23. Indigestion, August 3 and 4; diarrhea, September 2 to 4; gastritis, September 15 to 18; diarrhea, October 6 and 7; indigestion, October 10 and 11.
 No. 24. Indigestion, August 5 to 11.
 No. 25. Indigestion, August 11 to 14.
 No. 26. Indigestion, August 17 and 18; typhoid fever, September 18 to October 30.
 No. 27. Indigestion, August 19 to 23.

- No. 28. Diarrhea, August 31; sent to division hospital September 3; returned to duty October 30.
 No. 29. Diarrhea, August 31; sent to division hospital September 12; returned to duty October 12.
 No. 30. Diarrhea, September 7 to 10.
 No. 31. Indigestion, September 11 and 12; diarrhea, October 13 and 14.
 No. 32. Gastritis, September 4 to 17.
 No. 33. Indigestion, September 15 to 17.
 No. 34. Indigestion, September 18 and 19.
 No. 35. Gastro-enteritis, September 19 to 25; gastritis, October 1; sent to division hospital October 4; sick October 31.
 No. 36. Gastritis, October 1 to 10.
 No. 37. Indigestion, October 6 to 9.
 No. 38. Indigestion, October 20 and 21.
 No. 39. Gastric catarrh, October 27. No disposition given.
 No. 40. Diarrhea, June 29. No disposition given, but from the reports it would appear that this man continued sick to July 31.

Company D.

- No. 1. Indigestion, June 3 to 7; typhoid fever, June 20; furloughed, July 27; indigestion, October 13 to 20.
 No. 2. Indigestion, June 9 and 10; dysentery, June 23 to 25; indigestion, August 11 and 12; dysentery, August 19; sent to division hospital August 25; here the disease was diagnosed typhoid fever and the patient was furloughed September 1.
 No. 3. Dysentery, June 10 to 12.
 No. 4. Indigestion, June 13 to 17.

 No. 50. Diarrhea, October 6 to 8.
 No. 51. Diarrhea, October 28 and 29.
 No. 52. Indigestion, October 30.

We will now proceed to make a few comments on the cases included in the above lists. In order to render reference more easy we will refer to these cases by companies. In the list from Company A the possible cases of typhoid fever are Nos. 4, 6, 8, 17, 38, 41, 45, 46, 51, 54, and 58—11 in all. In cases 38, 45, 46, 51, and 58—if these were cases of typhoid fever—there was no intestinal disorder preceding the typhoid fever. This reduces the number of possible typhoids preceded by intestinal disturbances to 6. Altogether there were 23 probable typhoid cases in this company, and our conclusion, reached in the study of other regiments, that the majority of typhoid fevers were not preceded by intestinal disorders, is again confirmed. The same result may be stated in the following way:

We will suppose that the company had its full quota, 106 men. Fifty-nine of these had some intestinal disorder, which was followed by typhoid fever in 6 individuals, while the 47 men who are not reported as having suffered from any intestinal disorder furnished 18 cases of typhoid fever. In the case of No. 8 the preceding intestinal disorders were most probably developed after the date of the typhoid-fever infection, and should be considered as really a part of the typhoid fever.

In the list from Company B, Nos. 7, 9, 12, 14, 15, 16, 19, 22, 23, 33, 36, and 46—12 in all—were probable cases of typhoid fever. In No. 46 the typhoid fever was not preceded by any intestinal disorder.

Altogether there were in this company 25 cases of probable typhoid fever. Suppose that this company had its full strength, 106 men, then 56 men who had some preceding intestinal disorder developed 11 cases of typhoid fever, and 50 men who had no preceding intestinal disorder developed 14 cases of typhoid fever.

In the list from Company C cases Nos. 10, 18, 19, 20, 26, 28, 29, 35, and 40—9 in all—are possible cases of typhoid fever. In cases Nos. 18, 19, 20, 28, 29, 35, and 40 there were no preceding intestinal disorders. This leaves only two cases that were preceded by recorded intestinal trouble. Altogether there were 24 probable typhoid cases in Company C, therefore two of the cases of typhoid fever were preceded by some intestinal disorder, while 22 cases were not.

In the list from Company D, Nos. 1, 2, 6, 35, 44, and 51—6 in all—were probable cases of typhoid fever. In Nos. 35 and 51 there was no preceding intestinal trouble; in No. 44 the preceding indigestion was most likely a part of the typhoid fever. In No. 1 this was probably the case. This leaves in all 2 cases (Nos. 2 and 6) in which typhoid fever was preceded by some intestinal disorder. Altogether in Company D there were 22 cases of probable typhoid fever in all, 2 of which were preceded by some intestinal disorder.

In Company E, cases Nos. 5, 10, 39, and 42—4 in all—were probable typhoids. In No. 42 there was no preceding intestinal disorder. Altogether there were in Company E 14 cases of probable typhoid fever. Three of these were preceded by some recorded intestinal disorder and 11 were not.

In the list from Company F, Nos. 9 and 37 are the only probable cases of typhoid fever. In No. 37 there was no preceding intestinal disorder. Altogether there were in Company F 12 cases of probable typhoid fever. Only one of these was preceded by some intestinal disorder.

In Company G, cases Nos. 2, 18, 27, 38, 42, and 45—6 in all—were possibly typhoids. Only one of these (No. 18) was preceded by a recognized intestinal disturbance. Altogether there were 25 cases of probable typhoid fever in this company, and only 1 of these was preceded by any intestinal disorder.

In Company H, cases Nos. 15, 25, 30, 32—4 in all—were probable typhoids. Nos. 15 and 30 were not preceded by any intestinal disorder. Altogether there were 16 cases of probable typhoids in this company, and only 2 of these were preceded by a recorded intestinal disease.

In Company I, cases Nos. 12, 13, 18, 24, 25, 30, 36, 38, 42, 47, and 49—11 in all—were probable typhoids. Nos. 24, 25, 36, 38, 42, 47, and 49, were not preceded by any intestinal diseases. Altogether there were 27 cases of probable typhoid fever in this company, and only 4 of these were preceded by recorded intestinal disorder.

In the list from Company K, cases Nos. 16, 25, 28, and 38—4 in all—are probable typhoids. Nos. 16, 28, and 38 were not preceded by intestinal diseases. Altogether there were 25 probable typhoids in this company, only 1 of which was preceded by any recognized intestinal disturbances.

In the list from Company L, cases Nos. 2, 14, 19, 21, 23, 37, and 39—7 in all—were probable typhoids. Nos. 2 and 39 were not preceded by any recorded intestinal disorder. In Nos. 23 and 37 the preceding intestinal diseases were most likely a part of the typhoidal process. This reduces the number of typhoid cases preceded by intestinal disorder in this company to 3. Altogether there were in Company L 26 cases of probable typhoid fever, 23 of which were not preceded by any intestinal disorder.

In the list from Company M, cases Nos. 3, 8, 24, and 38—4 in all—were probable typhoids. No. 38 was not preceded by any intestinal disorder. Altogether there were 12 probable typhoid cases in Company M, and only 3 of these were preceded by recognized intestinal disturbances.

We will now give a general summary for the regiment, so far as the relation between preceding intestinal disorders and typhoid fever is concerned.

There were 260 cases of probable typhoid fever in this regiment. Five of these had the initial date of their illness in November, and 4 others do not belong to any company. Deducting these, the 12 companies furnish 251 cases of typhoid fever.

Supposing that each company had its full quota of 106 enlisted men and 3 commissioned officers; then 1,308 men furnished 251 cases of typhoid fever. Five hundred and eighty-five individuals are reported as having had some intestinal disorder, and apparently 723 escaped diseases of this kind. The 585 persons furnished 82 cases of typhoid fever—1 to 7.13. The 723 individuals furnished 169 cases of typhoid fever—1 to 4.6. However, these figures do not represent the facts. Of the 82 cases of typhoid fever, 42 were not preceded by any intestinal disorder; therefore, 543 persons who had intestinal disorders of some kind, furnished 40 cases of typhoid fever—1 to 13.7; and 765 persons, who had no intestinal disorders, furnished 211 cases of typhoid fever—1 to 3.64. A little more than 84 per cent of the typhoid fevers in this regiment were not preceded by any intestinal disorder. It seems to us that only one conclusion can be drawn from these facts. Many of the diarrheas must have been due to or, at least, accompanied by a typhoidal infection.

The diagnosis of malaria does not occur in the sick reports from this regiment until the month of August. During this month 108 cases are recorded as malaria. This disease is always designated in these reports as remittent. The following is a complete list of the malarias reported in this regiment:

Company A.

- No. 1. Malaria, August 10 to 16.
- No. 2. Malaria, August 16; sent to division hospital August 19; sent to Sternberg Hospital August 27; sick October 31.
- No. 3. Malaria, August 18 to 20.
- No. 4. Malaria, August 19 to 21; malaria, September 7; sent to division hospital September 11; furloughed October 15.
- No. 5. Malaria, August 23 to 25.
- No. 6. Malaria, July 31 to October 15.
- No. 7. Malaria, September 1 to 14.
- No. 8. Malaria, September 4 to 28.
- No. 9. Malaria, September 7 to 17.
- No. 10. Malaria, September 17 to 21.
- No. 11. Malaria, September 1; sent to division hospital September 12; here the disease was diagnosed typhoid fever.

Company B.

- No. 1. Malaria, August 11 to 22.
- No. 2. Malaria, August 18 to 21.
- No. 3. Malaria, August 23 to 28; malaria, August 11; furloughed August 25; hospital diagnosis, typhoid fever.
- No. 4. Malaria, August 17; furloughed August 25; hospital diagnosis, typhoid fever.
- No. 5. Malaria, August 30; sent to division hospital September 1; hospital diagnosis, typhoid fever.
- No. 6. Malaria, October 25; sent to division hospital October 24; sick October 31.
- No. 7. Malaria, September 17 and 18.

Company C.

- No. 1. Malaria, September 2 to 13.
- No. 2. Malaria, September 2 to 17.
- No. 3. Malaria, September 2 to 12.
- No. 4. Malaria, September 3 to 9.
- No. 5. Malaria, September 5 to 14.
- No. 6. Malaria, September 19 to 25.
- No. 7. Malaria, September 5; sent to division hospital September 11. This was a relapse, the initial day of typhoid being July 9.
- No. 8. Malaria, September 12; sent to division hospital September 15; duty, October 7.
- No. 9. Malaria, September 12; sent to division hospital September 12; hospital diagnosis, typhoid fever.
- No. 10. Malaria, August 8; sent to division hospital August 10; returned to duty October 1.
- No. 11. Malaria, September 5; sent to division hospital September 9; discharged October 15.
- No. 12. Malaria, September 29 to October 2.
- No. 13. Malaria, September 6; sent to division hospital September 9; furloughed November 8.
- No. 14. Malaria, August 6; sent to division hospital September 11; this was a relapse; initial date of typhoid was July 2.
- No. 15. Malaria, September 14; sent to division hospital September 15; hospital diagnosis, typhoid fever.
- No. 16. Malaria, September 15; sent to division hospital September 19; hospital diagnosis, typhoid fever.
- No. 17. Malaria, September 15; sent to division hospital September 17; hospital diagnosis, typhoid fever.

Company D.

- No. 1. Malaria, August 11; sent to division hospital August 19; sent to Sternberg Hospital August 25.
- No. 2. Malaria, August 14 to 16.
- No. 3. Malaria, August 18 to 25.
- No. 4. Malaria, August 23 and 24.

No. 5. Malaria, August 24 to 28.

- No. 6. Malaria, August 8; sent to division hospital August 10; furloughed August 25; hospital diagnosis, typhoid fever.
- No. 7. Malaria, August 31 to September 1.
- No. 8. Malaria, September 4 to 14.
- No. 9. Malaria, September 1 to 5.
- No. 10. Malaria, September 5 to 16.
- No. 11. Malaria, September 6 to 22.
- No. 12. Malaria, September 14 to 21.
- No. 13. Malaria, September 14 to 20.
- No. 14. Malaria, September 18 and 19.

Company E.

- No. 1. Malaria, August 11; sent to division hospital August 19; sent to Sternberg Hospital August 25.
- No. 2. Malaria, August 13 to 18.
- No. 3. Malaria, August 22 to 28.
- No. 4. Malaria, August 22 to 29.
- No. 5. Malaria, August 24 to 28.
- No. 6. Malaria, August 25 to 28.
- No. 7. Malaria, August 26 and 27.
- No. 8. Malaria, August 28; sent to division hospital August 30; returned to duty September 19.
- No. 9. Malaria, August 28 to September 9.
- No. 10. Malaria, September 7 to 10.
- No. 11. Malaria, September 16 to 20.
- No. 12. Malaria, September 17 and 18.
- No. 13. Malaria, September 3; sent to division hospital September 9.
- No. 14. Malaria, September 3; division hospital September 11; diagnosis, typhoid fever.

Company F.

- No. 1. Malaria, August 4 to 11; malaria, August 12 to 18.
- No. 2. Malaria, August 12 to 18.
- No. 3. Malaria, August 22 to 25.
- No. 4. Malaria, August 23; sent to Sternberg Hospital August 25; hospital diagnosis, typhoid fever; furloughed, October 14.
- No. 5. Malaria, August 25 to 28; malaria, September 3 to 12.
- No. 6. Malaria, August 24 to 28.
- No. 7. Malaria, August 24 to 26.
- No. 8. Malaria, September 1 to 12.
- No. 9. Malaria, September 6 to 14.
- No. 10. Malaria, September 11 to 16.
- No. 11. Malaria, September 14 to 25.
- No. 12. Malaria, September 15 to 17.
- No. 13. Malaria, September 7; sent to division hospital September 11; hospital diagnosis, typhoid fever; furloughed October 14.
- No. 14. Malaria, October 18 and 19.

Company G.

- No. 1. Malaria, August 23; sent to Sternberg Hospital August 25; furloughed October 9.
- No. 2. Malaria, August 24 to 28; malaria, September 6 to 10.
- No. 3. Malaria, August 16; furloughed August 27; duty October 19.
- No. 4. Malaria, August 22; furloughed September 27.
- No. 5. Malaria, August 24 to September 4.
- No. 6. Malaria, August 31 to September 13.
- No. 7. Malaria, September 6 to 10; malaria, September 13 to 18.
- No. 8. Malaria, September 22 to 25.
- No. 9. Malaria, September 28 to October 19.
- No. 10. Malaria, September 7; sent to division hospital September 11; hospital diagnosis, typhoid fever; furloughed October 17.

Company H.

- No. 1. Malaria, August 12 to 20.
- No. 2. Malaria, August 14; sent to division hospital August 18; sent to Sternberg Hospital August 25; hospital diagnosis, typhoid fever.
- No. 3. Malaria, August 29; sent to division hospital August 31; returned to sick quarters September 14; returned to duty September 18.
- No. 4. Malaria, September 3 to 9.
- No. 5. Malaria, September 9 to 17.
- No. 6. Malaria, September 11 to 16.
- No. 7. Malaria, September 13 to 24.
- No. 8. Malaria, September 13 to 21.
- No. 9. Malaria, August 1; sent to division hospital August 5; returned to sick quarters August 14; returned to duty October 13.
- No. 10. Malaria, August 31; sent to division hospital September 6.
- No. 11. Malaria, September 16; sent to division hospital September 20; hospital diagnosis, typhoid fever.

Company I.

- No. 1. Malaria, August 16; sent to division hospital August 18; sent to Sternberg Hospital August 25; died September 6.
- No. 2. Malaria, August 17; sent to division hospital August 18; sent to Sternberg Hospital August 25; furloughed September 9.
- No. 3. Malaria, August 20 to 23; malaria, September 11 to 16; malaria, September 30 to October 7.
- No. 4. Malaria, August 23 to 28; malaria, September 10 to 18.
- No. 5. Malaria, August 16 to September 26.
- No. 6. Malaria, August 24 to October 10.
- No. 7. Malaria, August 29 to September 3.
- No. 8. Malaria, August 30; sent to division hospital September 12.
- No. 9. Malaria, September 2 to 4; malaria, September 10. Sent to division hospital September 15; returned to duty October 21.
- No. 10. Malaria, September 3; sent to division hospital September 13; returned to duty September 20.
- No. 11. Malaria, September 13 to 25.
- No. 12. Malaria, September 19 to 21; malaria, September 22 to 25.
- No. 13. Malaria, July 31; furloughed August 21; returned to sick quarters September 28.
- No. 14. Malaria, September 2; sent to division hospital September 8; hospital diagnosis, typhoid fever.
- No. 15. Malaria, September 8; sent to division hospital September 11; hospital diagnosis, typhoid fever.
- No. 16. Malaria, September 13; sent to division hospital September 15; hospital diagnosis, typhoid fever.
- No. 17. Malaria, September 17; sent to division hospital September 19; sick October 31.

Company K.

- No. 1. Malaria, August 9 to 19.
- No. 2. Malaria, August 15 and 16.
- No. 3. Malaria, August 24 to 29; malaria, September 12 to 17.
- No. 4. Malaria, August 24; sent to Sternberg Hospital August 25; furloughed September 14.
- No. 5. Malaria, August 25 to 31.
- No. 6. Malaria, August 25 to 30.
- No. 7. Malaria, August 27 to September 16.
- No. 8. Malaria, August 30 to September 30.
- No. 9. Malaria, September 2 to 14.
- No. 10. Malaria, September 14; returned to sick quarters September 26; returned to duty October 10.
- No. 11. Malaria, September 4; sent to division hospital September 5; returned to duty September 26.

- No. 12. Malaria, September 5; sent to division hospital September 12; hospital diagnosis, typhoid fever.
- No. 13. Malaria, September 6; sent to division hospital September 17; hospital diagnosis, typhoid fever.
- No. 14. Malaria, September 10; sent to division hospital September 17; hospital diagnosis, typhoid fever.
- No. 15. Malaria, September 28; sent to division hospital October 25; hospital diagnosis, typhoid fever.
- No. 16. Malaria, September 19; sent to division hospital September 20; duty October 12.
- No. 17. Malaria, October 6; sent to division hospital October 7; hospital diagnosis, typhoid fever.
- No. 18. Malaria, October 9; sent to division hospital October 9; hospital diagnosis, typhoid fever.

Company L.

- No. 1. Malaria, October 2 to 15.
- No. 2. Malaria, August 15 and 16; malaria, September 2 to 4.
- No. 3. Malaria, August 17 to 29.
- No. 4. Malaria, August 17 to 23.
- No. 5. Malaria, August 17 to 23; malaria again, August 24, with no disposition.
- No. 6. Malaria, August 17 to 19.
- No. 7. Malaria, August 23; sent to Sternberg Hospital August 25; furloughed September 17.
- No. 8. Malaria, August 26 to 28.
- No. 9. Malaria, August 11; sent to division hospital August 15; returned to duty September 23.
- No. 10. Malaria, August 22; sent to division hospital August 31; hospital diagnosis, typhoid fever.
- No. 11. Malaria, August 25; sent to division hospital August 31; hospital diagnosis, typhoid fever.
- No. 12. Malaria, September 7; sent to division hospital September 15; returned to duty October 26.
- No. 13. Malaria, September 14; sent to division hospital September 19; hospital diagnosis, typhoid fever.
- No. 14. Malaria, September 19; furloughed October 15.
- No. 15. Malaria, September 28; sent to division hospital October 7; sick October 31.
- No. 16. Malaria, October 10; sent to division hospital October 10; sick October 31.

Company M.

- No. 1. Malaria, August 15; sent to division hospital August 17; sent to Sternberg Hospital August 25; furloughed September 5.
- No. 2. Malaria, August 15 to 21.
- No. 3. Malaria, August 20 to 22.
- No. 4. Malaria, August 24 to 28; malaria, August 30 to September 4.
- No. 5. Malaria, August 12 to September 4.
- No. 6. Malaria, August 30; no disposition.
- No. 7. Malaria, August 31 to September 27.
- No. 8. Malaria, September 8 to 16.
- No. 9. Malaria, September 23 to 27.
- No. 10. Malaria, September 3; sent to division hospital September 5; hospital diagnosis, typhoid fever.
- No. 11. Malaria, September 7; sent to division hospital September 11; furloughed October 17.
- No. 12. Malaria, September 11; sent to division hospital September 14; hospital diagnosis, typhoid fever.

Ninety-three of the above cases were probable typhoids. To this number we must add 26 cases of protracted malaria which were preceded by some intestinal disorder and which are not included in the above list. This gives 119 cases that were diagnosed

by the regimental surgeon as malaria, and whose subsequent history rendered it highly probable that they were cases of typhoid fever.

The following is a summary of the figures concerning typhoid fever in this regiment:

Total number of cases tabulated	260
Number with regimental diagnosis of typhoid fever.....	26
Number with regimental diagnosis of malaria.....	119
Number otherwise diagnosed:	
Diarrhea.....	16
Indigestion	11
Continued fever.....	14
Gastritis or gastro-enteritis.....	29
Dysentery	5
Jaundice.....	1
Number without regimental diagnosis.....	39
Total	260
Number with either regimental or hospital diagnosis of typhoid fever	106
Number with neither regimental nor hospital diagnosis of typhoid fever	154
Total	260

Our tabulated statement shows at least 70 cases of typhoid fever that had their beginning in August. The surgeon's report for this month gives only 3 cases of typhoid fever, and 2 of these were brought over from July. This reduces the number originating in August to 1. The hospital record shows 24 cases of recognized typhoid fever the initial dates of which occur in the month of August. We therefore have three quite diverse statements concerning the number of typhoid fever cases developed in the First West Virginia Infantry during the month of August. The surgeon in charge gives this number as 1. The hospital record places it at 24, and our review of the histories of the sick places it at more than 70. The surgeon in charge of the hospital states that many of the cases reported as malaria in the hospital record were in fact typhoid fever. On September 15 this regiment had 112 patients in the second division hospital and 90 sick in quarters. At that time our committee visited this hospital and the members of our board were satisfied after examining the patients that practically all of them were suffering from typhoid fever. During the same month Professor Dock, well known as an expert diagnostician, studied the cases in this hospital and came to the conclusion that the so-called malarias were typhoid fevers. He examined the blood of 14 of those diagnosed as malaria and failed to find the plasmodium in any of them. These facts convince us that typhoid fever prevailed in this command much more extensively than the figures of the surgeon in charge of the hospital records would indicate. Indeed there are strong reasons that our own estimate is too small. Many men were furloughed home soon after appearing on sick report. Others were furloughed from the division hospital after being there

only a day or two. How many of these men furloughed home early in their illness were really suffering from typhoid fever we can not know.

The distribution of typhoid fever among the companies of this regiment is of interest. Four of the 260 tabulated did not belong to any company. The remaining 256 were distributed among the 12 companies, as follows:

	Cases.		Cases.
Company A	23	Company H	16
Company B	25	Company I	27
Company C	24	Company K	25
Company D	22	Company L	30
Company E	15	Company M	12
Company F	12		
Company G	25	Total.....	256

It will be seen that the distribution among the companies is quite unequal. In our opinion this inequality is sufficiently great to indicate that the spread of the disease could not have been due to causes to which the several companies were simultaneously subjected, but rather to causes that acted upon individuals most intimately associated. The distribution among the companies renders it highly improbable that the general water supply (with the exception of Jay's mill well) of this regiment was at any time infected with typhoid germs. This conclusion is supported by the history of the water supply at the different encampments occupied by this command during the period covered by these reports. We have already considered the water supply at Charleston and at Chickamauga. In regard to that at Knoxville it is sufficient to say that during the time of the occupation in this locality the regiment was supplied with water that was being used simultaneously by several thousand inhabitants of the city, and the health officer of Knoxville assured us, by an inspection of his reports, that typhoid fever did not exist among the citizens at that time. The distribution of the disease in point of time in the several companies confirms our opinion that men living in most direct contact with one another often show the first symptoms of the disease simultaneously. The grouping of cases in some of the companies is quite striking. For instance, the fact that 4 of the 9 cases admitted September 2 belong to Company C is not without significance.

Our study of this regiment practically ends with the month of October; but, as has been stated, 4 cases of typhoid fever are shown by the hospital records to have occurred in November, and it is noteworthy that 3 of these came from the same company and were admitted to the hospital almost simultaneously.

The probabilities are that this regiment became infected at Chickamauga. The first probable case was admitted to sick report June 6, sixteen days after the regiment went in camp at Chickamauga. In our opinion this could hardly have been other than a mild case of typhoid fever, but a diagnosis of indigestion was

made, and the man apparently remained sick in quarters until he was returned to duty July 14. His name is not found on sick report after this date. The records fail to show any suspicious cases earlier than this one.

SUMMARY.

Assembled near Charleston, W. Va., in April, 1898.	
Mustered into United States service about May 10, 1898.	
Arrived at Chickamauga Park, May 20, 1898.	
Strength on arrival, 1,011.	
Date of first case of probable typhoid fever, June 6, 1898.	
Date of first case of recognized typhoid fever, June 16, 1898.	
Left Chickamauga Park, August 26, 1898.	
Strength on departure, 1,298.	
Number of cases of probable typhoid fever developed at Chickamauga	85
Number of cases of probable typhoid fever developed at Knoxville:	
From August 28 to 31	24
During September	122
During October	24
During November	5
Total number of cases of probable typhoid fever reported in the First West Virginia Volunteer Infantry, from May ^a to November, 1898	260
These 260 cases were diagnosed as follows:	
Typhoid fever	106
Malaria	90
Continued fever	12
Gastritis	11
Diarrhea	11
Indigestion	11
Gastro-enteritis	16
Dysentery	3
Total	260

The abatement of typhoid fever during the month of October is much more marked in this command than in some of the other regiments of this division.

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Boyce, Lewellyn K...	Corpl., L	1898, Sept. 20	Camp Poland, Tenn.	Typhoid.
Combes, William H...	(?) I.	Sept. 7	Chickamauga, Sternberg U. S. field hospital.	Do.
Gilliam, William L...	Corpl., G.	Nov. 24	Camp Poland, Tenn.	Obstruction of the bowels.
Henretta, William H.	Pvt., M.	Sept. 20	do	Typhoid.
Irwin, Orison	Pvt., I.	Aug. 2	Camp Thomas, Ga.	Chronic diarrhea.
Long, Thomas B	Corpl., D.	Sept. 14	Camp Poland, Tenn.	Appendicitis.
Mills, George G.	Pvt., B.	Nov. 13	do	Typhoid.
Morgan, John H.	Sgt. maj.	Aug. 29	Camp Thomas, Ga.	Do.
Nickel, Arthur C	Pvt., L.	Sept. 8	Camp Poland, Tenn.	Do.
Reid, James A. G.	Pvt., E.	Oct. 3	do	Do.
Russell, James C	Pvt., F.	Nov. 14	do	Do.
Straight, Homer W.	Pvt., D.	Aug. 6	Camp Thomas, Ga.	Malaria.
Taylor, William J	Pvt., I.	Sept. 5	Deerfield, Mass.	Typhoid.
Toothman, Emery B.	Pvt., G.	Sept. 13	Camp Poland, Tenn., second division hospital.	Do.
Tritipoe, Thomas G.	Sgt., I.	Dec. 22	Berkeley Springs, W. Va.	Consumption.
Total deaths				15
Deaths due to typhoid fever				12
Percentage of deaths among cases of probable typhoid fever (260), 4.61.				
Percentage of deaths among cases of recognized typhoid fever (106), 11.32.				

Corrections by Major Baguley.—Gilliam died of typhoid fever with perforation. Straight died of typhoid fever. Long died of obstruction of bowels and not of appendicitis.

COMMUNICATIONS FROM THE SURGEONS OF THE FIRST WEST VIRGINIA VOLUNTEER INFANTRY.

Medical officers.

Henry B. Baguley, major and surgeon, Wheeling, W. Va.
 Charles T. Nesbitt, first lieutenant and assistant surgeon, Fairmont, W. Va.
 Cassius Hogg, first lieutenant and assistant surgeon, Point Pleasant, W. Va.

The following is abstracted from a communication received from Doctor Nesbitt, under date of July 17, 1899:

The site of the regimental camp at Chickamauga Park was covered with underbrush and weeds and was shaded by a thick growth of young trees. The grounds were immediately cleared and the surface fully exposed. The nature of the soil was such as to interfere with the absorption of moisture, and almost immediately beneath the surface a thick stratum of limestone was found. This made the digging of sinks quite difficult, and dynamite had to be employed. The sinks were 10 feet long, 2 feet wide, and 8 feet deep. Orders were issued that each man should cover his deposit of excrement with dry earth, and this order was rigidly enforced. When the sinks were filled within 2 feet of the top they were covered with earth and abandoned. The kitchen sinks were more troublesome, as the soil would not absorb the water that was constantly poured into them. However, in one or two of these sinks the water and much of the refuse from the kitchen disappeared between the fissures in the limestone rock. The sinks were placed at the end of the company streets and above the camp. Frequently after a heavy rain the sinks would overflow and much of their contents would be carried over the adjacent surface. This was always immediately cleaned up and lime sprinkled over the surface. Lime was always used in the sinks when it could be obtained. The water supply was obtained during the first week of our stay at the park from Jay's mill well. However, a rain storm flooded this well and it was immediately abandoned. After this the water was obtained from a spring located about 4 miles east of the camp and hauled to the camp in barrels. Early in August a well was bored inside our guard line, and water from this was used until it was found that the well was being contaminated by drainage from the sinks. Morsels of bread and kitchen waste were pumped from the well. The nearest sink was 100 feet from the well. This well was abandoned and water was again hauled from the spring, as above mentioned. Up to this time but two cases of typhoid fever had developed in the regiment. Both of these were sent to Leiter Hospital and the correctness of the diagnosis was confirmed by the application of the Widal test.

The location of the camp at Knoxville was ideal. The soil is sandy and there is a natural drainage away from the camp in all directions. Floors for the tents were obtained, and shower baths for the men were constructed. The surface of the ground was kept scrupulously clean. Typhoid fever began to develop almost immediately upon our arrival at Knoxville and the cases became alarmingly numerous and continued to be so during the month of September. Eight deaths from this disease occurred during the third week in September. Every precaution that could be taken was used vigorously. The sinks were kept clean and lime was freely used everywhere. The kitchen refuse was hauled away by the neighboring farmers and used as food for hogs, the barrels being emptied daily. The tents were taken down frequently and the floors taken up. Beds and bedding were frequently aired and

sunned. The men were compelled to keep their persons clean. The kitchens and contents were inspected daily by the surgeons. The cooks were carefully instructed in the art of preparing food, and the food was carefully inspected each day. All sick were promptly transferred to the Second Division hospital. From September 1 until December 23 I was acting surgeon of the regiment and can personally answer for the sanitary condition of the camp during that time. The sinks advised by the investigating committee appointed to look into the sanitary condition of the camps were ordered early in October. I had these constructed as soon as possible, but, in my opinion, they were not a success. The solution of lime contained in the tubs did not retain its antiseptic properties for a sufficient length of time, and the tanks had to be scraped in order to remove the accumulated sediment of lime. The men used large pieces of newspaper and these soon accumulated in sufficient quantity to support fecal matter and expose it to flies.^a We had to clean these tanks six and eight times a day. The use of these sinks was continued, however, until the regiment was moved to Columbus, Ga. Here the water supply was obtained from the city waterworks and was excellent.

The regiment was ordered to Columbus, Ga., during the last week in November. The camp at this place was situated in a cotton field, 2 miles north of the city, upon a slightly elevated space. Ditches were immediately dug for drainage throughout the entire camp. Company streets were graded and drained and the camp placed in the best possible condition. The sinks were prepared when the regiment arrived and were quite complete. The pits were so deep that it was not necessary to dig new ones during our stay there. The kitchen sinks were covered with an iron wire grating that separated all solid material from the fluid. The solids were either burned or carried away by the negroes of the neighborhood. The sinks were deodorized and disinfected frequently by the use of crude petroleum and copperas, which were obtained in liberal quantities. The camp was kept scrupulously clean. Beds and tents were aired and sunned as often as the weather permitted. The corral was cleaned daily; the manure was hauled to the adjoining farms.

During the entire period of service of the First West Virginia Volunteer Infantry the entire camp was carefully inspected by the surgeon every morning and by the officer of the day each evening. The food was carefully inspected each day, and the cooks were instructed in the use of ovens and utensils and in the preparation and cooking of food. The commanding officer, Col. B. L. Spilman, gave every assistance possible in enforcing sanitary regulations, and frequently converted into orders all recommendations of medical officers. Our men became infected with malaria at Chickamauga Park, and at least 40 per cent of them exhibited undeniable symptoms. Malaria is almost unknown in West Virginia, especially in the north and east, among the mountains and foothills, so it is reasonable to think that it was not acquired before entering the army. The disease developed at Chickamauga Park and disappeared almost entirely at Knoxville and Columbus. One case that came from Morgantown, W. Va., I knew before entering the army and demonstrated that he had malaria by examination of the blood. I can furnish you micro-photographs if you desire them. The typhoid epidemic in our regiment undoubtedly proceeded from the contaminated well I spoke of, although I did not make a bacteriological examination of the water, having no facilities. No typhoid fever developed in the regiment until after the water from this well was used, and the majority of the cases developed within twenty days after its use was discontinued. In my opinion, the entire water supply of Chickamauga Park was contaminated in a way similar to that in which the well of which I have spoken was infected. While the superficial layers of earth and stone were in many places almost impervious to water, the deepest strata were full of fissures which admitted surface drainage and excreta from the sinks to the artesian wells from which the men drank. Flies

undoubtedly played an important part in the spread of the infection. During the stay of the regiment at Chickamauga Park I served on the staff of the division hospital, having charge of Ward A from July 10 until August 29. This ward contained 40 beds and was full all the time. Seventy per cent of the cases treated during the month of August were typhoid fever. These cases were transferred to Sternberg Hospital as rapidly as possible, so that in the time during which I was in service many cases were treated. After it could be done with safety, these cases were transferred to Sternberg Hospital as soon as the diagnosis was made; if this was not possible, they were moved as early in convalescence as possible. I had one case of Landry's disease which was fatal within twenty-four hours after the patient presented himself at sick call in his regiment (Fourteenth Minnesota).

In the First West Virginia we had at first an epidemic of diarrhea, with a few cases of dysentery. The diarrhea was attributed largely to indiscretions in diet and change from civil pursuits and habits to outdoor life and exercise, to which the majority of the men were unaccustomed. Malaria and typhoid fever were next encountered, and during the last four months of service venereal diseases were the most important and prevalent pathological condition present.

Major Baguley, who was detached from his regiment from June 4 until late in December, 1898, states that the only case of probable typhoid fever in our report, which began while he was medical officer, is case No. 2. He states that while this might have been a case of typhoid fever there were many cases of diarrhea, gastritis, and gastro-enteritis during the month of June at Chickamauga. He states:

At the division hospital, where the sick of this regiment were received, I do not recall any typhoid cases from this regiment until the latter part of July; and while the general infection which occurred later was attributed by the officers of the regiment to the "third well," drilled within the lines of the regiment, as but few cases developed until after the use of the water from this well, and while it might have been a contributing cause, I am still of the opinion that the epidemic was due to infection of the food of the men by flies.

I am on record, as surgeon in charge of the division hospital, as disapproving the diagnosis of "malarial remittent" in typhoid cases, and do not recall having seen half a dozen cases of malaria during my service in the Army, and my observations at the division hospital lead me to believe that almost without exception cases transferred to the hospital diagnosed malaria were typhoids. However, it must be remembered that these cases as a rule were not under the observation of the regimental surgeon more than twenty-four hours, many of them being transferred to the hospital the same day they reported at sick call.

FIRST PENNSYLVANIA VOLUNTEER INFANTRY.

Third Brigade, Second Division, First Army Corps.

This regiment was mustered into service at Mount Gretna, Pa., May 11, 1898. It reached Chickamauga Park, Ga., May 18.

The May report is signed by Lieut. William Harland, who makes no comments.

CONDENSED SICK REPORT, FROM MAY 11 TO MAY 31, INCLUSIVE.

Mean strength	792
Typhoid fever.....	1
Diarrhea.....	1
Gastro-enteritis.....	2
Other diseases.....	11
Total.....	15

^a It was specified by the board that toilet paper only should be used.

The case of typhoid fever was that of a private in Company B; the initial date of this case was May 12, the day following the date of mustering in. This man was furloughed two days later and apparently reported to his regiment at Chickamauga in August while still ill. He was sent to Sternberg Hospital and was discharged well October 16. However, it is altogether likely that a case of typhoid fever did accompany this regiment to Chickamauga. This was a private in Company I, who reported at sick call May 13, and remained off duty until June 6. The diagnosis in this case was diarrhea. This is not, however, the case of diarrhea which is recognized in the above-given tabular statement of the sickness for the month of May.

The June report is signed by Lieutenant Harland, who makes the following statement:

The health of the regiment is very good. The only illness prevalent is a mild malarial fever, with gastro-enteric symptoms, running a course of about two weeks.

CONDENSED SICK REPORT FOR JUNE.

Mean strength	762
Febricula	2
Malaria	5
Typhoid fever	1
Chronic diarrhea	1
Other diseases	22
Total	31

The case of typhoid fever recognized in this report was that of a corporal in Company G, whose name first appears on sick report May 26, and who died from perforation of the bowels June 3.

The July report bears no comments.

CONDENSED SICK REPORT FOR JULY.

Mean strength	1,078
Typhoid fever	22
Other diseases	13
Total	35

In the August report, Lieutenant Harland makes the following statement:

There have been a number of cases of typhoid fever and malarial fever while in camp at Chickamauga Park. The most rigid sanitary precautions have been continually carried out, and the health of the regiment at the present time is very good.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength	987
Typhoid fever	4
Malarial fever	20
Diarrhea	1
Other diseases	6
Total	31

This regiment left Chickamauga Park, Ga., August 29, and went into camp at Knoxville, Tenn. It remained at Knoxville until September 15, when it departed for Philadelphia. On September 17 the regiment was granted a furlough of thirty days. Many

men were taken sick after the regiment returned to Philadelphia. These, as well as those who were brought by hospital trains, were cared for in the different civil hospitals in Philadelphia and at the homes of the men.

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength	1,055
Dengue fever	28
Typhoid fever	19
Enteritis	4
Diarrhea	1
Malarial fever	12
Other diseases	2
Total	66

In the October report Surgeon Harland makes the following statement:

The men continue to get sick, and are cared for at their several homes or at the civil hospitals. Dengue fever and typhoid fever are the chief diseases. The regiment was mustered out of service October 26, 1898.

CONDENSED SICK REPORT FOR OCTOBER.

Mean strength	1,055
Typhoid fever	109
Dengue fever	15
Malarial fever	7
Dysentery	2
Camp fever	1
Total	134

From these sick reports it would appear that typhoid fever developed in this regiment violently after it returned to Philadelphia. However, this is not the case. The great number of cases of typhoid fever reported in October result from a change in diagnosis of cases that had been carried over from the preceding months. Of the 109 cases of recognized typhoid fever registered in the October report, only 7 originated in October and only 27 developed after the regiment left Knoxville. All others were cases which had been carried over from preceding months, the most of which had been erroneously diagnosed.

The diagnosis of dengue observed in the records of this regiment deserves only a passing comment. That dengue should have prevailed in the First Pennsylvania Volunteer Infantry and should have been absent from all other regiments at Chickamauga Park or at Knoxville, is not even presumable. There can be only one conclusion concerning the report of this disease in this regiment, and that is that the diagnosis was erroneous.

The following is a list of the probable cases of typhoid fever in this regiment:

At Chickamauga, Ga.

No. 1. Company B: Typhoid fever, May 12; furloughed May 14; reported for duty in August, but was still sick with typhoid fever and was sent to Sternberg Hospital August 30. From this hospital the patient was discharged October 16.

No. 2. Company I: Diarrhea, May 13 to June 16.

- No. 3. Company D: Malaria, May 20 to July 15.
- No. 4. Company C: Febricula, May 26 to September 15. In hospital this case was diagnosed malaria and later typhoid fever.
- No. 5. Company G: Typhoid fever, May 26; died June 3.
- No. 6. Company D: Intermittent malaria, May 28; furloughed July 15; returned to duty October 16. In July, the time of furlough, the diagnosis of this case was changed to typhoid fever.
- No. 7. Company I: Malaria, May 30 to June 9.
- No. 8. Company G: Febricula, June 19; furloughed June 29; returned to duty October 16.
- No. 9. Company I: Typhoid fever, July 6; disposition not given.
- No. 10. Company K: Typhoid fever, July 6; disposition not given.
- No. 11. Company A: Typhoid fever, July 11; sent to division hospital July 31; there is no further record of this case.
- No. 12. Company E: Typhoid fever, July 21; sent to division hospital July 31; there is no further record of this case.
- No. 13. Company E: Typhoid fever, July 21; furloughed from Leiter Hospital August 12.
- No. 14. Company C: Typhoid fever, July 22; furloughed from division hospital July 24.
- No. 15. Company E: Typhoid fever, July 23 to October 16.
- No. 16. Company A: Typhoid fever, July 23; furloughed August 18.
- No. 17. Company E: Typhoid fever, July 25; sent to division hospital July 31; there is no further record of this case.
- No. 18. Company K: Typhoid fever, July 25; furloughed July 27.
- No. 19. Company C: Typhoid fever, July 25; furloughed September 15.
- No. 20. Company C: Typhoid fever, July 25; furloughed September 6.
- No. 21. Company E: Typhoid fever, July 29; died August 10.
- No. 22. Company F: Typhoid fever, July 29; sent to division hospital July 31; there is no further record of this case.
- No. 23. Company H: Typhoid fever, July 31; disposition not given.
- No. 24. Company E: Typhoid fever, July 31; disposition not given.
- No. 25. Company H: Typhoid fever, July 31; disposition not given.
- No. 26. Company not given: Typhoid fever, July 31 to October 16.
- No. 27. Company I: Dengue, August 1 to October 16.
- No. 28. Company F: Typhoid fever, August 1; sent to German Hospital September 17.
- No. 29. Company B: Typhoid fever, August 1; died August 27.
- No. 30. Company I: Enteritis, August 1 to September 15.
- No. 31. Company A: Typhoid fever, August 1 to September 15.
- No. 32. Company A: Dengue, August 1 to September 15.
- No. 33. Company H: Dengue, August 1 to September 15.
- No. 34. Company I: Typhoid fever, August 1 to September 15.
- No. 35. Company C: Typhoid fever, August 2 to September 16.
- No. 36. Company C: Typhoid fever, August 2 to October 16.
- No. 37. Company E: Typhoid fever, August 3 to October 16.
- No. 38. Company C: Dengue, August 3; furloughed September 11. After reaching home this case was diagnosed typhoid fever.
- No. 39. Company not given: Dengue, August 3 to September 15.
- No. 40. Company I: Typhoid fever, August 3 to October 16.
- No. 41. Company K: Malaria, August 3 to September 15.
- No. 42. Company D: Typhoid fever, August 4; died August 10.
- No. 43. Company B: Typhoid fever, August 5; furloughed August 19.
- No. 44. Company A: Typhoid fever, August 5; furloughed September 1.
- No. 45. Company E: Typhoid fever, August 8 to October 16.
- No. 46. Company B: Dengue, August 8 to October 16. At home this case was diagnosed typhoid fever.
- No. 47. Company B: Dengue, August 8; furloughed September 11.
- No. 48. Company K: Typhoid fever, August 9; furloughed August 19.
- No. 49. Company C: Dengue, August 9; furloughed August 19.
- No. 50. Company I: Malaria, August 10; furloughed September 15.
- No. 51. Company I: Typhoid fever, August 10 to October 16.
- No. 52. Company K: Malaria, August 10; furloughed August 25.
- No. 53. Company B: Dengue, August 11; furloughed September 15.
- No. 54. Company E: Typhoid fever, August 12 to October 16.
- No. 55. Company B: Typhoid fever, August 12; died August 27.
- No. 56. Company H: Malaria, August 12; furloughed September 15.
- No. 57. Company D: Typhoid fever, August 12; furloughed August 20.
- No. 58. Company G: Typhoid fever, August 12 to October 16.
- No. 59. Company D: Typhoid fever, August 13; furloughed September 6.
- No. 60. Company E: Dengue, August 13 to October 16.
- No. 61. Company C: Dengue, August 13 to September 16.
- No. 62. Company I: Enteritis, August 13; furloughed September 15.
- No. 63. Company B: Dengue, August 13; furloughed September 15.
- No. 64. Company E: Typhoid fever, August 13; furloughed August 19.
- No. 65. Company K: Typhoid fever, August 13 to October 16.
- No. 66. Company K: Malaria, August 15 to September 15. There are several cases which on the records are registered as having reported for duty September 15. In all probability this means that the patients from this regiment in the division hospital who felt able to go home with the regiment obtained permission to leave the hospital on September 15, preparatory to going home with the regiment. It does not mean that these men had recovered.
- No. 67. Company D: Typhoid fever, August 16 to October 16. A point here needs some explanation. It will be seen that there are many cases that reported for duty October 16. This means that the sick from this regiment in Philadelphia who were able to do so reported when the regiment was mustered out. One must not infer from the fact that these men were returned to duty October 16 that they had fully recovered at this time.
- No. 68. Company C: Typhoid fever, August 16 to September 15.
- No. 69. Company B: Typhoid fever, August 16 to September 15.
- No. 70. Company B: Typhoid fever, August 16 to October 16.
- No. 71. Company D: Enteritis, August 16 to September 15.
- No. 72. Company G: Typhoid fever, August 16 to October 16.
- No. 73. Company I: Typhoid fever, August 17 to October 16.
- No. 74. Company A: Typhoid fever, August 17; died October 8.
- No. 75. Company D: Typhoid fever, August 17 to October 16.
- No. 76. Company E: Typhoid fever, August 17 to October 16.
- No. 77. Company I: Typhoid fever, August 17 to September 17.
- No. 78. Company A: Typhoid fever, August 17; died October 4.
- No. 79. Company K: Typhoid fever, August 18 to October 16.
- No. 80. Company C: Malaria, August 18 to October 16.
- No. 81. Company H: Typhoid fever, August 18 to October 16.
- No. 82. Company C: Malaria, August 18 to October 16.
- No. 83. Company E: Typhoid fever, August 18 to October 16.
- No. 84. Company F: Typhoid fever, August 18 to October 16.
- No. 85. Company A: Dengue, August 18 to September 15.
- No. 86. Company K: Typhoid fever, August 18 to October 16.
- No. 87. Company A: Typhoid fever, August 18 to October 16.
- No. 88. Company C: Typhoid fever, August 18; disposition not given.
- No. 89. Company G: Typhoid fever, August 19 to October 16.
- No. 90. Company B: Typhoid fever, August 19 to October 16.
- No. 91. Company B: Typhoid fever, August 19 to October 16.
- No. 92. Company F: Malaria, August 20; furloughed August 31.
- No. 93. Company G: Typhoid fever, August 20 to October 16.
- No. 94. Company H: Typhoid fever, August 20; died September 13.

- No. 95. Company C: Typhoid fever, August 20 to September 15.
 No. 96. Company II: Typhoid fever, August 20 to October 16.
 No. 97. Company F: Typhoid fever, August 20 to October 16.
 No. 98. Company G: Typhoid fever, August 21 to October 8.
 No. 99. Band: Typhoid fever, August 21 to September 15.
 No. 100. Company F: Typhoid fever, August 21; died September 23.
 No. 101. Company D: Typhoid fever, August 21 to October 16.
 No. 102. Company D: Typhoid fever, August 21 to September 15.
 No. 103. Company C: Malaria, August 21; still sick September 30.
 No. 104. Company C: Typhoid fever, August 21 to October 16.
 No. 105. Company K: Typhoid fever, August 22 to October 16.
 No. 106. Company D: Malaria, August 23 to October 16.
 No. 107. Company K: Typhoid fever, August 23 to October 16.
 No. 108. Company K: Typhoid fever, August 23 to September 16.
 No. 109. Company D: Typhoid fever, August 24 to October 16.
 No. 110. Company A: Dengue, August 24 to September 15.
 No. 111. Company not given: Dengue, August 24 to September 15.
 No. 112. Company D: Typhoid fever, August 24 to October 16.
 No. 113. Company E: Typhoid fever, August 25 to October 16.
 No. 114. Company G: Typhoid fever, August 25; sent to University Hospital, in Philadelphia, August 27.
 No. 115. Company D: Typhoid fever, August 25 to October 16.
 No. 116. Company B: Typhoid fever, August 26 to October 16.
 No. 117. Company K: Typhoid fever, August 27 to October 16.
 No. 118. Company B: Typhoid fever, August 27; sent to Episcopal Hospital without date.
 No. 119. Company I: Typhoid fever, August 27 to October 16.
 No. 120. Company I: Dengue, August 27 to October 16.
 No. 121. Company C: Malaria, August 28; sent to Sternberg Hospital August 30; discharged October 16. In hospital this case was diagnosed typhoid fever.
 No. 122. Company A: Malaria, August 28; sent to Sternberg Hospital August 30; furloughed October 21. In hospital this case was diagnosed continued malaria.
 No. 123. Company I: Typhoid fever, August 28; sent to Sternberg Hospital August 30. Here the disease was diagnosed continued malaria, and the patient was furloughed September 12.
 No. 124. Company B: Malaria, August 28; sent to Sternberg Hospital August 30. Here the disease was diagnosed continued malaria, and the patient was discharged October 16.
 No. 125. Company B: Malaria, August 28; sent to Sternberg Hospital August 30. Here the disease was diagnosed continued malaria, and the patient was discharged October 16.
 No. 126. Company F: Malaria, August 28; sent to Sternberg Hospital August 30. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 15.
 No. 127. Company F: Typhoid fever, August 28 to October 16.
 No. 128. Company B: Malaria, August 28; sent to Sternberg Hospital August 30. Here the disease was diagnosed typhoid fever, and the patient was discharged October 16.

At Knoxville, Tenn.

- No. 129. Company B: Malaria, August 30; died in Sternberg Hospital September 8. In hospital this case was diagnosed typhoid fever.
 No. 130. Company G: Typhoid fever, August 30 to October 16.
 No. 131. Company K: Typhoid fever, August 30; still sick in German Hospital October 31.
 No. 132. Company G: Typhoid fever, August 30; sent to division hospital without date.
 No. 133. Company G: Malaria, August 30; sent to division hospital August 30. Here the disease was diagnosed typhoid fever, and the patient was furloughed October 5.
 No. 134. Company D: Malaria, August 30; sent to division hospital August 30. Here the disease was diagnosed typhoid fever, and the patient was furloughed October 10.

No. 135. Company I: Malaria, August 31; sent to division hospital without date. There is no further record of this case, and there is no evidence that this man was ever returned to duty.

- No. 136. Company B: Malaria, August 31 to October 16.
 No. 137. Company D: Malaria, August 31; sent to division hospital without date. There is no further record of this case.
 No. 138. Company B: Typhoid fever, August 31 to October 16.
 No. 139. Company B: Remittent malaria, September 1; still sick September 30.
 No. 140. Company K: Typhoid fever, September 1 to October 16.
 No. 141. Company K: Typhoid fever, September 1 to October 16.
 No. 142. Company I: Typhoid fever, September 1 to October 16.
 No. 143. Company C: Typhoid fever, September 1; still sick in hospital October 31.
 No. 144. Company E: Dysentery, September 1 to November 16. In hospital this case was diagnosed typhoid fever.
 No. 145. Company E: Dengue, September 1 to October 16. In hospital this case was diagnosed typhoid fever.
 No. 146. Company I: Typhoid fever, September 1 to October 17.
 No. 147. Company B: Dengue, September 1; furloughed September 11.
 No. 148. Company K: Malaria, September 1; furloughed September 11.
 No. 149. Company II: Malaria, September 1; furloughed September 15.
 No. 150. Company G: Typhoid fever, September 1 to November 16.
 No. 151. Company D: Malaria, September 1 to October 16. In hospital this case was diagnosed typhoid fever.
 No. 152. Company B: Typhoid fever, September 1 to 15.
 No. 153. Company C: Typhoid fever, September 1; died September 18.
 No. 154. Company K: Dengue, September 1; furloughed September 13.
 No. 155. Company G: Malaria, September 1; furloughed September 15.
 No. 156. Company II: Typhoid fever, September 1; still sick in hospital October 31.
 No. 157. Company K: Typhoid fever, September 1; furloughed September 17.
 No. 158. Company D: Typhoid fever, September 1 to October 16.
 No. 159. Company K: Dengue, September 1; furloughed September 13.
 No. 160. Company H: Typhoid fever, September 1; still sick in Pennsylvania hospital October 31.
 No. 161. Company A: Typhoid fever, September 1, furloughed September 12.
 No. 162. Company B: Typhoid fever, September 1; furloughed September 12.
 No. 163. Company H: Typhoid fever, September 1; furloughed September 9.
 No. 164. Company C: Dengue, September 3; sent to German Hospital September 17.
 No. 165. Company K: Typhoid fever, September 3; returned to duty September 13. Cases of this kind have already been commented upon. As has been stated, men who could possibly leave the hospitals at the time when the regiment departed for Philadelphia asked permission and were allowed to do so. Many of these cases are recorded as "returned to duty." It must not be inferred from this that these men had recovered. On September 12 a hospital train conveyed to Philadelphia all the sick who could bear transportation.
 No. 166. Company D: Typhoid fever, September 3 to October 16.
 No. 167. Company G: Typhoid fever, September 3 to October 16.
 No. 168. Company B: Typhoid fever, September 5; sent to Episcopal Hospital September 17.
 No. 169. Company C: Typhoid fever, September 6; sent to German Hospital without date.

No. 170. Company G: Typhoid fever, September 6; furloughed September 14.

No. 171. Company B: Typhoid fever, September 6 to October 16.

No. 172. Company C: Typhoid fever, September 6; furloughed October 1.

No. 173. Company G: Malaria, September 6; furloughed September 12. At home this case was diagnosed typhoid fever.

No. 174. Company B: Typhoid fever, September 6 to October 16.

No. 175. Company C: Typhoid fever, September 6 to October 18.

No. 176. Company —: Typhoid fever, September 6; furloughed September 12.

No. 177. Company B: Typhoid fever, September 6; furloughed September 12.

No. 178. Company F: Typhoid fever, September 7; furloughed November 12.

No. 179. Company G: Typhoid fever, September 7; furloughed September 12.

No. 180. Company D: Typhoid fever, September 8; sent to University Hospital September 12.

No. 181. Company E: Typhoid fever, September 8; sent to Medico-Chirurgical Hospital September 19.

No. 182. Company C: Typhoid fever, September 8; sent to Methodist Hospital September 12.

No. 183. Company G: Dengue, September 8 to October 16.

No. 184. Company H: Typhoid fever, September 9 to October 16.

No. 185. Company G: Typhoid fever, September 9; sent to Timothy Hospital September 12.

No. 186. Company I: Typhoid fever, September 11; sent to Presbyterian Hospital without date.

No. 187. Company C: Dysentery, September 11 to October 16.

No. 188. Company A: Typhoid fever, September 11; sent to University Hospital September 12.

No. 189. Company B: Malaria, September 12; sent to Methodist Hospital without date.

No. 190. Company C: Dengue, September 12 to October 16.

No. 220. Company D: Typhoid fever, October 10; sent home without date.

No. 221. Company H: Convalescing from typhoid fever, October 16. The initial date of this illness is not given.

No. 222. Company A: Typhoid fever, without date; sent to Methodist Hospital without date.

SUMMARY.

Assembled at Mount Gretna, Pa., April 28, 1898.

Mustered into United States service May 11, 1898.

Arrived at Chickamauga Park, May 18, 1898.

Strength on arrival, 792.

Date of first case of probable typhoid fever, May 12, 1898.

Date of first case of recognized typhoid fever, May 12, 1898.

Left Chickamauga, August 29, 1898.

Strength on departure, 1,071.

Number of cases of probable typhoid fever developed at Chickamauga..... 129

Arrived at Knoxville, Tenn., August 30, 1898.

Left Knoxville, September 15, 1898.

Number of cases of probable typhoid fever developed at Knoxville..... 66

Arrived at Philadelphia, Pa., September 16, 1898.

Number of cases of probable typhoid fever developed after leaving Knoxville..... 27

Total number of cases of probable typhoid fever developed in the First Pennsylvania Volunteer Infantry from May to October, 1898..... 222

These 222 cases were diagnosed as follows:

Typhoid fever	169
Malaria.....	24
Dengue.....	22
Diarrhea.....	1
Febricula.....	1
Enteritis.....	3
Dysentery.....	1
Camp fever	1

Total..... 222

It is probable that this regiment reached Chickamauga quite widely infected with typhoid fever, and that the number of cases in our list is short of the

actual one. Attention may be recalled to the statement of Lieutenant Harland in the June report. In this he states:

The only illness prevalent is a mild malarial fever, with gastro-enteric symptoms, running a course of about two weeks.

Considering this statement in the light of the evidence that we have since gained concerning the rarity of malaria at Chickamauga and in the light of the subsequent history of this regiment, we think that we must conclude that the surgeon was describing the earlier cases of the typhoid epidemic which led to the early return of this command to Philadelphia.

When this command reached Chickamauga it at first obtained its supply of drinking water from a driven well located on the Brotherton road, and between the camp of this regiment and that of the Second Ohio. Major Harland stated to us that the water from this well became inadequate in quantity and doubtful in quality. A sample of it was sent to Philadelphia for analysis. It appears that the examination was altogether chemical, and that an excess of chlorine was reported. "The excess of chlorine being out of proportion to the nitrogen, was supposed to be of mineral origin." (We have not been able to secure a copy of this analysis.) After the failure of this well water was for a short while obtained, according to Major Harland, from the pipes carrying Chickamauga Creek water. How long water was obtained from this source we have been unable to ascertain. Major Harland told us that the pipe water was found to be muddy as soon as heavy rains fell, and after this occurred water was hauled in barrels from Georgia Mineral Spring. Later the supply was obtained from the Boynton Spring, because it was nearer camp. There were no pipes in either of these springs, and the water was dipped up in pails, placed in headless barrels, and hauled to the regiment.

On account of the rocky character of the soil sinks could not be dug to a depth of more than 2 feet. This shallow drainage soon became filled and very offensive. Major Harland spoke of them as being in "a loathsome condition." This condition continued until the camp was moved into the open. After heavy rains these shallow sinks overflowed, polluted the soil for some distance around them, and became "exceedingly offensive." Add to these conditions the fact that the flies swarmed alternately on fecal matter and food, and it must be admitted that the conditions favorable to the spread of typhoid fever were not wanting in this camp.

In regard to the malarias that prevailed according to the sick report soon after this regiment reached Chickamauga, Major Harland made the following statement to us:

We had a form of malaria that looked much like typhoid fever, but the men would recover in a week or ten days, so I supposed it was not that. I did not recognize it as malaria; there were no pronounced chills; there was intense headache, intense pain in the kidneys, and evidently engorgement of the kidney. I do not

know what the disease was. Sometimes I called it "camp fever" and sometimes I called it "quotidian malaria." We did not have any blood examinations made.

In answer to questions Major Harland stated that the men suffering from these so-called malarias were sent to the Second Division hospital, and that about the middle of August many of these cases developed into typhoid fever. By reference to our list of cases it will be seen that typhoid fever became epidemic earlier than Major Harland—who was then speaking from memory and general impressions—thought. Our list shows only occasional cases for the first two months. However, we are of the opinion that we have not gotten all the earlier cases. For instance, we show only one case for June, and it is in his report for this month that Major Harland makes the statement already quoted in which he refers to the epidemic of malaria with gastro-enteric symptoms and running for two weeks. However, following the list as we have it, the epidemic began to show itself in pronounced form during the latter part of July and continued until the regiment was furloughed in Philadelphia. We believe, however, that if we could have obtained all the facts it would have been found that typhoid fever progressed more evenly in this command than is indicated by the charts.

It is unfortunate that we have not been able to ascertain the exact time when this regiment used the Chickamauga Creek water, because it would be of great interest to endeavor to determine whether or not this water influenced the typhoid curve. Moreover, this appears to be the only regiment in this division that used this water.

In his testimony before our board Major Harland stated that the tents of this command while at Chickamauga became very filthy, that they were not opened and their contents exposed to the sun daily, and that he frequently observed mold and fungi growing in the tents. He strongly urged a change of location, and finally the tents were shifted from the wood into the adjoining open space. He did not think that the cases of typhoid fever were grouped by tents, or at least he had not observed that men in the same tent were likely to develop typhoid fever about the same time, but he had noticed that one company had suffered much less than others in its total sickness. The men of this fortunate company were not ranked as high socially at home as were the men of companies that had more illness. We frequently heard similar statements from the medical officers of other regiments. It seemed to be quite widely observed that men from the high classes of society suffered more from illness than others less fortunately situated socially. We state that this seemed to be widely observed, but on this point we have no positive information. As a general rule we found that general impressions were erroneous. However, it is possible that the men who had more money to spend indulged themselves more freely in purchases from hucksters and other venders of delicacies of doubtful

composition and antecedents. There is no proof, however, that such men furnished a larger proportion of cases of typhoid fever.

In his testimony before our board, Major Harland made the following statement of his opinion concerning the origin and spread of typhoid fever in his regiment:

The regiment was entirely free from typhoid fever until the disease was brought in some other regiments that came to the park. The men may have gotten the infection in milk or their clothes, and I think that it was spread by flies bringing the matter from the sinks.

We quote this statement mainly because it was so commonly made to us. Each medical officer seemed confident that his own regiment was free from typhoid fever until some other command brought the disease to the park. Now, if we turn back to the sick reports of the First Pennsylvania, we find that typhoid fever was reported in this command every month. Why look for its importation from other organizations when the regiment itself took the infection with it from Mount Gretna, and its surgeon officially recognized its presence in every monthly report?

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Chatham, John P.....	Pvt., B	1898, Sept. 8	Chickamauga, Ga	Typhoid.
Dolan, Charles.....	Pvt., E	Aug. 5do	Appendicitis.
Elliott, George.....	Pvt., B	Aug. 27do	Typhoid.
Foley, John A.....	Pvt., F	Sept. 23	Philadelphia, Pa	Do.
Kohl, Charles B.....	Pvt., A	Oct. 8do	Do.
Kohring, William J.....	Pvt., E	Aug. 8	Chickamauga, Ga	Camp fever; typhoid.
McIntyre, John D....	Pvt., H	Sept. 13	Philadelphia, Pa	Typhoid.
Maguire, James F....	Pvt., C	Sept. 18do	Do.
Martin, Mark.....	Pvt., G	Oct. 30do	Do.
Marren Frank.....	Pvt., B	Aug. 28do	Do.
Pearsons, Henry.....	Lt., H	Dec. 1do	Tuberculosis.
Schaperkottor, Bernard.	Pvt., D	Aug. 10	Chickamauga, Ga	Typhoid.
Williams, Howard A..	Pvt., A	Oct. 4	Philadelphia, Pa	Do.
Zane, Jacob S.....	Corpl., G	July 2do	Do.

Total deaths.....	14
Deaths due to typhoid fever.....	12
Percentage of deaths among cases of probable typhoid fever (222), 5.40.	
Percentage of deaths among cases of recognized typhoid fever (169), 7.10.	

COMMUNICATIONS FROM THE SURGEONS OF THE FIRST PENNSYLVANIA VOLUNTEER INFANTRY.

Medical officers.

William G. Harland, major and surgeon, Philadelphia, Pa.

Joseph P. Tunis, lieutenant and assistant surgeon, Philadelphia, Pa.

Major Harland states:

I was not in charge of the records nor was I responsible for the medical department of the regiment until June 30, when I was assigned to duty as regimental surgeon. Before that date I acted as assistant surgeon, Maj. L. S. Smith being regimental surgeon. After I took charge all sick were sent to Second Division hospital in the first days of their illness, consequently all my records are necessarily faulty and inaccurate. I had no means of following up the cases, being too busy.

I am sure that there were fevers besides typhoid at Camp Thomas. I studied the cases as best I could and have come to the conclusion that most of the symptoms in these cases were those of dengue. I send you the following quotation from a paper which will probably appear in the supplement to the report of the adjutant-general of the National Guard of Pennsylvania for 1898:

"It was an infectious disease with an incubation period of a day or so. It began suddenly with chills and intense occipital headache, pain in back and in bones. The temperature was high (105° to 106°) and was accompanied with mild delirium, insomnia, restlessness, and nightmares. Occasionally petechiae and blotching of the skin were observed. These symptoms continued for from three to four days; then there was a rapid decline of the fever. After a few days symptoms of catarrhal jaundice, yellow skin, and clay stools set in. Constipation alternated with diarrhea. The acute symptoms passed away in a week, but the patients were left much prostrated and unnerved. The disease was quick to recur, but was not fatal. The rapid decline of the fever, the absence of the usual intestinal symptoms, of the usual characteristic stools, spots, and facies, all precluded the idea of typhoid in typical form."

I myself had two attacks after leaving, one in December and another in April, both just after handling camp equipments. My sister had an attack shortly after my return from Knoxville. I have had typhoid fever and have treated many cases in Philadelphia, and I feel convinced that some fever besides typhoid fever was present in camp during June and July. I therefore feel justified in objecting to the conclusions you draw from the statements made in my reports. There were many cases of diarrhea which were ascribed at the time to the change of water and to travel rations; some of these may have been mild cases of typhoid fever. Your deduction, that we had the typhoid infection when we left Philadelphia and that this was a source of the epidemic, is probably true, but the cases I referred to in the June report were not typhoid fever. To ignore the other fevers is to ignore, in my opinion, an important factor in the predisposition to disease. It also tends to lessen the mortality percentage and can not but vitiate your conclusions.

Comment: As we have already stated in giving the history of this regiment, we do not believe that the claim that dengue prevailed extensively in the First Pennsylvania Volunteer Infantry, while it was absent from all other regiments of the First and Third Army Corps, deserves any serious attention. It must be erroneous.

FOURTEENTH MINNESOTA VOLUNTEER INFANTRY.

Third Brigade, Second Division, First Army Corps.

The May report is signed by Major Cole, who makes the following statement:

We are having quite an epidemic of measles, which we brought with us from Camp Ramsey. The diarrheas are simply catarrhal, probably caused by change of climate. It is difficult to get the amount of water we need, and at first the men drank surface water. We can not get sufficient water for common cleanliness.

CONDENSED SICK REPORT FROM MAY 10 TO MAY 31, INCLUSIVE.

Mean strength	1,032
Diarrhea	15
Indigestion	6
Dysentery	2
Malaria	1
Total	24

In the June report Major Cole makes the following statement:

We have had quite an explosion of measles, which we brought with us from Camp Ramsey. There are at present no recent cases. Gonorrheal cases were frequent after pay day. Enterocolitis was brought on mostly from buying truck from hucksters and eating it. There has been no epidemic disease in camp.

CONDENSED SICK REPORT FOR JUNE.

Mean strength	1,059
Diarrhea	4
Indigestion	4
Gastro-enteritis	18
Typhoid fever	3
Malaria	1
Other diseases	63
Total	93

It would be rather interesting to know the views of the surgeon of this regiment concerning an epidemic disease, as, is seen above, he states that there has been no epidemic disease in the camp, and still he reports quite an explosion of measles and records three cases of typhoid fever.

In the July report Major Cole states:

A good many cases of malaria have occurred, and are probably due to excessive rain, followed by extreme heat. We now have elegant water and the diarrheas are decreasing.

CONDENSED SICK REPORT FOR JULY.

Mean strength	1,317
Typhoid fever	5
Enteritis	1
Entero-colitis	4
Gastro-enteritis	6
Gastritis	1
Indigestion	1
Malaria	26
Other diseases	55
Total	99

The August report bears no comments.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength	1,142
Malaria	120
Typhoid fever	27
Gastro-enteritis	7
Entero-colitis	4
Acute indigestion	3
Diarrhea	11
Gastritis	1
Dysentery	1
Other diseases	30
Total	204

This regiment left Chickamauga Park, Ga., August 28, and proceeded to Camp Poland, near Knoxville, Tenn.

In the September report Major Cole makes the following statement:

This command left Camp Poland, where it was in the Third Brigade of the Third Division of the First Army Corps, September 20, and proceeded to St. Paul, Minn., to be mustered out of service. It arrived at St. Paul September 23 and located camp at Kittsondale. The regiment was furloughed for thirty days, September 29.

We have failed to obtain an abstract of this report.

We will not give a list of the probable typhoid fever cases in this regiment, but will content ourselves with a statement of the general conclusions reached after a thorough investigation of the regimental and hospital sick reports.

In the first place, we will state that we have been unable to ascertain the date when this regiment reached Chickamauga Park. The regimental reports do not give this date, and we have been unable to obtain it from the Adjutant-General's Office. We can only state that it was sometime during the latter half of May, probably about May 18, as this is the date upon which the other regiments of this brigade reached Chickamauga.^a The first question that arises is whether or not this regiment brought the typhoid infection with it when it reached Chickamauga. The first suspicious case is that of a private in Company K (No. 1), who reported sick May 27 and was returned to duty June 15. The diagnosis in this case was malaria. During the month of June there were three suspicious cases. Two of these occurred on June 3, and are as follows:

No. 2. Company M: Typhoid fever, June 3; returned to duty from division hospital July 6.

No. 3. Company E: Typhoid fever, June 3; furloughed August 3.

The other June case had its initial date on June 22, and is as follows:

No. 4. Company M: Typhoid fever, June 22; returned to duty July 10.

From these data it is certainly fair to conclude that this regiment, like most others at Chickamauga, reached that place infected with typhoid fever; however, the typhoid infection did not spread at first rapidly. During the month of July there were 15 probable cases; in August there were 95 cases; in September the number ran up to 139; besides these there are 33 cases the initial dates of which can not be ascertained; making in all 286 probable cases. Of the 286 probable cases, 146 have a diagnosis of typhoid fever in either the regimental or the hospital records; the remainder, 140 in number, are diagnosed malaria.

SUMMARY.

Assembled at Camp Ramsey, St. Paul, Minn., in April, 1898.	
Mustered into United States service May 10, 1898.	
Arrived at Chickamauga Park May 18, 1898	
Strength on arrival, 1,032.	
Date of first case of probable typhoid fever, May 27, 1898.	
Date of first case of recognized typhoid fever, June 3, 1898.	
Left Chickamauga Park August 29, 1898.	
Strength on departure, 1,277.	
Number of cases of probable typhoid fever developed at Chickamauga	114
Arrived at Knoxville, Tenn., August 30, 1898.	
Left Knoxville September 20, 1898.	
Number of cases of probable typhoid fever developed after leaving Chickamauga	139
Number of cases of probable typhoid fever for which the initial date can not be found in the records	33
Total number of cases of probable typhoid fever in the Fourteenth Minnesota from May to September, 1898..	286
These 286 cases were diagnosed as follows:	
Typhoid fever	146
Malaria	140
Total	286

^a We have ascertained from Major Cole that May 18 is the correct date.

From information furnished us by Major Cole, surgeon of this regiment, we have condensed the following: At Camp Ramsey many of the men suffered from colds and one case of measles developed. At Chickamauga the tents were not moved from their original positions. Most of the men slept on the ground all the time at Chickamauga, because lumber could not be obtained. At Chickamauga the drinking water was at first obtained from the well on the Brotherton road already referred to in discussing the history of the First Pennsylvania. This well was situated in a ravine at the intersection of the three regiments of this brigade. The water from this well was at first clear, but after it had been drawn upon for eight or ten weeks it became turbid and gave off a fecal odor. At first there were many cases of malaria, with typhoid conditions. These cases began to develop about July 4, 1898. The piped water was used for animals, but the men were instructed not to drink it. However, they may have filled their canteens with this water while watering their horses. After the well water became offensive the drinking water supply was brought a distance of about 6 miles from a spring, the name of which Major Cole could not give us.

The company sinks could not be dug deep enough, and after heavy rains they overflowed and became highly offensive. Attempts to fill them with ashes caused them to overflow and made matters worse. The dirt thrown from the sinks in digging them became, under the effects of the sun, hard clods, and when thrown back into the pits did not absorb the fluid. It was absolutely impossible to keep the sinks in good condition.

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Barnard, John D.....	Sgt., H.	1898. Oct. 18	Olivia, Minn.....	Typhoid.
Chellsen, Frank E.....	Pvt., b'nd	Nov. 19	St. Joseph's Hospital, St. Paul, Minn.	Typhoid and pneumonia.
Collyer, Percy.....	Mus., H.	May 28	Camp Thomas, Ga.....	Pneumonia.
Clusman, William.....	Pvt., L.	Oct. 31	Typhoid.
Gibson, Joshua E.....	Pvt., B.	Nov. 10	Typhoid and pneumonia.
Hogan, Arthur S.....	Corpl., K.	Sept. 22	Division hospital, Knoxville, Tenn.	Typhoid.
Houck, Geo. Miles.....	Sgt., D.	Oct. 1	Chicago, Ill.....	Do.
Hutchinson, John S.....	Pvt., H.	July 19	Do.
McEwen, John G.....	Pvt., C.	Oct. 5	Chickamauga, Ga.....	Do.
Peterson, Alfred R.....	Pvt., F.	Aug. 8	Camp Thomas, Ga.....	Typhoid fever.
Rose, Harry S.....	Pvt., I.	Sept. 6	Camp Poland, Tenn..	Typhoid.

Two deaths from typhoid, as shown by hospital records, should be added to this list.

Total deaths..... 13
Deaths due to typhoid fever..... 12

Percentage of deaths among probable cases of typhoid fever (286), 4.19.

Percentage of deaths among cases of recognized typhoid fever (146), 8.21.

COMMUNICATIONS FROM THE SURGEONS OF THE FOURTEENTH MINNESOTA VOLUNTEER INFANTRY.

Medical officers.

Alvinza B. Cole, major and surgeon, Fergus, Minn.

Charles E. Dutton, captain and assistant surgeon, Minneapolis, Minn.

John H. Dorsey, lieutenant and assistant surgeon, Glencoe, Minn.

Under date of July 18, 1899, Major Cole sends us the following statement:

When we arrived at Chickamauga there was not water enough in the well on the Brotherton road to supply the three regiments of our brigade. On account of the scarcity our men dug wells in the shale rock in the ravine near our camp and drank surface water. After a time the water from the well acquired a fecal odor. On closing the well, we hauled water from a spring 6 miles distant.

As to whether we carried typhoid fever with us from Camp Ramsey or not, I am of the opinion that we did not. The case of the private that sickened May 27, and was returned to duty June 15, does not look to be typhoid fever. One could scarcely expect a case of that disease to recover sufficiently to return to duty in eighteen days. We left Camp Ramsey May 15, and our first case of typhoid fever was reported June 3, thereby giving time for it to develop under the favorable condition that obtained with us at that time. It is true that the length of time does not exclude the possibility that the disease might have been brought with us, but the inference would naturally be drawn that, in the absence of any history to that effect, it was acquired after our arrival at Camp Thomas.

SECOND OHIO VOLUNTEER INFANTRY.

Third Brigade, Second Division, First Army Corps.

This regiment reached Chickamauga Park, Ga., May 18, 1898. The first sick report covers the period from May 10 to May 31.

In the May report Dr. C. S. Mueller, acting surgeon, makes the following statement:

A slight increase of diarrhea is prevalent in camp, possibly due to excessive drinking of water. The water supply of the camp is good in quality, but very deficient in quantity. The entire command was vaccinated during May. The sanitary condition of the camp is satisfactory.

CONDENSED SICK REPORT FROM MAY 10 TO 31, INCLUSIVE.

Mean strength	815
Indigestion	17
Dysentery	16
Colic	17
Diarrhea	2
Enteritis	3
Gastritis	2
Other diseases.....	36
Total	93

In the June report Captain Mueller states:

The general health of the command was good. Quite a number of cases of fever of no special type occurred, but mostly disappeared on calomel treatment. They seemed to be cases of enteritis caused

possibly by ptomaines. Four hundred and six new recruits came in and were mostly vaccinated by the regimental surgeon. The water supply was very scarce and the quality quite bad after the hard rains, so that a condemnation of the well supplying the water was considered. An inspection was made every afternoon by the regimental surgeon and the officer of the day. The garbage holes and sinks were covered twice a day, if possible, with ashes or with dust.

The companies received Buzzicott's cooking outfits.

CONDENSED SICK REPORT FOR JUNE.

Mean strength	1,224
Gastro-enteritis	3
Diarrhea	8
Measles	3
Gonorrhea	25
Enteritis	2
Malarial typhoid	1
Other diseases	23
Total	65

The case of so-called malarial typhoid was that of a private in Company L. He was taken sick on June 22, and was sent to division hospital, where he died July 3.

Sick report for July is signed by Capt. Louis J. Stueber who makes no comment.

CONDENSED SICK REPORT FOR JULY.

Mean strength	1,329
Gonorrhea	28
Malarial typhoid	10
Malarial tertian	7
Malaria	1
Diarrhea	3
Intermittent fever	1
Other diseases	32
Total	82

The sick report for the month of August is signed by Captain Stueber without comment.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength	1,329
Malarial typhoid	17
Typhoid fever	22
Malaria	4
Tertian malaria	18
Malarial fever	83
Diarrhea	7
Dysentery	1
Gastritis	1
Not diagnosed	2
Total	155

This report gives the following additional figures:

Returned to duty	35
Died	2
Remaining sick in quarters and in hospital	142
Total	179

Notwithstanding the above statement, the sick report for August shows a list of 196 names and cases. This regiment left Chickamauga Park, Ga., and proceeded to Knoxville, Tenn., August 28. During its stay at Chickamauga Park 6 deaths occurred.

The September report is signed by Captain Stueber without comment.

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength	1,093
Diarrhea	32
Dysentery	1
Indigestion	18
Gastritis	1
Not diagnosed	1
Malarial fever	176
Malaria	13
Tertian malaria	18
Typhoid and malarial typhoid	64
Other diseases	93
Total	417

The tabulated "numerical report" for the month deserves passing notice. It is as follows:

Remaining from last month	329
Returned to duty	141
Died	8
Discharged for disability	1
Remaining on sick report and in hospital	79
In quarters	57
On furlough	140

The October report is signed by Captain Stueber without comment.

CONDENSED SICK REPORT FOR OCTOBER.

Mean strength	1,100
Malarial fever	233
Tertian malaria	10
Malaria	7
Diarrhea	14
Not diagnosed	1
Chronic gastritis	1
Typhoid and malarial typhoid	66
Other diseases	104
Total	436

We will now give a list of the possible typhoid cases in this regiment. In doing so we will give a complete medical history of each individual so far as such a history can be obtained from the regimental and hospital reports.

No. 1. Gastro-enteritis, May 20 to June 30. If this was a case of typhoid fever, the regiment brought the disease with them when they reached Chickamauga.

No. 2. Diarrhea, June 1 to 10. This may not have been a case of typhoid fever, but compared with the other diarrheas it was exceptionally prolonged.

No. 3. Diarrhea, June 10 to 27.

No. 4. Enteritis, June 16 to September 5. This case was sent to division hospital July 7 without diagnosis. In the hospital it was diagnosed as a case of enteritis.

No. 5. Typhoid fever, June 22; died July 3.

No. 6. Typhoid fever, July 1 to 27.

No. 7. Tertian malaria, July 2 to 31.

No. 8. Malarial typhoid, July 3; furloughed September 30.

No. 9. Malarial fever, without date; sent to division hospital July 4; returned to duty July 13.

No. 10. Tertian malaria, July 6; returned to duty July 21.

No. 11. Remittent malaria, without date; sent to division hospital July 6; returned to sick quarters July 22.

No. 12. Typhoid fever, July 7; still sick September 30.

No. 13. Dyspepsia, May 12 to 16; gastritis, July 11; sent to Sternberg Hospital, without date; still sick July 31. This name can not be found on the records of Sternberg Hospital.

No. 14. Typhoid fever, July 12; sick in quarters July 27. This man is reported with remittent malaria from September 19 to October 5.

No. 15. Diarrhea, July 13; sent to division hospital July 26; still sick July 31. There is no evidence on the record that this man was returned to duty.

No. 16. Diarrhea, July 14 to 25.

No. 17. Malarial fever, July 17; sent to division hospital August 22; furloughed August 23.

No. 18. Malarial typhoid fever, July 19; furloughed August 6.

No. 19. Tertian malaria, July 20; sent to division hospital July 21; furloughed August 20.

No. 20. Malarial fever, July 20; sent to division hospital July 21.

Here the diagnosis was changed to continued malaria, and the patient was furloughed August 12.

No. 21. Malarial fever, July 20; sent to division hospital July 21; still sick July 31. There is no record of this man having returned to duty.

No. 22. Malarial fever, July 21; in division hospital August 18. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 17.

No. 23. Typhoid fever, July 21; furloughed September 1.

No. 24. Malarial fever, July 21; sick in quarters July 31. There is no further record of this patient.

No. 25. Malarial typhoid, July 22 to August 18.

No. 26. Typhoid fever, July 22; died July 30.

No. 27. Typhoid fever, July 26; furloughed August 20.

No. 28. Typhoid fever, July 26; sent to division hospital August 3. Here the disease was diagnosed as malaria, and the patient was left on the sick list August 31. After this date the name does not occur.

No. 29. Intermittent fever, July 29; sent to division hospital July 31. Here the diagnosis was changed to typhoid fever, and the patient was furloughed August 10.

No. 30. Typhoid fever, July 29 to September 27.

No. 31. Malarial fever, August 2 to October 19.

No. 32. Typhoid fever, August 2; furloughed August 9; returned to duty October 18.

No. 33. Typhoid fever, August 2; furloughed September 8.

No. 34. Malarial fever, August 2; sent to Sternberg Hospital August 25. The diagnosis was changed to typhoid fever, and the patient was furloughed September 24.

No. 35. Malarial typhoid, August 2; sent to division hospital August 8; furloughed August 19.

No. 36. Malarial typhoid, August 2; furloughed August 20.

No. 37. Malarial fever, August 3; still sick August 31.

No. 38. Malaria, August 3 to 18.

No. 39. Malaria, August 3 to September 21.

No. 40. Malarial fever, August 4; sent to division hospital August 8. Here the diagnosis was changed to typhoid fever, and the patient was furloughed August 24.

No. 41. Malarial fever, August 4; furloughed August 23.

No. 42. Malarial fever, August 5; still sick August 31.

No. 43. Malarial fever, August 5; sent to division hospital August 6. Here the diagnosis was changed to enteric fever, and the patient was furloughed August 16.

No. 44. Malarial fever, August 5 to 30.

No. 45. Malarial fever, August 5 to 17.

No. 46. Typhoid fever, August 5; furloughed without date.

No. 47. Malarial fever, August 6; sent to division hospital August 8. Here the diagnosis was changed to typhoid fever. There is no record of the disposition of this patient.

No. 48. Malarial fever, August 7; furloughed August 23.

No. 49. Malarial fever, August 7; still sick August 31. There is no record of this man after the last-mentioned date.

No. 50. Typhoid fever, August 7; died August 31.

No. 51. Malarial fever, August 7; furloughed August 21.

No. 52. Indigestion, May 28 to 31; enteritis without date; sent to division hospital August 8; furloughed August 21.

No. 53. Gastro-enteritis, June 1 to 17.

No. 54. Malarial fever, August 8 to September 24.

No. 55. Malarial fever, August 8; furloughed August 21; returned to duty in October.

No. 56. Malarial fever, August 8 to September 21.

No. 57. Malarial fever, August 9; sent to division hospital August 9. Here the diagnosis was changed to typhoid fever, and the patient was furloughed August 24.

No. 58. Malarial fever, August 9; sent to division hospital August 20. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 3.

No. 59. Malarial fever, August 9; furloughed August 18.

No. 60. Malarial fever, August 10; furloughed August 19; not returned to duty October 31.

No. 61. Malarial fever, August 10; sent to Sternberg Hospital August 20. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 15.

No. 62. Typhoid fever, August 10; furloughed August 22.

No. 63. Malarial typhoid, August 10; furloughed September 5.

No. 64. Indigestion, May 18 to 20; malarial fever, August 10 to September 13.

No. 65. Malarial fever, August 10; sent to Sternberg Hospital August 20. Here the diagnosis was changed to continued malaria, and the patient was furloughed October 9.

No. 66. Malarial fever, August 11; furloughed August 24.

No. 67. Typhoid fever, August 12; furloughed August 21.

No. 68. Malarial typhoid, August 12; furloughed August 24. In Sternberg Hospital the diagnosis was changed to continued malaria.

No. 69. Malarial fever, August 13; furloughed August 24; returned to duty October 12.

No. 70. Malarial fever, August 13; sent to division hospital August 20. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 5. This man had malaria August 6 and 7.

No. 71. Malarial fever, August 13 to September 22.

No. 72. Malarial fever, August 13 to October 31.

No. 73. Malarial fever, August 13; sent to division hospital August 13. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 19.

No. 74. Malarial fever, August 13; still sick September 30.

No. 75. Malarial typhoid, August 13; furloughed September 2.

No. 76. Typhoid fever, August 13; sent to Sternberg Hospital without date. This man's name can not be found upon the records of the Sternberg Hospital.

No. 77. Malarial fever, August 14; sent to Sternberg Hospital August 27. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 2.

No. 78. Malarial fever, August 14; sent to division hospital without date. Here the diagnosis was changed to typhoid fever, and the patient was returned to duty September 11.

No. 79. Malarial fever, August 14 to September 30.

- No. 80. Malarial fever, August 14 to September 16.
 No. 81. Malarial fever, August 15; furloughed September 1. This man had indigestion May 14 to 18.
 No. 82. Typhoid fever, August 15; furloughed September 2.
 No. 83. Typhoid fever, August 15 to October 22.
 No. 84. Malarial fever, August 15; furloughed September 9.
 No. 85. Malarial fever, August 15 to 30.
 No. 86. Malarial fever, August 15 to September 30.
 No. 87. Malarial fever, August 15; still sick August 31.
 No. 88. Malarial fever, August 15; sent to division hospital August 29. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 17.
 No. 89. Malarial fever, August 16 to October 19.
 No. 90. Malarial fever, August 16 to September 24.
 No. 91. Typhoid fever, August 16; furloughed August 31.
 No. 92. Malarial fever, August 17; furloughed August 28.
 No. 93. Malarial fever, August 17; sent to division hospital August 23. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 1.
 No. 94. Malarial fever, August 17; sent to division hospital without date. Here the diagnosis was changed to typhoid fever, and the patient was furloughed October 9.
 No. 95. Typhoid fever, August 17; furloughed September 5.
 No. 96. Malarial fever, August 17 to September 21.
 No. 97. Malarial fever, August 17 to September 23.
 No. 98. Malarial fever, August 18; sent to division hospital without date. Here the disease was diagnosed as typhoid fever, and the patient was discharged October 8.
 No. 99. Malarial fever, August 18. The man was sent to division hospital without date. Here the disease was diagnosed as typhoid fever, and the patient was furloughed October 1.
 No. 100. Malarial fever, August 18; sent to Sternberg Hospital without date. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 3.
 No. 101. Malarial fever, August 18; furloughed September 5.
 No. 102. Malarial fever, August 18 to October 15.
 No. 103. Malarial typhoid, August 18 to September 2.
 No. 104. Malarial typhoid, August 19; sent to Sternberg Hospital August 27. Here the diagnosis was changed to continued malaria, and the patient was furloughed October 20.
 No. 105. Malarial fever, August 19; sent to Sternberg Hospital August 27. Here the disease was diagnosed continued fever, and the patient was furloughed October 4. This man had dysentery May 27 to May 30.
 No. 106. Typhoid fever, August 19; died September 5.
 No. 107. Malarial fever, August 20; sent to Sternberg Hospital August 27. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 1.
 No. 108. Typhoid fever without date; sent to division hospital August 20; furloughed September 10.
 No. 109. Malarial fever, August 20; still sick October 31.
 No. 110. Malarial fever, August 20; sent to division hospital August 27. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 21.
 No. 111. Typhoid fever, August 20; no disposition given.
 No. 112. Malarial fever, August 20 to September 21.
 No. 113. Malarial fever, August 20; sent to division hospital without date. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 14. This man had malarial fever August 9 and 10.
 No. 114. Malarial fever, August 20; furloughed September 2.
 No. 115. Typhoid fever, August 20; furloughed August 29.
 No. 116. Malarial fever, August 20 to October 31.
 No. 117. Malarial fever, August 20; sent to division hospital August 25. Here the diagnosis was changed to continued malaria, and the patient was furloughed September 16.
 No. 118. Typhoid fever, without date; sent to division hospital August 20; furloughed August 25.
 No. 119. Malarial fever, August 21 to September 30.
 No. 120. Malarial fever, August 21; sent to division hospital August 21. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 2.
 No. 121. Malarial fever, August 21; sent to Sternberg Hospital August 27. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 1.
 No. 122. Malarial fever, August 21; furloughed September 5.
 No. 123. Malarial fever, August 21; sent to division hospital August 21. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 3, and returned to duty October 9.
 No. 124. Typhoid fever, August 21; sent to Sternberg Hospital August 21, and furloughed October 4.
 No. 125. Malarial fever, August 22 to September 12.
 No. 126. Malarial fever, August 22; sent to Sternberg Hospital August 27. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 17.
 No. 127. Malarial fever, August 22 to October 13.
 No. 128. Typhoid fever, August 22; furloughed from hospital September 22.
 No. 129. Malarial fever, August 22; furloughed September 2.
 No. 130. Typhoid fever, August 22; furloughed September 23.
 No. 131. Malarial fever, August 22; sent to division hospital August 26. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 5.
 No. 132. Malarial fever, August 23; sent to division hospital August 26. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 2.
 No. 133. Diarrhea, August 23; sent to division hospital August 23. Here the diagnosis was changed to remittent malaria, and the patient was furloughed September 5.
 No. 134. Dysentery, August 23 to September 27.
 No. 135. Malarial fever, August 23; sent to division hospital August 25. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 11. This man had malarial fever August 13, and the record is left incomplete at this point.
 No. 136. Malarial fever, August 23 to September 28.
 No. 137. Continued malaria, without date; sent to division hospital August 23; furloughed August 27.
 No. 138. Typhoid fever, August 24; died September 1.
 No. 139. Malarial fever, August 24; sent to division hospital August 30. Here the diagnosis was changed to typhoid fever, and the patient died September 8.
 No. 140. Malarial fever, August 24; sent to division hospital August 30. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 21. This man is recorded as having had malaria August 20, and this record is left incomplete.
 No. 141. Malarial fever, August 25; furloughed September 2.
 No. 142. Typhoid fever, August 26; died September 17.
 No. 143. Malarial fever, August 26; sent to division hospital August 29. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 24.
 No. 144. Malarial fever, August 26; sent to division hospital without date. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 2. He returned to duty October 4.
 No. 145. Diarrhea, August 26 to September 30.
 No. 146. Malarial fever, August 26 to October 31.
 No. 147. Malarial fever, August 26; sent to Sternberg Hospital August 27. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 1.
 No. 148. Malarial fever, August 26; sent to division hospital without date. Here the diagnosis was changed to typhoid fever, and the patient was furloughed November 14.
 No. 149. Diarrhea, August 26; sent to division hospital August 29. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 27.
 No. 150. Typhoid fever, without date; sent to division hospital August 27; furloughed September 1.

No. 151. Typhoid fever, without date; sent to division hospital August 27; furloughed September 2.

No. 152. Malarial typhoid, August 27; furloughed September 5.

No. 153. Malarial fever, August 27; sent to Sternberg Hospital August 27. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 2.

No. 154. Diarrhea, August 27; still sick September 30.

No. 155. Malarial typhoid, August 27; furloughed September 2.

No. 156. Malarial typhoid, August 27; furloughed September 1.

No. 157. Malarial fever, August 27; sent to Sternberg Hospital August 27. Here the diagnosis was changed to typhoid fever, and the patient was furloughed October 4.

No. 158. Remittent malaria, August 27; sent to division hospital August 27. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 2.

No. 159. Malarial fever, August 27; sent to division hospital August 30. Here the diagnosis was changed to typhoid fever, and the patient was furloughed October 19.

No. 160. Typhoid fever, August 27; furloughed October 12.

No. 161. Typhoid fever, without date; sent to division hospital August 27; furloughed September 1. This man was a hospital steward.

No. 162. Malarial typhoid, August 28; furloughed September 3.

No. 163. Malaria, August 28; sent to Sternberg Hospital August 28. Here the diagnosis was changed to typhoid fever and the patient was furloughed September 1.

No. 164. Malarial fever, August 29; sent to division hospital August 29. Here the diagnosis was changed to typhoid fever. The hospital disposition of this patient is not given.

No. 165. Malarial fever, August 29; sent to division hospital August 30. Here the diagnosis was changed to typhoid fever and the patient was furloughed September 22.

No. 166. Malarial fever, August 29; sent to division hospital August 29. Here the diagnosis was changed to typhoid fever and the patient was furloughed September 21.

No. 167. Malarial fever, August 30 to October 13.

No. 168. Typhoid fever, August 30; furloughed from hospital September 27.

No. 169. Malarial typhoid, August 30; furloughed from hospital October 19. This man is recorded as having had malarial fever August 22, but this record is left incomplete.

No. 170. Malarial fever, August 31; furloughed September 6.

No. 171. Malarial fever, August 31; furloughed September 6.

No. 172. Malarial fever, August 31; furloughed September 6.

No. 173. Malarial fever, September 1 to October 1.

No. 174. Malarial fever, September 1; sent to division hospital September 19. Here the disease was diagnosed typhoid fever and the patient was furloughed without date.

No. 175. Remittent malaria, September 1 to October 5.

No. 176. Malarial fever, September 1; sent to division hospital September 2. Here the diagnosis was changed to typhoid fever and the patient was furloughed September 6.

No. 177. Malarial fever, September 1; still sick October 31.

No. 178. Malarial fever, September 1 to 21.

No. 179. Malarial fever, September 1; sent to division hospital September 10. Here the disease was diagnosed typhoid fever and the patient was furloughed October 29.

- No. 270. Malarial fever, September 14; furloughed September 25.
- No. 271. Malarial fever, September 14; furloughed October 16.
- No. 272. Malarial fever, September 14; sent to division hospital September 16. Here the diagnosis was changed to typhoid fever, and the patient was furloughed October 14. This man had dyspepsia May 25 to 29.
- No. 273. Typhoid fever, September 14; died October 2.
- No. 274. Typhoid fever, September 14; died September 28.
- No. 275. Malarial fever, September 14 to October 22.
- No. 276. Malarial fever, September 14; still sick October 31.
- No. 277. Typhoid fever, September 14; furloughed October 24.
- No. 278. Malarial fever, September 15; sent to division hospital September 29. Here the diagnosis was changed to typhoid fever, and the patient was furloughed October 24.
- No. 279. Typhoid fever, September 15; furloughed October 5.
- No. 280. Malaria, September 15; sent to division hospital September 16. Here the diagnosis was changed to typhoid fever, and the patient was furloughed October 1.
- No. 281. Typhoid fever, September 15; furloughed October 14.
- No. 282. Malarial fever, September 15; furloughed October 10.
- No. 283. Malarial fever, September 15 to 26.
- No. 284. Malarial fever, September 15; sent to division hospital September 16. Here the diagnosis was changed to typhoid fever, and the patient was furloughed October 1.
- No. 285. Malaria, September 16; sent to division hospital September 16. Here the diagnosis was changed to typhoid fever, and the patient was furloughed October 14.
- No. 286. Typhoid fever, September 16; furloughed October 5. This man had indigestion May 17 to 20.
- No. 287. Malarial fever, September 16; sent to division hospital September 16. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 19.
- No. 288. Diarrhea, September 16 to October 4.
- No. 289. Malarial fever, September 16; sent to division hospital September 30. Here the diagnosis was changed to typhoid fever, and the patient was furloughed October 28.
- No. 290. Malarial fever, September 16; furloughed October 5.
- No. 291. Indigestion, September 16 to October 1.
- No. 292. Malarial fever, September 16; sent to division hospital September 16. Here the diagnosis was changed to typhoid fever, and the patient was furloughed October 28.
- No. 293. Typhoid fever, without date; sent to division hospital November 8; furloughed November 13.
- No. 294. Malarial fever, September 17, furloughed October 5.
- No. 295. Malarial fever, September 17, furloughed October 5.
- No. 296. Malarial fever, September 17; sent to division hospital September 17. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 29.
- No. 297. Malarial fever, September 17; furloughed October 23.
- No. 298. Malarial fever, September 18; sent to division hospital September 19. Here the diagnosis was changed to enteric fever, and the patient was furloughed October 24.
- No. 299. Malarial fever, September 18; furloughed October 19.
- No. 300. Malarial fever, September 18; furloughed October 5.
- No. 301. Malarial fever, September 18 to October 6.
- No. 302. Malarial fever, September 18; still sick October 31.
- No. 303. Malarial fever, September 18; still sick October 31.
- No. 304. Malarial fever, September 18; still sick October 31.
- No. 305. Diarrhea, September 19; still sick October 31.
- No. 306. Diarrhea, September 19; still sick October 31.
- No. 307. Typhoid fever, September 19; furloughed October 14.
- No. 308. Typhoid fever, September 19; furloughed October 19.
- No. 309. Malarial fever, September 19; sent to division hospital September 23. Here the diagnosis was changed to typhoid fever, and the patient was furloughed October 7.
- No. 310. Malarial fever, September 19 to 30.
- No. 311. Diarrhea, September 19 to October 5.
- No. 312. Malarial fever, September 19 to 30.
- No. 313. Malarial fever, September 19; sent to division hospital September 23. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 27.
- No. 314. Malarial fever, September 19; still sick October 31.
- No. 315. Malarial fever, September 19 to October 27.
- No. 316. Malarial fever, September 19; still sick October 31.
- No. 317. Malarial fever, September 20 to October 4.
- No. 318. Typhoid fever, September 20 to October 31.
- No. 319. Typhoid fever, September 20; furloughed November 20. This man had dysentery May 24 and 25.
- No. 320. Malarial fever, September 20 to October 18.
- No. 321. Malarial fever, September 21; furloughed October 1.
- No. 322. Malarial fever, September 21; sent to division hospital September 23. Here the disease was diagnosed as typhoid fever, and the patient was furloughed October 10.
- No. 323. Malarial fever, September 21; furloughed October 7.
- No. 324. Typhoid fever, September 21; furloughed October 19.
- No. 325. Malarial fever, September 21 to October 27.
- No. 326. Malarial fever, September 22; still sick October 31.
- No. 327. Diarrhea, September 22; still sick October 31.
- No. 328. Typhoid fever, September 23; furloughed October 24.
- No. 329. Malarial fever, September 23 to October 8.

No. 330. Malarial fever, September 24; sent to division hospital September 24. Here the diagnosis was changed to typhoid fever, and the patient was furloughed October 14.

No. 331. Diarrhea, September 24; still sick October 31. This man had indigestion May 26 to 31.

No. 332. Malarial fever, September 25; still sick October 31.

No. 333. Malarial fever, September 25; sent to division hospital September 27. Here the diagnosis was changed to typhoid fever, and the patient was furloughed October 14.

No. 334. Malarial fever, September 26; sent to division hospital September 29. Here the diagnosis was changed to typhoid fever, but the disposition of the patient is not given.

No. 335. Malarial fever, September 26; sent to division hospital September 28. Here the diagnosis was changed to typhoid fever, and the patient was discharged some time in November.

No. 336. Typhoid fever, September 26; furloughed October 24.

No. 337. Typhoid fever, September 26; still sick October 31. This case was first diagnosed as indigestion.

No. 338. Typhoid fever, September 26; furloughed October 17.

No. 339. Malarial fever, August 29; sent to division hospital August 30. Here the diagnosis was changed to typhoid fever and the patient was furloughed September 21.

No. 340. Malarial fever, September 27 to October 21.

No. 341. Malarial typhoid, September 27; furloughed October 19.

No. 342. Malarial fever, September 27; sent to division hospital September 29. Here the diagnosis was changed to typhoid fever and the patient was furloughed October 17.

No. 343. Malarial fever, September 27; still sick October 31.

No. 344. Indigestion, September 28; sent to division hospital October 4. Here the diagnosis was changed to typhoid fever and the patient was furloughed October 24.

No. 345. Malarial fever, September 28; still sick October 31.

No. 346. Malarial fever, September 28; sent to division hospital September 28. Here the diagnosis was changed to typhoid fever and the patient was furloughed October 14.

No. 347. Typhoid fever, September 28; still sick October 31.

No. 348. Malarial fever, September 28; still sick October 31.

No. 349. Malarial fever, September 30; sent to division hospital September 30. Here the diagnosis was changed to typhoid fever and the patient returned to duty October 30.

No. 350. Malarial fever, September 30 to October 15.

No. 351. Typhoid fever, without date; sent to division hospital October 1; furloughed October 17.

No. 352. Typhoid fever, October 1; furloughed October 24.

No. 353. Indigestion, October 1 to 16.

No. 354. Diarrhea, October 1; furloughed October 14.

No. 355. Typhoid fever, October 1; sent to Fort Meyer November 20.

No. 356. Malarial fever, October 2 to 19.

No. 357. Malarial fever, October 3 to 18.

No. 358. Typhoid fever, October 3; furloughed October 17.

No. 359. Indigestion, October 3 to 14.

No. 360. Indigestion, October 4; sent to division hospital October 10. Here the diagnosis was changed to remittent malaria and the patient was furloughed October 24.

No. 361. Typhoid fever, October 4; furloughed without date.

No. 362. Typhoid fever, October 4; furloughed November 20.

No. 363. Indigestion, October 5 to 19.

No. 364. Malaria, October 6 to 20.

No. 365. Malaria, October 6 to 24.

No. 366. Malaria, October 6; furloughed October 19.

No. 367. Malaria, October 6; furloughed November 1.

No. 368. Malaria, October 6; sent to division hospital October 15. Here the diagnosis was changed to typhoid fever and the patient was furloughed November 15.

No. 369. Malarial fever, October 6 to 22.

No. 370. Malarial fever, October 7; sent to division hospital October 13. Here the diagnosis was changed to typhoid fever and the patient was furloughed November 13.

No. 371. Malarial fever, October 7 to 26.

No. 372. Malarial fever, October 7 to 20. This man had malarial fever September 14, and there is no record of his return to duty after that time, but on October 7 his name occurs as having been admitted to sick report on that date.

No. 373. Malarial fever, October 8; sent to division hospital October 18. Here the diagnosis was changed to typhoid fever and the patient was furloughed November 8.

No. 374. Malarial fever, October 11; still sick October 31. This man had diarrhea September 3 to 5.

No. 375. Malarial fever, October 12; sent to division hospital October 15. Here the diagnosis was changed to typhoid fever and the patient was furloughed November 8.

No. 376. Malarial fever, October 13 to 23.

No. 377. Malarial fever, October 16; still sick October 31.

No. 378. Diarrhea, October 16 to 28.

No. 379. Malarial fever, October 17; still sick October 31.

No. 380. Malarial fever, October 17; furloughed November 15.

No. 381. Malarial fever, October 18; sent to division hospital October 18. Here the diagnosis was changed to typhoid fever, and the patient was furloughed November 8.

No. 382. Diarrhea, October 19; still sick October 31.

No. 383. Typhoid fever, October 19; furloughed November 21.

No. 384. Malarial fever, October 19; sent to division hospital October 24. Here the diagnosis was changed to typhoid fever, and the patient was furloughed November 15.

No. 385. Typhoid fever, October 20; still sick October 31.

No. 386. Malarial fever, October 20; still sick October 31.

No. 387. Diarrhea, October 21; still sick October 31.

No. 388. Malarial fever, October 22; sent to division hospital October 25. Here the diagnosis was changed to typhoid fever, and the patient was furloughed November 23.

No. 389. Typhoid fever, October 22; furloughed November 28.

No. 390. Malarial fever, October 22; sent to division hospital October 31. Here the diagnosis was changed to typhoid fever, and the patient was sent to Fort Myer, November 20.

No. 391. Typhoid fever, October 23; sent to Fort Myer, November 20.

No. 392. Malarial fever, October 25; still in hospital November 30.

No. 393. Malarial fever, October 25; still sick in hospital November 30.

No. 394. Malarial fever, October 25; still sick in hospital November 30.

No. 395. Indigestion, October 25; still sick in hospital November 30.

No. 396. Malarial fever, October 26; still sick November 30.

No. 397. Typhoid fever, October 26; furloughed November 23. This man had diarrhea May 13 to 16.

No. 398. Indigestion, October 28; still sick in hospital November 30.

No. 399. Malarial fever, October 28; still sick in hospital November 30. This man had indigestion May 20 to 23.

No. 400. Malarial fever, October 29; still sick in hospital November 30.

No. 401. Typhoid fever, November 10; sent to Fort Myer, November 20.

No. 402. Typhoid fever, November 12; furloughed November 15. This man is reported as being convalescent from typhoid fever at the time of his admission to the hospital; however, we can find neither in regimental nor hospital reports any record of this man previous to November 12.

No. 403. Malarial fever, without date; sent to division hospital October 8. Here the diagnosis was changed to typhoid fever and the patient was furloughed October 29.

SUMMARY.

Assembled at Columbus, Ohio, in April, 1898.

Mustered into United States service May 10, 1898.

Arrived at Chickamauga Park May 18, 1898.

Strength on arrival, 815.

Date of first case of probable typhoid fever, May 20, 1898.
 Date of first case of recognized typhoid fever, June 22, 1898.
 Left Chickamauga Park August 28, 1898.
 Strength on departure, 1,297.

Number of cases of probable typhoid fever developed at Chickamauga	160
Number of cases of protracted fever developed at Knoxville:	
From August 29 to 31.....	11
During September.....	178
During October.....	54
Total number of cases of protracted fever developed in the Second Ohio Volunteer Infantry	403
These 403 cases were diagnosed as follows:	
Typhoid fever.....	192
Malaria.....	170
Diarrhea.....	23
Gastritis.....	17
Enteritis.....	1
Total.....	403

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Ausman, Charles E....	Pvt., M.	1898 Sept. 27	Knoxville, Tenn.	Typhoid.
Bloom, William H....	Pvt., G.	Aug. 23	Camp Thomas, Ga.	Apoplexy.
Cole, Jesse R.....	Pvt., B.	Aug. 31	Chickamauga, Ga.	Typhoid.
Dinehart, William....	Pvt., I.	Oct. 2	Camp Poland, Tenn.	Enteric fever.
Dunson, Edward W....	Pvt., G.	Sept. 8	Knoxville, Tenn.	Typhoid and perforation.
Fisher, Jacob.....	Pvt., D.	Oct. 2	Knoxville, Tenn., Camp Poland.	Typhoid.
Gottfried, John.....	Pvt., C.	Sept. 28	Knoxville, Tenn.	Do.
Grummel, Frank J....	Pvt., E.	Sept. 7	Chickamauga, Ga.	Typhoid malaria.
Mayers, Elmer E.....	Pvt., L.	July 2	Enteric fever.
Messer, Earl L.....	Pvt., E.	Sept. 6	Tiffin, Ohio.	Do.
Potts, Dort.....	Pvt., D.	Aug. 31	Chickamauga, Ga.	Typhoid.
Shaffer, Ora L.....	Pvt., M.	Sept. 9	Knoxville, Tenn.	Do.
Wood, Thomas W.....	Pvt., M.	Sept. 20	do.	Enteric fever.
Wurts, Edward F.....	Pvt., B.	July 30	Camp Thomas, Ga.	Typhoid.

Total deaths.....	14
Deaths due to typhoid fever.....	13
Percentage of deaths among cases of protracted fever (403), 3.22	
Percentage of deaths among cases of recognized typhoid fever (192), 6.77.	

ADDENDUM TO THE SECOND DIVISION.

The Third North Carolina Volunteer Infantry was sent to Knoxville about the middle of September and there became a part of this division. A brief history of this regiment is attached hereto for the reasons detailed in the history.

THIRD NORTH CAROLINA VOLUNTEER INFANTRY.

This was a regiment of colored troops, mustered into service at Fort Macon, N. C., on July 19, 1898.

The first report covers the last part of July.

CONDENSED SICK REPORT FOR JULY 20 TO 31.

Mean strength	1,098
Admissions:	
From command.....	6
Total to be accounted for	6
Completed cases.....	0

The August report is signed by Major Dellinger, who makes the following remarks:

The prevailing diseases of this command will be seen to be malarial fever and bowel troubles, such as dysentery, diarrhea, etc. The malarial fever is, for the most part, a very mild variety. Less than half a dozen cases have shown symptoms of a malignant type. All have yielded gracefully to treatment save two cases still remaining—one in quarters and the other in hospital. As to cause, the malaria is probably due to a marsh lying to the west and north of the camp, which is alternately covered by the ebb and flow of the tide. But, doubtless, the fact of the prevailing winds, southwest, coming directly off the ocean, and the further fact of the sandy soil, so thoroughly filtering water, account for our not having had more of this trouble.

The guards lie down on the sand and sleep at night, sometimes reporting a chill the next morning. As to the bowel diseases, they are, for the most part, doubtless due to overeating. They grow beautifully less as the command grows older. As the night winds from the sea begin to grow colder, catarrhal troubles begin to manifest themselves. As a precautionary measure, the entire camp and surroundings are carefully policed. Special attention is given to the condition of the cooking places and the preparation of the food. The wells are systematically drained once a week. The water supply is good and abundant.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength	1,098
Admissions:	
Remaining from last month	6
From command	41
Total	47
Completed cases.....	28
Returned to duty.....	24
Discharged	4
Total	28
Remaining on sick report:	
Hospital	9
Quarters.....	10
Total	19

In the September report Major Dellinger makes the following remarks:

The command remained at Fort Macon, N. C., until the morning of September 14, at which time it left for Camp Poland, Knoxville, Tenn., arriving at the latter place on the evening of September 15, where it encamped in three different camp sites. On the morning of the 15th, on the Western North Carolina Railroad at Azales Switch, near Biltmore, N. C., the second section of our train was wrecked by an open switch, resulting in the injury of nine soldiers. None of these injuries were fatal. However, several were more or less serious. There were no fractures or dislocations. We brought to Knoxville only two sick men; one had typhoid fever and the other malarial fever. On our arrival at Knoxville we were kept practically out of doors for eighty-four hours awaiting orders where to pitch camp. We were afterwards moved to a camp site recently vacated by a regiment which had seen sickness at Chickamauga. Here we spent quite a week, during a large part of which it rained. The ground was wet and we had no floors in the tents. The water which was supplied from the city waterworks was cut off from time to time, making it necessary for our men to use spring water, which had been forbidden them, and the hydrant water is said to have been condemned. We have experienced great difficulty in securing lime for the sinks; nearly a week passed and none could be obtained, notwithstanding the fact that requisition after requisition was made for it by the surgeon in charge. This, I think, is sufficient to account for the epidemic of diarrhea which attacked our officers and men while on this site. We now occupy a more

healthy site and our sickness is now 100 per cent less. All the cooking is still done out of doors on account of there being no lumber with which to build kitchens.

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength	1,096
Admissions:	
Remaining from last month	16
From command	119
Total	135
Completed cases	56
Returned to duty	55
Died	1
Total	56
Remaining on sick report:	
Hospital	10
Quarters	54
Total	64

In the October report Major Dellinger makes the following remarks:

There is nothing of special importance to be said in connection with this report further than the fact that 80 or 90 per cent of the men's tents leak; and this, taken together with the further fact that they have only camp fires for heating purposes, accounts for a great deal of catarrhal trouble among the men. This is especially true of men who are from eastern North Carolina, where a semi-tropical climate obtains. The men from the western section of the State stand the cold better. Better quarters must be provided.

CONDENSED SICK REPORT FOR OCTOBER.

Mean strength	1,090
Admissions:	
Remaining from first month	64
From command	144
Total	208
Completed cases	169
Returned to duty	96
Died	4
Otherwise disposed of	69
Total	169
Remaining on sick report:	
Hospital	18
Quarters	21
Total	39

The November report is signed by Major Dellinger with the following remarks:

Only the expected has happened this month, so to speak. The most trouble we were expecting was from influenza, pneumonia, and kindred affections. But for our timely removal from Camp Poland, Knoxville, Tenn., we must have suffered far more from these troubles. And still this advantage was somewhat mitigated by the cold wave which struck here about the time we did, so early in fact that we had not time to put up tents and provide them with floors, consequently the men suffered much. Catarrhal jaundice is still among the men. Several of the officers have been attacked. There are no deaths from this cause. Much complaint has reached this department concerning the bread supply of this camp. It was said to be deficient in quantity and quality. Several loaves were left for my inspection, probably some of the worst, but wholly

unfit for human consumption. I understand recently that the contract has been changed and have heard no further complaint. The tentage is very bad. The men have to throw their ponchos over their tents to keep out rain. Of course this is not altogether a success. This is a serious matter, and should be attended to at once, or the men must continue being seriously damaged in constitution from this source of avoidable exposure. There have been no sick in regimental hospital during the month.

CONDENSED SICK REPORT FOR NOVEMBER.

Mean strength	1,084
Admissions:	
Remaining from last month	21
From command	51
Total	72
Completed cases	51
Returned to duty	17
Died	2
Transferred to other hospitals	32
Total	51
Remaining on sick report:	
Hospital	0
Quarters	32

In the December report Major Dellinger makes the following remarks:

The entire command has been vaccinated during this month. The great majority of these vaccinations were successful. The health of the command is much improved over that of last month and continues to improve.

CONDENSED SICK REPORT FOR DECEMBER.

Mean strength	1,071
Admissions:	
Remaining from last month	21
From command	49
Total	70
Completed cases	48
Returned to duty	29
Died	2
Discharged	3
Transferred	14
Total	48
Remaining sick in quarters	22

We inspected this regiment a few days after it reached Knoxville. The statement of the surgeon that the guards were accustomed to lie on the sand and sleep at night very naïvely expresses the lack of discipline in this command. There are several points of interest in the history of this regiment. In the first place, typhoid fever appeared long before the regiment left its State encampment. Indeed, the first case of typhoid fever had its initial date July 12, seven days before the regiment was mustered into the service of the United States. The command had had no less than 16 cases of typhoid fever before it went to Knoxville. Had it remained at Fort Macon, N. C., the number of cases of typhoid fever would probably have been no less. Only one case was diagnosed typhoid fever by the regimental surgeon, and this case occurred on the 11th of October. It will be

seen, therefore, that typhoid fever had become widely spread in the regiment before it was recognized. Nineteen cases from this regiment were recognized as typhoid fever after transfer to the hospital. In all, there were 58 cases of undoubted typhoid fever in the regiment, with 7 deaths. The fact that a number of cases of typhoid fever was not larger appears to us to be interesting. As we have already seen, the location of the troops at Knoxville was exceptionally good. In fact it would seem that no better place from a sanitary standpoint could possibly have been selected. The water was unobjectionable and was abundant in quantity. We are quite thoroughly convinced that the chief agent in the distribution of typhoid fever at Knoxville was the fly, and in our opinion this regiment escaped as lightly as it did because it did not go to this general encampment until the middle of September, and the cool weather soon materially lessened the activity of the fly. In our opinion, the history of this regiment is suggestive of this one fact and nothing more. It is possible that later in the season other factors than the fly may have had something to do with the spread of typhoid fever in this and other regiments. It is probable that tents, blankets, and clothes became infected. In this way we may account for a number of cases that occurred in November. The last three cases of typhoid fever reported from this regiment had their initial date on November 19. Two of these three cases belonged to the same company; in fact, the tendency of the disease to group itself in companies is quite as marked in this command as in others. We have called attention to this regiment for the express purpose of using it as evidence of the influence of the fly in the distribution of typhoid fever. We believe that if this regiment had been sent to Chickamauga earlier in the summer it would have suffered quite as severely from typhoid fever as any other.

COMMUNICATIONS FROM THE SURGEONS OF THE THIRD NORTH CAROLINA VOLUNTEER INFANTRY.

Medical officers.

James E. Dellinger, major and surgeon, Greensboro, N. C.
Manassa T. Pope, lieutenant and assistant surgeon, Charlotte, N. C.
Marcus W. Alston, lieutenant and assistant surgeon, Asheville, N. C.

Major Dellinger sends the following communication:

I can not reply to your communication without some direct contradictions of what apparently seems fact to you, and that I do not care to do. For instance, you say in your history of our regiment that we had 16 cases of typhoid fever before we left Fort Macon, N. C. Now, according to my best knowledge and belief this is not true. There were 3 cases which occurred there, and these were at first taken for malarial fever and were so reported, but afterwards I had reason to believe them typhoid fever. With these excepted, the official reports are correct so far as the condition obtained at Macon, N. C.

At the other camps, at Knoxville and Macon, in compliance with order from the chief surgeon, all cases of continuous temperature of 102° and above for twenty-four hours, or may be forty-

eight hours, were sent to division hospital; hence the meager chance for a settled diagnosis in any case of fever at the regimental hospital, a luxury denied our regiment, the Third North Carolina Volunteer Infantry, until it reached Macon, Ga.

As to the fly theory, I am perfectly in accord, and I may say with sufficient modesty that it was advocated by me in an address before the North Carolina Teachers' Association in the early part of June, 1898, and was my faith and practice before the disaster at Chickamauga. May it not be said that we might have had more typhoid but for this practice at Fort Macon, N. C.? The official reports at other points tell the whole truth, so far as my knowledge and experience could make them true; hence there is nothing I might add to increase the accuracy of your final report.

Comment: It is barely possible that we have over-estimated the number of cases of typhoid fever in this regiment before it left North Carolina. However, from the regimental records as prepared by Major Dellinger we will give a few of these cases that we have classed as probable typhoid fever:

No. 1. Private Mitchell, Company F, malaria, July 12 to August 22.

No. 2. Corporal McMunier, Company E, malaria, August 2; still sick in hospital at Knoxville November 15.

No. 3. Private Younger, Company D, malaria, August 2; had not returned to duty December 30.

No. 4. Private Rogers, Company I, malaria, August 8; had not returned to duty December 30.

No. 5. Private Hill, Company F, diarrhea, September 11 to October 13.

No. 6. Private Ballard, Company A, malaria, September 1; still sick in hospital December 18.

These are illustrations of the cases that we have marked as probable typhoid fever in the regiment before it left North Carolina.

REPORTS FROM THE SECOND DIVISION HOSPITAL, FIRST ARMY CORPS.

The first report from this hospital covers the period from June 15 to 30, inclusive. In this report Maj. Fred R. Charlton, surgeon in charge, makes the following statement:

The prevailing diseases are malaria, measles, gastro-intestinal diseases, with quite a number of cases of ischio-rectal abscess. The cases of measles are isolated.

Typhoid fever.....	127
Malarial fever.....	255
Intestinal disorders.....	86
Other diseases.....	192
Total	660

The September report is signed by Major Baguley, and in this he makes the following statement:

The prevailing disease is typhoid fever, and it is the opinion of the surgeon in charge that many of the cases diagnosed as malarial remittent in this report should have been typhoid fever, as in no case where microscopic analysis of the blood has been made has the plasmodium been found. The cases marked enteric fever were changed to typhoid fever by direction of the surgeon in charge.

Malarial fever.....	104
Intestinal disorders.....	32
Other diseases.....	118
Total	483

The November report is signed by Major Kendall, surgeon in charge, who makes the following statements:

During the month of November, fewer cases of typhoid fever have appeared. Several cases of pneumonia have occurred, attributable perhaps to the exposure, which was considerable during the early winter before present arrangements had been completed. Later there have occurred several cases of cerebro-spinal meningitis, with one death at this hospital. The surgeons of the hospital have commented upon what seemed to all to be a fact, viz, the comparative ease with which pneumonia was borne, for though in many cases the temperature reached $104\frac{1}{2}^{\circ}$ and 105° , there were no deaths. There have been a few cases of measles in the command, the general health of which has been excellent.

CONDENSED SICK REPORT FOR NOVEMBER.

Mean strength	2,113
Typhoid fever.....	196
Malarial fever.....	12
Intestinal disorders.....	15
Other diseases.....	172
Total	395

We fear that these reports will mislead unless we call attention to the fact that cases of typhoid fever were carried over from month to month in this hospital. For instance, on the face of these reports it would appear that with a mean strength of 2,113 in November there was a much larger proportion of typhoid fever than during any other month, but, as already stated, most of these cases are carried over from preceding months.

GENERAL REMARKS CONCERNING TYPHOID FEVER IN THE SECOND DIVISION OF THE FIRST ARMY CORPS.

It seems to us more than probable that the water supply for this division during May, June, and July at Chickamauga became infected with the specific poison of typhoid fever. We think that this was most probably true of the Jay's mill well, from which the first and second brigades obtained their water supply in part, and of the Brotherton road well, from which the third brigade obtained its water supply for some time after its arrival. The location of both of these wells with reference to the camps which they supplied, together with the fact that these camps were infected, renders it much more than probable that the water of these wells became infected with typhoid fever. We are quite positive in our belief that water infection was one of the means by which typhoid fever was spread through this division while at Chickamauga. It is unfortunate that proper bacteriological studies of these waters could not have been made at the time. As has already been stated, we see no reason for believing that these wells were infected when the troops arrived. In fact, we have already given strong reasons for believing that these wells were not infected at that time. Employees about the park had long been accustomed to drink these waters and typhoid fever had not followed. The water from these wells did not introduce typhoid fever among the troops. The troops brought the disease, infected the water, and then drank it. We do not make these statements as demonstrated facts, but as the opinions which we have reached as a result of our study.

However, water was not the only means by which typhoid fever was spread among the troops of this division at Chickamauga. Like all other organizations in the park at that time, the camps of the regiments of this division became terribly polluted. Sinks could not be properly constructed. Their contents were not kept covered or even kept within bounds, but overflowed

and polluted the soil about them. Flies swarmed alternately about the sinks and the mess tents. Men carried infected filth on their persons and in their clothing. Tents, blankets, and equipage in general became infected, and when this division moved to Knoxville it carried with it innumerable cultures of the typhoid bacillus.

At Knoxville the water supply was not contaminated, but the infection brought in the bodies of the men and in their clothing and equipage was disseminated by flies, and the epidemic continued until the coming of cold weather destroyed these pests, which had inflicted greater loss upon the American soldiers than the arms of Spain had.

The fact that the epidemic of typhoid fever at Knoxville disappeared with the approach of cool weather—at a time when typhoid fever is generally found to be most rife in civil practice—is to us a strong confirmation of our belief that flies had much to do with the dissemination of this infection.

FIFTH PENNSYLVANIA VOLUNTEER INFANTRY.

First Brigade, Third Division, First Army Corps.

This regiment, consisting of eight companies, assembled at Mount Gretna, Pa., and was mustered into the service of the United States May 11. On May 17 it departed for Chickamauga Park, Ga., arriving May 20.

The May report is signed by Maj. Andrew S. Stayer, who makes no comments.

CONDENSED SICK REPORT FROM MAY 11 TO MAY 31, INCLUSIVE.

Mean strength.....	639
Admissions—From command.....	15
Completed cases.....	13
Returned to duty.....	13
Remained on sick report:	
Hospital	2
Quarters	0

The June report is signed by Lieut. Samuel P. Glover, acting regimental surgeon, who makes the following statement:

Typhoid fever and acute diarrhea have been the prevailing diseases. For the former extra policing of the sinks, closets, and care of the mess tents, with boiling of the water as far as possible, have been attended to. Chloride of lime is used as freely as it is supplied. Watching the sutler's tents helps to check the diarrhea. A regimental hospital was maintained until June 15. From that time on patients were sent to the division hospital.

Hospital	8
Quarters	10
Completed cases.....	131

The July report is signed by Lieutenant Glover, who states:

The camp has been on low ground since May 20. Requests were sent in for a change of location during June and July. With the three weeks of heavy rains nearly every day in July, the ground was damp and muddy and at times during heavy showers received the washings from the camp above. Diarrhea and typhoid fever were the prevailing diseases, with many of a malarial nature. The water was ordered boiled and filtered; sinks were dug frequently and carefully policed, but filled up rapidly with water from the damp soil. Chloride of lime and ordinary unslaked lime have been used as freely as supplied.

Quarters	113

The August report is signed by Major Stayer, with the following comments:

The command was in Camp George H. Thomas, Chickamauga Park, near Alexandria Bridge, from August 1 to 12, when it removed to the new camp 2 miles west on a higher piece of ground.

The prevailing diseases in this regiment for this month have been typhoid fever, intermittent and remittent fevers, and diarrhea. The cause of these diseases was largely due to the unhealthy location of the camp near Alexandria Bridge. In the first place, this camp was in a deep shade; in the second place, it was very low and flat, and had no natural drainage, so that the slightest moisture kept the streets continuously muddy. The latrines and kitchen sinks had to be dug in a clay, which is absolutely devoid of porosity. This camp received the surface water of the Twelfth Minnesota Volunteer Infantry, which was located south and above our camp. The diarrheas have been mostly caused by the men purchasing pastries, etc., beyond the camp limits of the regiment. I made verbal objection to the occupation of the first camp site for this regiment upon my arrival, May 20, 1898. Moreover, every few days I recommended the removal of the camp, and while acting as surgeon of the regiment I made recommendation for its removal, July 11 and 12. To prevent the sale of pastries, the guards were instructed to arrest all peddlers. I have also recommended the change of location every ten days. Lime has been used as a disinfectant from August 4.

Quarters	31

It should have been stated that during July and the first part of August this regiment was filled out by the addition of four new companies. This regiment left Chickamauga Park, Ga., August 23, 1898, and proceeded to Lexington, Ky.

The September report is signed by Major Stayer, with the following statement:

This command left Camp Hamilton, Ky., September 17, 1898, as per telegraphic order from War Department. The following companies composing it moved to their several rendezvous, as follows:

Company A, Huntingdon, Pa.; Company B, Bellefonte, Pa.; Company C, Hollidaysburg, Pa.; Company D, Blairsville, Pa.; Company E, Clearfield, Pa.; Company F, Indiana, Pa.; Company G, Lewistown, Pa.; Company H, Johnstown, Pa.; Company I, Somerset, Pa.; Company K, Wellsboro, Pa.; Company L, Clearfield, Pa.; Company M, Gettysburg, Pa.

Each company was granted a thirty-days' furlough, with a view of mustering out. Most of the companies arrived at the above-mentioned places September 18, 1898.

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength	1,294

From command	169
Total to be accounted for	199

Returned to duty.....	134
Transferred to other hospitals.....	24
Otherwise disposed of	41
Completed cases.....	199

The October report is signed by Major Stayer, with the following remarks:

The prevailing diseases are typhoid and remittent fevers, caused in many cases by the carelessness of the men themselves while in camp, as well as when at home on furlough. The furlough of the regiment having expired October 18, the regiment was on duty from said date until November 1, in order that it might take part in the Peace Jubilee in Philadelphia, October 26, 27, and 28. The regiment moved to Philadelphia October 25, and after the ceremonies the various companies returned to their armories October 29, 1898. The casualties on the Philadelphia trip was one man killed while crossing the railroad track at Tyrone, Pa.

CONDENSED SICK REPORT FOR OCTOBER.

Completed cases.....	305

The November report is signed by Major Stayer, who states:

There is nothing of special interest in the medical department of this regiment. The companies composing the regiment were located at the places already mentioned.

CONDENSED SICK REPORT FOR SEVEN DAYS IN NOVEMBER.

Mean strength	1,376
Admissions:	
Remaining from last month.....	38
From command	3
Total to be accounted for	41
Died	1
Completed cases.....	41

For want of space we will not add a list of the probable cases of typhoid fever in this regiment, but will submit only a summary.

There is no doubt that this regiment reached Chickamauga Park, Ga., infected with typhoid fever. The first reported case is that of a private from Company D; the initial date of this case was May 19; the disease was diagnosed typhoid fever; the patient then was sent to Fort Thomas July 6, and was discharged from this hospital October 18.

During the month of June there were 11 cases. Of these, 1 had its initial date June 10, another followed on June 11; there were 2 cases June 16; 1, June 20; 1, June 24; 1, June 26; 2, June 27, and 2 June 30.

The number of cases for each month may be given as follows:

May	1	October	10
June	11	November	1
July	72		
August	142	Total	338
September	101		

SUMMARY.

Assembled at Mount Gretna, Pa., April 27, 1898.	
Mustered into United States service May 11, 1898.	
Arrived at Chickamauga Park May 20, 1898.	
Strength on arrival, 639.	
Date of first case of probable typhoid fever, May 19, 1898.	
Date of first case of recognized typhoid fever, May 19, 1898.	
Left Chickamauga Park August 23, 1898.	
Strength on departure, 1,291.	
Number of cases of probable typhoid fever developed at Chickamauga	182
Arrived at Lexington, Ky., August 23, 1898.	
Left Lexington, Ky., September 17, 1898.	
Number of cases of probable typhoid fever developed at Lexington, Ky.	103
The companies of this regiment dispersed to their respective armories September 17, 1898.	
Number of cases of probable typhoid fever developed in the companies after dispersion	53
Total number of cases of probable typhoid fever developed in the Fifth Pennsylvania Volunteer Infantry ..	338
These 338 cases were diagnosed as follows:	
Typhoid fever	152
Malaria	141
Diarrhea	39
Indigestion	6
Total	338

Several questions of interest concerning this regiment might be asked. One of these is as follows: Did the four companies that first reached Chickamauga in July suffer as greatly from typhoid fever as did the other companies? The distribution of probable cases of typhoid fever among the companies in this regiment, together with the date of the first case in each company, may be seen in the following table:

Company.	Date of first case.	Number of cases.
A	July 7	28
B	June 24	26
C	June 16	30
D	May 19	28
E	June 27	34
F	June 10	33
G	June 20	33
H	June 11	22
I	July 25	30
K	July 22	32
L	July 26	29
M	July 21	10

It will be seen from the above figures that all the original companies were infected with typhoid fever before the arrival of the recruited companies. The average number of cases in the eight original companies for the whole time is 29.25, while that in the four recruited companies is 25.25, but the smaller average in the recruited companies is due to the very small num-

ber in Company M, consequently it would not be wise to place great stress upon the small difference in the averages. We have not been able to ascertain the date of the arrival of the recruited companies, nor do we know that all of them arrived at the same time. The probabilities are that they did not. If all of the recruited companies had arrived early in July the mean strength for that month would have been greater than that given in the report for that month. From the dates given it is shown that Company L was the last to become infected with typhoid fever, and notwithstanding this fact it averaged with the companies that had been in the service since May. We did not expect that the answer to the question asked concerning the distribution in the companies would be other than it turns out to be. The new companies came into a polluted camp and probably were quite as susceptible to the infection as those who had been there longer. Before July 22 there had already been in the eight original companies 30 cases of probable typhoid fever. After July 22, the initial date of the first case among the recruits, the average among the original companies was 25.5, practically the same as the average among the recruited companies.

Another question of interest concerns the relative number of cases of typhoid fever in this regiment and in the Twelfth Minnesota. By referring back to the monthly sick reports it will be seen that Major Stayer, of the Fifth Pennsylvania, complained earnestly and properly of the location of the first camp of this regiment. Among other things he states that the camp of the Fifth Pennsylvania received the drainage from that of the Twelfth Minnesota. We can state quite positively that the Pennsylvania regiment did not receive its first infection from the Minnesota regiment, because the former reached Chickamauga with a case of typhoid fever already developed. However, the Twelfth Minnesota certainly became widely infected, and it is to be regretted that the camp of the Pennsylvania regiment was not moved earlier than it was.

The curve of typhoid fever in this regiment is peculiar on account of the break of just one week in the middle of July (July 13 to 20) during which time not a case was reported, while during both the preceding and subsequent weeks there were one or more cases reported each day. This would indeed be of great interest did we know that the data given are correct, but we can not know this. The break is more likely due to an interruption in bookkeeping than to an actual interruption in cases of fever. It is probable that one or more of the 8 cases reported July 22 had their true initial date earlier.

It certainly will be of interest to inquire into the occurrence of typhoid fever among the companies of this regiment after their dispersion. From such an inquiry we may be able to get information concerning the extent to which the infection prevailed among the men after they went to their homes. This regiment,

as has been stated, divided up into companies, and each company started for its home town September 17, 1898. During the following week, as the records show, the number of new cases reported from the scattered companies was nearly twice as great as it had been for the regiment as a whole during the last week of its stay at Lexington. With the beginning of the second week after dispersion typhoid fever suddenly and greatly decreased, and from this time on for more than a month after the dispersion occasional cases developed. Can it be possible that the men in this regiment who developed typhoid fever after the middle of October became infected before they left Lexington? In other words, may the period of incubation in typhoid fever be prolonged to from four to six weeks? Quite obviously this question can not be answered from the data at our command with scientific certainty, but there are reasons for believing that it may be answered affirmatively. These men left an infected camp September 17, and more than four weeks later some of them developed typhoid fever. The infection which developed these late typhoids may have been brought from Lexington or it may have been found at the homes of the men or on the way to their homes. The six cases on and after October 15 were distributed through five companies. Let us state the question fairly, as follows: Six men exposed to typhoid infection at Lexington, Ky., go to five different places in Pennsylvania, at none of which, presumably, was there an epidemic of typhoid fever, and during the fifth week after leaving the infected place these six men developed typhoid fever. Does it not seem probable that the infection that developed in these men was obtained at the place where all were exposed?

We believe that this is the most satisfactory explanation. We have collected several similar cases bearing on this point. A hospital steward, who had been caring for typhoid-fever patients at Ponce, P. R., left that place and went to his home, a small town in the interior of Pennsylvania, where there had been no cases of typhoid fever for at least a year before and where no one but he developed the disease during the fall of 1898. During the fifth week after leaving Ponce he became ill with typhoid fever. Is it not more than probable that in this case the infection was brought from the typhoid-fever hospital at Ponce? Other like cases have come to our knowledge. English army officers report similar cases also. For instance, take the histories of men exposed to typhoid fever in upper Egypt. These men have returned to England and have developed typhoid fever six weeks after leaving the infected locality. However, in our opinion, this does not prove that the period of incubation of typhoid fever, properly speaking, can be prolonged as greatly as indicated in these statements. These men may have left an infected locality bearing the typhoid infection with them on their persons, under their finger nails, in their

hair or on their clothing or in their baggage, and some time later this infection may have found its way into the alimentary canal. We have gone into this inquiry for the purpose of recommending the disinfection of the person and the personal effects of those exposed to typhoid infection rather than for the purpose of attempting to determine how long the period of incubation for this disease may be extended. At any rate it is safe to say that without such disinfection one who has lived in a camp in which typhoid fever has prevailed is liable to develop this disease any time within six weeks after leaving such a camp.

The relative number of cases developed in the Fifth Pennsylvania and Twelfth Minnesota regiments, closely associated, may be of interest. These regiments arrived at Chickamauga Park on the same day; they were brigaded together; they left Chickamauga Park on the same day; both went to Lexington, Ky., and remained at that place practically the same time. On leaving Lexington the Pennsylvania regiment broke up into companies and went to twelve small towns in Pennsylvania. The Minnesota regiment went in a body to New Ulm and remained there about one month. In making this comparison we find that the mean strength in these two regiments from May to October was about the same. While the Pennsylvania regiment went to Chickamauga with only eight companies, and thus reduced its average strength for the six months to 1,004, the Minnesota regiment was so reduced by illness that its mean strength for the six months was only 1,071. We must therefore conclude that the Minnesota regiment suffered more severely, measured by the number of cases of probable typhoid fever, than did the Pennsylvania regiment. This difference would probably be more marked had we not been compelled to omit altogether from our list of probable cases the 101 cases left incomplete at the close of the July report of the Minnesota regiment. Pushing this comparison further, it appears that the Minnesota regiment suffered more severely at Chickamauga and the Pennsylvania regiment more severely after leaving Chickamauga. But it must be remembered that the mean strength of the Minnesota regiment while at Chickamauga was much greater than that of the Pennsylvania regiment, and that in this particular the position of the regiments was reversed later. So far as a comparison of these regiments gives us information, there was apparently no advantage to the Pennsylvania regiment in breaking up into companies; but stress must not be placed on this point, because nearly one-third of the Minnesota regiment had been disabled by sickness before September 1, 1898, and it is probable that most of the susceptible persons in this regiment had typhoid fever.

Both the Fifth Pennsylvania and the Twelfth Minnesota had two camp sites at Chickamauga. The first one, occupied by the Fifth Pennsylvania, became horribly polluted. In his report to the Surgeon-General

on the sanitary condition of Camp Thomas, August 7, 1898, Lieutenant-Colonel Woodhull states:

In the Fifth Pennsylvania the camp site was lower than the sinks, and during recent rains the sinks overflowed and flooded the camp. The sick report of this regiment was 31 per cent, including 25 cases of recognized typhoid fever and 15 supposed to be of that disease, with the sick rate increasing.

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
1898.				
Blakely, Joseph A....	Pvt., F.	Aug. 25	Chickamauga, Ga....	Typhoid.
Bottom, Charles W....	Pvt., G.	Sept. 13	Camp Thomas, Ga....	Do.
Dibble, Wm. G.	Pvt., K.	Aug. 31	Chickamauga, Ga....	Do.
Enos, Wilson G.	Pvt., I.	Sept. 18	Pittsburg, Pa.	Do.
Garis, Charles	Col. Sgt., B	Aug. 28	Chickamauga, Ga....	Do.
Hazlett, Ernest M....	Pvt., K.	Aug. 30	Division hospital, Chickamauga, Ga.	Do.
Homan, George W....	Pvt., H.	June 27	Camp Thomas, Ga....	Do.
Mahaffey, James T....	Pvt., E.	Sept. 10	Lexington, Ky. (St. Joseph's Hospital).	Do.
Mays, Frank E.	Artl., E.	Nov. 8	Oscola Mills, Pa.	Do.
Robinson, Joseph C....	Pvt., C.	Aug. 12	Chickamauga, Ga....	Do.
Stonebreaker, Wm. F.	Pvt., E.	Sept. 29	Indiana, Pa.	Do.
Schlitter, Henry L....	Pvt., L.	Sept. 3	Pittsburg, Pa.	Do.
Steffy, Wm. M.	Sgt., M.	Aug. 18	Camp Thomas, Ga....	Do.
Taylor, Frank H.	Bund, B.	July 7	Chickamauga, Ga....	Do.
Thomas, John	Pvt., B.	Sept. 18	Camp Hamilton, Ky..	Do.
Woomer, Francis M....	Pvt., G.	July 22	Place not given	Do.

♂Major Stayer reports that this man died of cerebro-spinal meningitis.

It will be seen that all of these 16 deaths were due to typhoid fever. Sixteen among 328 cases gives a death rate of 4.73 per cent.

Percentage of deaths among 152 recognized cases of typhoid fever equals 10.52.

COMMUNICATIONS FROM THE SURGEONS OF THE FIFTH PENNSYLVANIA.

Medical officers.

Andrew S. Stayer, major and surgeon, Altoona, Pa.

Robert G. H. Hayes, lieutenant and assistant surgeon, Bellefonte, Pa.

Samuel P. Glover, lieutenant and assistant surgeon, Altoona, Pa.

Lieutenant Hayes states with reference to the camp at Chickamauga:

Our camp was on low ground and received the surface washings from the near-by camps and adjacent country. It was impossible to keep our sinks in good condition. We obtained our drinking water from a well and from Chickamauga Creek.

Major Stayer has sent us a communication, from which we make the following extracts:

On the second day after our arrival at Chickamauga we recognized our first case of typhoid fever in the person of William Patrick, who arrived at Mount Gretna with the first batch of recruits from his home near Blairsville, Pa., May 1, 1898, and no doubt brought the infection from his home. This patient was kept completely isolated from the command in the regimental hospital outside of the guard line. All his excretions were promptly buried and the vessels used disinfected with a solution of bichloride of mercury. On June 15 he was transferred to the Third Division hospital, and later he was sent to Fort Thomas, Ky.

The location of our first camp at Chickamauga was bad—the worst of any in Chickamauga Park. To our right on the hillside, at least 50 feet above the level of our camp, was the Twelfth Minnesota Volunteer Infantry, the surface drainage from which passed through our camp. To our rear and at least 15 feet above the level of the camp were our latrines. The natural drainage from this point also passed through our camp. On our right was a stinking pigsty, in front of what was then general headquarters. On our front flowed a slow, sluggish stream carrying the surface water from at least twenty regiments; the stench that greeted our nostrils from

this stream was almost unbearable. Great care was taken to keep this place as healthy as possible. The latrines were filled in three times a day with earth by the officer of the day. I might add that although the quarters of the officers and men were properly ditched, yet when the hard rains came water flowed into the tents to the depth of 5 or 6 inches. This regiment was obliged to maintain a regimental hospital until sufficient tentage could be secured to enlarge the division hospital, which was not accomplished until August 22, when some 62 patients were transferred to division hospital.

Our second camp at Chickamauga, to which this regiment moved August 12, was on a knoll 2 miles away from the old camp, and was an ideal location so far as surface drainage was concerned, but the ground was clayey, without porosity, and the limestone rock lay within 2 feet of the surface. Notwithstanding these difficulties, our latrines were dug from 6 to 8 feet deep by blasting out rock. Sheds were built over these excavations, forming first-class wooden closets, all tightly closed, effectually shutting out the light, thus excluding the flies, which pest seemed to be a considerable source of infection. Lime was used extensively as a disinfectant, a barrel being placed in each closet and guards located near them to enforce care of the sinks. A larger number of typhoid cases occurred in the new camp than in the old one, but the infection undoubtedly came from the old camp.

I think that the number of recognized cases of typhoid fever has been placed too high. Before sending the register of sick and wounded to Washington I went over the diagnoses, and my estimate was only 90 cases of recognized typhoid fever and 140 cases of malaria.

The camp at Lexington, Ky., was, sanitarily, considered excellent. It is true that quite a number sickened in this camp, but the majority of the cases developed here were of the malarial character, having distinctive exacerbations with characteristic symptoms of blue lips and finger nails during the chills. When the regiment left Camp Hamilton for home on furlough, all sick in the hospital were taken with us and left at Johnstown, Altoona, and in other hospitals near the homes of the men, except John Thomas, who died the same day we left, and Milton Dunn, who preferred to remain in the division hospital.

I am satisfied that the new recruits were more susceptible to typhoid fever than the men who had been with us from the first. This regiment first started out with 55 men to a company; then at Mount Gretna the companies were recruited to 75, finally at Chickamauga, in the latter part of June, all companies were recruited to 100 men. My observations lead me to assert that a larger number of the new men contracted the disease. The material selected in recruiting was not as good as that originally in the regiment. The fact that Company M suffered so little in comparison with the other companies may have been due to the fact that the captain of this company was an old officer who had had experience in the civil war and who cared for his men admirably.

The extensive infection of the Twelfth Minnesota Volunteer Infantry might have been due to the fact that this regiment supported a canteen, while the Fifth Pennsylvania had none.

The men who developed typhoid fever after reaching their homes may have acquired the disease at their homes, inasmuch as typhoid fever was largely prevalent throughout this portion of Pennsylvania in the fall of 1898.

TWELFTH MINNESOTA VOLUNTEER INFANTRY.

First Brigade, Third Division, First Army Corps.

In the May report Captain Caine makes the following statement:

The Twelfth Regiment Minnesota Volunteer Infantry was mustered into United States service May 6 and 7 at Camp Ramsey, St. Paul, Minn. It remained at Camp Ramsey eighteen days. During the greater part of this time it was very windy and the nights

were cold. Many soldiers suffered from catarrhal inflammation of the nose, throat, and bronchial mucous membrane, and several cases of ophthalmia developed. There were also cases of measles, pneumonia, and meningitis. En route from Camp Ramsey to Camp George H. Thomas, from May 16 to 19, inclusive, 3 cases of measles developed. These were quarantined at Rossville, Tenn.

Here at Chickamauga the regiment is fairly located. The topography of camp ground, however, is rough and will render it difficult to establish perfect drainage. The unsuitable rations and inexperienced cookery have been the cause of gastro-intestinal disturbances. The camp is thoroughly policed and all hygienic measures have been adopted.

CONDENSED SICK REPORT FROM MAY 6 TO MAY 31, INCLUSIVE.

Mean strength	1,032
Diarrhea.....	35
Indigestion	47
Dysentery	3
Other diseases.....	101
Total	186

In the June report Assistant Surgeon Rowe makes the following statement:

Intestinal disorders, diarrhea, and dysentery have been the prevailing diseases, due principally to indiscretions in diet. Typhoid and malarial fevers have also prevailed. The use of boiled water for drinking purposes and strict attention to hygienic conditions have been instituted for their control. A few cases of measles and mumps have developed, but strict quarantine measures being adopted there have been no others affected.

CONDENSED SICK REPORT FOR JUNE.

Mean strength	1,032
Indigestion	111
Diarrhea.....	80
Dysentery	1
Undetermined fever	8
Other diseases.....	126
Total	326

The discrepancy between the statement of Assistant Surgeon Rowe and the sick record must be evident. The surgeon states that typhoid and malarial fevers have prevailed during the month, and yet neither typhoid fever nor malaria appear on the sick report.

There is no comment made on the July report.

CONDENSED SICK REPORT FOR JULY.

Mean strength	1,308
Indigestion	331
Diarrhea.....	41
Undetermined fever	41
Malarial fever.....	18
Intermittent malaria.....	2
Remittent malaria.....	3
Dysentery	1
Typhoid fever.....	11
Other diseases.....	138
Total	586

This report closes with 101 incomplete cases. These incomplete cases are not carried on to the report for August. Consequently, there is nowhere in the regi-

mental records, so far as we can find, any evidence of their disposition. How many, if any, of these had typhoid fever we can not know.

The August report is also without comment.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength	1,232
Indigestion	118
Diarrhea.....	16
Malaria.....	326
Undetermined fever	3
Other diseases.....	317
Total	780

This regiment left Chickamauga Park August 22 and reached Lexington, Ky., August 23. Captain Caine makes the following statement:

In consequence of malarial infection resulting from encampment of three months in Chickamauga Park many officers and men, immediately after arrival of the regiment at Lexington, became ill with typhoid, malarial fever, and dysentery, which diseases have continued from the date of the arrival of the regiment until the date of making this report. The sanitary conditions of Camp Hamilton and the climatic conditions and location of the same are excellent.

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength	912
Indigestion	33
Diarrhea.....	73
Malaria.....	75
Typhoid fever.....	2
Undetermined fever	12
Other diseases.....	119
Total	314

This regiment left Camp Hamilton, Ky., September 15, and reached New Ulm, Minn., September 17, and immediately went into camp at the Fair Grounds. The sick brought with the regiment were placed in St. Alexander Hospital, New Ulm, for treatment. Those taken sick after the arrival of the regiment at New Ulm were treated in the regimental hospital; however, the more serious cases of these were also sent to St. Alexander Hospital. The surgeon states that the sickness existing during the month of September was due to malarial infection introduced into the regiment at Camp Thomas. The location of the camp at New Ulm was said to be excellent. The water was also said to be excellent, but no particulars are given.

On account of the incompleteness of the records of this regiment it is quite impossible to be certain concerning the number of typhoid cases. However, the following list gives the best information that we can obtain upon this subject:

No. 1. Company D: Indigestion, May 20 to 31.

No. 2. Company D: Indigestion, May 20 to 31.

These two cases diagnosed as "indigestion" were so much more prolonged than any other of the cases of

the same diagnosis during that month that it is possible they may have been typhoid fever. On this point, however, we do not wish to express any positive opinion.

No. 3. Company D: Undetermined fever, June 1; furloughed from division hospital July 12. In hospital this case was diagnosed typhoid fever.

No. 4. Company D: Typhoid fever, June 7; furloughed September 8. On the regimental record it seems that this man was returned to duty July 5, while the hospital record shows that he was sick with typhoid fever at that time and was not furloughed until September 8.

No. 5. Company I: Indigestion, June 8; still sick in hospital June 30.

No. 6. Company C: Diarrhea, June 17; furloughed from division hospital July 27. In hospital this case was diagnosed typhoid fever.

No. 7. Company C: Diarrhea, June 19; still sick in hospital July 31.

No. 8. Company C: Indigestion, June 19; still sick July 31.

No. 9. Company M: Typhoid fever, June 19; still sick September 15.

No. 10. Company E: Diarrhea, June 21; discharged from division hospital July 19. In hospital this case was diagnosed typhoid fever.

No. 11. Company M: Typhoid fever, June 21; furloughed from Leiter Hospital July 27.

No. 12. Company I: Undetermined fever, June 21; furloughed from Fort Thomas September 22. In hospital this case was diagnosed typhoid fever.

No. 13. Company I: Remittent malaria, June 22 to July 21.

No. 14. Company E: Indigestion, June 22 to July 29.

No. 15. Company E: Intermittent malaria, June 22 to July 9.

No. 16. Company G: Typhoid fever, June 23; furloughed July 15.

No. 17. Company E: Typhoid fever June 23 to July 26.

No. 18. Company K: Indigestion, June 24 to July 15.

No. 19. Company E: Remittent malaria, June 24 to July 26.

No. 20. Band: Malaria, June 24; furloughed July 30.

No. 21. Company F: Indigestion, June 25; furloughed July 15.

No. 22. Company H: Indigestion, June 26; furloughed from Leiter Hospital August 12. In hospital this case was diagnosed typhoid fever.

No. 23. Company E: Indigestion, June 26 to July 31.

No. 24. Company E: Typhoid fever, June 28 to July 29.

No. 25. Company E: Typhoid fever, June 28 to July 24.

No. 26. Company K: Indigestion, June 29; still sick July 31.

No. 27. Company C: Indigestion, June 29; furloughed from Fort Thomas October 17. In hospital this case was diagnosed typhoid fever.

No. 28. Company E: Undetermined fever, June 29; furloughed from Fort Thomas September 5. In hospital this case was diagnosed typhoid fever.

No. 29. Company E: Indigestion, June 29; furloughed from Fort Thomas September 11. In hospital this case was diagnosed typhoid fever.

No. 30. Company not given: Colitis, June 29 to July 25.

No. 31. Company A: Typhoid fever, June 30; still sick July 31.

No. 32. Company C: Diarrhea, June 30; furloughed from Leiter Hospital August 12. In hospital this case was diagnosed typhoid fever.

No. 33. Company E: Indigestion, July 1; furloughed from Fort Thomas September 15. In hospital this case was diagnosed typhoid fever.

No. 34. Company E: Indigestion, July 2; furloughed from Fort Thomas September 5. In hospital this case was diagnosed typhoid fever.

No. 35. Company E: Indigestion, July 2; furloughed from Fort

Thomas in September. In hospital this case was diagnosed typhoid fever.

No. 36. Company D: Undetermined fever, July 2; still sick August 31.

No. 37. Company E: Undetermined fever, July 3; furloughed from Fort Thomas September 16. In hospital this case was diagnosed typhoid fever.

No. 38. Company I: Undetermined fever, July 3; still sick August 31.

No. 39. Company E: Indigestion, July 4; still sick in division hospital July 31.

No. 40. Company E: Indigestion, July 4; sent to Fort Thomas July 25. Here the disease was diagnosed typhoid fever.

No. 41. Staff: Undetermined fever, July 4; sick in St. Vincent's hospital at Chattanooga July 31.

No. 42. Company M: Undetermined fever, July 5; died at Fort Thomas July 11.

No. 43. Company E: Indigestion, July 5; still sick in division hospital July 31.

No. 44. Company K: Diarrhea, July 5 to 22.

No. 45. Company L: Indigestion, July 5; furloughed July 22.

No. 46. Company E: Indigestion, July 5; still sick in division hospital July 31.

No. 47. Company A: Undetermined fever, July 6; still sick in division hospital July 31.

No. 48. Company A: Indigestion July 6; still sick August 31.

No. 49. Company I: Sent to Fort Thomas without diagnosis July 6. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 15.

No. 50. Company M: Indigestion, July 6; still sick in division hospital July 31.

No. 51. Band: Indigestion, July 6; still sick in division hospital July 31.

No. 52. Company A: Sent to Fort Thomas without diagnosis July 6. Here the disease was diagnosed typhoid fever, and the patient was furloughed October 22.

No. 53. Company C: Sent to Fort Thomas without diagnosis July 6. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 5.

No. 54. Company G: Colitis, July 7; still sick in Leiter Hospital July 31. In hospital this case was diagnosed typhoid fever.

No. 55. Company C: Indigestion, July 7; furloughed from Leiter Hospital August 10. In hospital this case was diagnosed typhoid fever.

No. 56. Company G: Indigestion, July 7; still sick August 31.

No. 57. Company I: Indigestion, July 7; still sick July 31.

No. 58. Company H: Undetermined fever, July 8; furloughed from Leiter Hospital September 8.

No. 59. Company E: Undetermined fever, July 8; still sick at Fort Thomas July 31.

No. 60. Company K: Indigestion, July 8; still sick in division hospital July 31.

No. 61. Company G: Indigestion, July 8; still sick in division hospital July 31.

No. 62. Company E: Undetermined fever, July 8; still sick at Fort Thomas July 31. In hospital this case was diagnosed typhoid fever.

No. 63. Company E: Undetermined fever, July 8; still sick in division hospital July 31.

No. 64. Company G: Indigestion, July 9; still sick in division hospital July 31.

No. 65. Company I: Indigestion, July 9; still sick July 31.

No. 66. Company G: Sent to division hospital without diagnosis July 10. Here the disease was diagnosed typhoid fever and the patient was furloughed September 8.

No. 67. Company L: Indigestion, July 10; still sick in division hospital July 31.

No. 68. Company E: Undetermined fever, July 10; still sick at

Fort Thomas July 31. In hospital this case was diagnosed typhoid fever.

No. 69. Company E: Undetermined fever, July 10; still sick at Fort Thomas July 31. In hospital this case was diagnosed typhoid fever.

No. 70. Company M: Indigestion, July 10; still sick in division hospital July 31.

No. 71. Company M: Indigestion, July 11; still sick in division hospital July 31.

No. 72. Company H: Indigestion, July 11; furloughed from division hospital September 25. In hospital this case was diagnosed typhoid fever.

No. 73. Company K: Indigestion, July 11; still sick August 31.

No. 74. Company C: Indigestion, July 11 to 31.

No. 75. Company M: Indigestion, July 12; still sick July 31.

No. 76. Company A: Undetermined fever, July 13; still sick in quarters July 31.

No. 77. Company A: Undetermined fever, July 13; still sick in division hospital July 31.

No. 78. Company A: Indigestion, July 13; still sick in division hospital July 31.

No. 79. Band: Indigestion, July 13; still sick in Leiter Hospital July 31. In hospital this case was diagnosed typhoid fever.

No. 80. Company M: Indigestion, July 14; furloughed from Leiter Hospital September 13. In hospital this case was diagnosed typhoid fever.

No. 81. Company L: Indigestion, July 14 to 28.

No. 82. Company M: Indigestion, July 14 to 30.

No. 83. Company D: Undetermined fever, July 14; furloughed from Leiter Hospital August 16. In hospital this case was diagnosed typhoid fever.

No. 84. Company B: Indigestion, July 14; still sick in quarters July 31.

No. 85. Company E: Indigestion, July 14; still sick in division hospital July 31.

No. 86. Company H: Undetermined fever, July 14; still sick in division hospital August 31.

No. 87. Company G: Undetermined fever, July 14; furloughed from Leiter Hospital August 18. In hospital this case was diagnosed typhoid fever.

No. 88. Band: Undetermined fever, July 14; still sick in division hospital July 31.

No. 89. Company I: Indigestion, July 15; still sick at Fort Thomas July 31. In hospital this case was diagnosed typhoid fever.

No. 90. Company I: Undetermined fever, July 15; still sick at Fort Thomas July 31. In hospital this case was diagnosed typhoid fever.

No. 91. Company H: Undetermined fever, July 15; furloughed from Leiter Hospital August 16. In hospital this case was diagnosed typhoid fever.

No. 92. Company F: Diarrhea, July 15; still sick in division hospital July 31.

No. 93. Company C: Undetermined fever, July 15; still sick at Fort Thomas July 30. In hospital this case was diagnosed typhoid fever.

No. 94. Company M: Undetermined fever, July 16; still sick in quarters August 31.

No. 95. Company B: Indigestion, July 16; still sick in Leiter Hospital July 31. In hospital this case was diagnosed typhoid fever.

No. 96. Company D: Undetermined fever, July 16; furloughed from Leiter Hospital September 6. In hospital this case was diagnosed typhoid fever.

No. 97. Company A: Undetermined fever, July 16; still sick August 31.

No. 98. Company E: Malaria, July 16; still sick August 31.

No. 99. Company E: Undetermined fever, July 16; furloughed from Leiter Hospital August 23. In hospital this case was diagnosed typhoid fever.

No. 100. Company I: Undetermined fever, July 17; still sick in Leiter Hospital July 31. In hospital this case was diagnosed typhoid fever.

No. 101. Company C: Malaria, July 17; still sick in division hospital July 31.

No. 102. Company I: Undetermined fever, July 17; still sick at Fort Thomas July 31. In hospital this case was diagnosed typhoid fever.

No. 103. Company M: Undetermined fever, July 17; still sick in division hospital July 31.

No. 104. Company M: Undetermined fever, July 17; still sick in Leiter Hospital July 31. In hospital this case was diagnosed typhoid fever.

No. 105. Company A: Undetermined fever, July 17; furloughed from Leiter Hospital September 6. In hospital this case was diagnosed typhoid fever.

No. 106. Company M: Undetermined fever, July 17; died in Leiter Hospital August 13. In hospital this case was diagnosed typhoid fever.

No. 208. Company D: Malaria, August 15; furloughed from division hospital August 30. In hospital this case was diagnosed typhoid fever.

No. 209. Company I: Indigestion, August 15; still sick September 30.

No. 210. Company K: Malaria, August 15; furloughed from division hospital August 30. In hospital this case was diagnosed typhoid fever.

No. 211. Company B: Malaria, August 15; still sick November 2.

No. 212. Company L: Malaria, August 15; furloughed August 29.

No. 213. Company H: Malaria, August 15; furloughed September 14 from division hospital.

No. 214. Company F: Malaria, August 15; still sick September 30.

No. 215. Company D: Malaria, August 16; still sick September 30.

No. 216. Company B: Sent to division hospital August 16 without diagnosis. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 5.

No. 217. Company I: Malaria, August 16; still sick September 30.

No. 218. Company C: Malaria, August 16; still sick September 30.

No. 219. Company L: Malaria, August 16; still sick September 30.

No. 220. Company G: Malaria, August 16; still sick September 30.

No. 221. Company H: Sent to division hospital August 16 without diagnosis. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 8.

No. 222. Company I: Malaria, August 16; furloughed from division hospital August 30. In hospital this case was diagnosed typhoid fever.

No. 223. Company L: Malaria, August 16; still sick in quarters August 31.

No. 224. Company L: Malaria, August 16; still sick in quarters August 31.

No. 225. Band: Sent to Sternberg Hospital August 16 without diagnosis. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 8.

No. 226. Company G: Sent to Sternberg Hospital August 16 without diagnosis. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 2.

No. 227. Company F: Malaria, August 16; still sick September 30.

No. 228. No company: Sent to Sternberg Hospital August 16 without diagnosis. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 18.

No. 229. Company E: Malaria, August 16; still sick September 30.

No. 230. Company D: Sent to Sternberg Hospital August 16 without diagnosis. Here the disease was diagnosed continued malaria, and the patient was furloughed September 23.

No. 231. Company F: Malaria, August 16; furloughed from division hospital September 20. In hospital this case was diagnosed typhoid fever.

No. 232. Company G: Sent to Sternberg Hospital August 16 without diagnosis. Here the disease was diagnosed typhoid fever, and the patient was furloughed August 25.

No. 233. Company D: Malaria, August 16; still sick September 30.

No. 234. Company F: Malaria, August 17; furloughed from division hospital August 30. In hospital this case was diagnosed typhoid fever.

No. 235. Company F: Malaria, August 17; still sick September 30.

No. 236. Company I: Malaria, August 17; furloughed from division hospital August 29. In hospital this case was diagnosed typhoid fever.

No. 237. Company H: Sent to division hospital August 17 without diagnosis. Here the disease was diagnosed remittent malaria, and the patient was furloughed September 9.

No. 238. Company M: Malaria, August 17; still sick September 30.

No. 239. Company H: Malaria, August 17; still sick September 30.

No. 240. Company E: Malaria, August 17; furloughed from division hospital October 7. In hospital this case was diagnosed typhoid fever.

No. 241. Company I: Malaria, August 17; still sick September 30.

No. 242. Company L: Malaria, August 17; furloughed from division hospital October 3. In hospital this case was diagnosed typhoid fever.

No. 243. Company M: Malaria, August 17; furloughed from division hospital September 9. In hospital this case was diagnosed typhoid fever.

No. 244. Company M: Malaria, August 17; still sick September 30.

No. 245. Company A: Malaria, August 17; still sick September 30.

No. 246. Company G: Malaria, August 18; still sick September 30.

No. 247. Company A: Malaria, August 18; still sick September 30.

No. 248. Company L: Malaria, August 18; still sick September 30.

No. 249. Company F: Malaria, August 18; still sick September 30.

No. 250. Company H: Malaria, August 18; still sick September 30.

No. 251. Company F: Malaria, August 18; furloughed from division hospital August 30. In hospital this case was diagnosed typhoid fever.

No. 252. Company I: Malaria, August 18; still sick September 30.

No. 253. Company B: Malaria, August 18; still sick September 30.

No. 254. Company G: Malaria, August 18; furloughed from division hospital September 23. In hospital this case was diagnosed typhoid fever.

No. 255. Company L: Malaria, August 18; still sick September 30.

No. 256. Company A: Malaria, August 18; still sick September 30.

No. 257. Company L: Malaria, August 18; furloughed from division hospital September 8. In hospital this case was diagnosed typhoid fever.

No. 258. Company B: Malaria, August 18; still sick September 30.

No. 259. Company M: Malaria, August 18; still sick September 30.

No. 260. Company F: Sent to division hospital August 18 without diagnosis. Here the disease was diagnosed typhoid fever, and the patient was furloughed August 29.

No. 261. Company A: Malaria, August 18; still sick September 30.

No. 262. Company D: Malaria, August 18; furloughed from division hospital September 8. In hospital this case was diagnosed typhoid fever.

No. 263. Company A: Malaria, August 18; furloughed from division hospital August 31. In hospital this case was diagnosed typhoid fever.

No. 264. Company L: Malaria, August 18; still sick September 30.

No. 265. Company A: Malaria, August 18; furloughed from division hospital August 30. In hospital this case was diagnosed typhoid fever.

No. 266. Company F: Sent to Leiter Hospital August 18 without diagnosis. Here the disease was diagnosed remittent malaria, and the patient was furloughed August 29.

No. 267. Company L: Malaria, August 19; still sick September 30.

No. 268. Company I: Sent to division hospital August 19 without diagnosis. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 8.

No. 269. Company A: Malaria, August 19; still sick September 30.

No. 270. Company K: Sent to division hospital August 19 without diagnosis. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 5.

No. 271. Company A: Malaria, August 19; still sick September 30.

No. 272. Company D: Sent to Sternberg Hospital August 19 without diagnosis. Here the disease was diagnosed typhoid fever, and the patient was furloughed August 24.

No. 273. Company E: Malaria, August 19; furloughed from division hospital September 8. In hospital this case was diagnosed typhoid fever.

No. 274. Company I: Sent to Sternberg Hospital August 19 without diagnosis. Here the disease was diagnosed typhoid fever, and the patient was furloughed August 24.

No. 275. Company E: Sent to Sternberg Hospital August 19 without diagnosis. Here the disease was diagnosed typhoid fever, and the patient was furloughed August 26.

No. 276. Company C: Malaria, August 19; still sick September 30.

No. 277. Company M: Sent to Sternberg Hospital August 19 without diagnosis. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 8.

No. 278. Company B: Malaria, August 20; still sick September 30.

No. 279. Company M: Malaria, August 20; still sick September 30.

No. 280. Company G: Malaria, August 20; still sick September 30.

No. 281. Company K: Malaria, August 20; still sick September 30.

No. 282. Company H: Malaria, August 20; still sick September 30.

No. 283. Company L: Malaria, August 20; still sick September 30.
 No. 284. Company C: Sent to division hospital without diagnosis August 20. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 8.

No. 285. Company I: Sent to division hospital without diagnosis August 20. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 8.

No. 286. Company K: Sent to Leiter Hospital without diagnosis August 20. Here the disease was diagnosed remittent malaria, and the patient was furloughed September 8.

No. 287. Company D: Sent to division hospital without diagnosis August 20. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 8.

No. 288. Company L: Sent to division hospital August 20 without diagnosis. Here the disease was diagnosed typhoid fever, and the patient was transferred to Sternberg Hospital September 9.

No. 289. Company M: Malaria, August 20; still sick September 30.

No. 290. Company B: Malaria, August 20; still sick September 30.

No. 291. Company G: Malaria, August 20; still sick September 30.

No. 292. Company G: Sent to division hospital without diagnosis August 20. Here the disease was diagnosed typhoid fever and the patient was furloughed September 20.

No. 293. Company H: Malaria, August 20; still sick September 30.

No. 294. Company F: Malaria, August 21; still sick September 30.

No. 295. Company M: Malaria, August 21; furloughed from division hospital September 23. In hospital this case was diagnosed typhoid fever.

No. 296. Company A: Sent to division hospital without diagnosis August 21. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 8.

No. 297. Company L: Sent to division hospital without diagnosis August 21. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 8.

No. 298. Company G: Malaria, August 21; furloughed from division hospital September 8. In hospital this case was diagnosed typhoid fever.

No. 299. Company C: Malaria, August 21; still sick September 30.

No. 300. Company M: Sent to division hospital without diagnosis August 21. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 8.

No. 301. Company G: Malaria, August 21; furloughed from division hospital September 15. In hospital this case was diagnosed typhoid fever.

No. 302. Company C: Sent to division hospital without diagnosis August 21. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 15. The initial date of this man's illness is probably July 3, because on this date he was sent to Leiter Hospital. Here the disease was diagnosed remittent malaria, and he was discharged August 18. The record shows that three days later he went to division hospital with typhoid fever. He probably had typhoid fever in Leiter Hospital and had a relapse when he was sent to division hospital.

No. 303. Company K: Malaria, August 21; furloughed from division hospital September 20. In hospital this case was diagnosed typhoid fever.

No. 304. Company D: Sent to division hospital August 21 without diagnosis. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 8.

No. 305. Company D: Malaria, August 21; still sick September 30.

No. 306. Company I: Sent to division hospital August 21 without diagnosis. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 8.

No. 307. Company G: Malaria, August 21; furloughed from division hospital September 8. In hospital this case was diagnosed typhoid fever.

No. 308. Company F: Sent to division hospital without diagnosis August 21. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 8.

No. 309. Company H: Malaria, August 21; still sick September 30.

No. 310. Company D: Malaria, August 21; still sick September 30.

No. 311. Company D: Malaria, August 23; still sick September 30.

No. 312. Company F: Malaria, August 23; still sick September 30.

 No. 426. Company K: Fever, October 13; still sick in hospital at New Ulm November 5.
 No. 427. Company H: Fever, October 28; sick in hospital at New Ulm November 5.
 No. 428. Company C: Fever, October 30; sick in hospital at New Ulm November 5.
 No. 429. Company M: Fever, October 30; sick in hospital at New Ulm November 5.
 No. 430. Company L: Fever, October 31; sick in hospital at New Ulm November 5.
 No. 431. Company B: Fever, October 31; sick in hospital at New Ulm November 5.
 No. 432. Company B: Typhoid fever, November 2; mustered out December 21.
 No. 433. Company I: Typhoid fever November 2; discharged December 21.

The last two cases were from Fort Thomas, and were probably sent to this place before the regiment left Lexington, Ky. It will be seen that there is a break in the cases of supposed typhoid fever from July 20 to August 2. This is due to the fact that the cases left incomplete in July were not carried to the August report. How many of these were typhoid fever we can not tell. There were in all 101 incomplete cases left in the July report and not connected with any subsequent report. It will be erroneous to suppose from the record that typhoid fever ceased to appear July 20 and that there was but one case between that time and August 2. As stated earlier in our history of this regiment, the records were so poorly kept that many cases of probable typhoid fever have undoubtedly escaped our efforts to detect them.

SUMMARY.

Assembled at Camp Ramsey, St. Paul, Minn., April 29, 1898.
 Mustered into United States service May 6 and 7, 1898.
 Arrived at Chickamauga Park May 20, 1898.
 Strength on arrival, 1,032.
 Date of first case of probable typhoid fever May 20, 1898.
 Date of first case of recognized typhoid fever June 1, 1898.

Left Chickamauga Park August 23, 1898.	
Strength on departure, 1,299.	
Number of cases of probable typhoid fever developed at Chickamauga	320
Arrived at Lexington, Ky., August 25, 1898.	
Left Lexington, Ky., September 15, 1898.	
Number of cases of probable typhoid fever developed at Lexington, Ky.	96
Arrived at New Ulm, Minn., September 17, 1898.	
Number of cases of probable typhoid fever developed at New Ulm up to October 31, 1898	17
Total number of cases of probable typhoid fever developed in the Twelfth Minnesota Volunteer Infantry from May to October, inclusive	433
These 433 cases were diagnosed as follows:	
Typhoid fever	144
Malaria	202
Indigestion	49
Undetermined fever	31
Diarrhea	4
Colitis	1
Catarrhal jaundice	1
Gastritis	1
Total	433

The following is an alphabetical list of the total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
1898.				
Beaudelt, Albert A ..	Pvt., M.	July 11	Fort Thomas, Ky.	Typhoid.
Bejeck, Fred	Band ..	Aug. 11	Camp Thomas, Ga.	Do.
Bell, Oliver	Corpl. D	Sept. 9	Do.	Do.
Bennett, Elsha O.	Sgt., M.	Sept. 30	New Ulm, Minn.	Do.
Bundrick, Carl	Pvt., B.	Aug. 13	Camp Thomas, Ga.	Enteric fever.
Brown, C. Leon	Pvt., D.	Aug. 20	do	Disease not stated.
Chapen, Harvey A.	Sgt., G.	Aug. 23	do	Typhoid.
Dickelnick, Wm. F.	Pvt., B.	Sept. 9	Dundas, Minn.	Do.
Hurd, Wallace A.	Pvt., M.	June 23	Camp Thomas, Ga.	Do.
Jakusz, Joseph	Pvt., E.	July 19	Fort Thomas, Ky.	Purpura hemorrhagica.
McDermott, Fred, E.	Pvt., F.	Sept. 13	St. Paul, Minn.	Typhoid.
Mikkelson, Mikel	Pvt., G.	Aug. 19	Camp Thomas, Ga.	Typhoid and acute pneumonia.
Mueller, Louis	1st Lt., F.	Sept. 1	New Ulm, Minn.	Typhoid.
Myers, Harry	Pvt., M.	Aug. 13	No place given	Typhoid and pneumonia.
Kaiser, Joseph	Pvt., E.	Sept. 15	City and County Hospital at St. Paul, Minn.	Typhoid.
Kennedy, Thomas J.	Pvt., B.	Sept. 10	Camp Hamilton, Ky.	Do.
Paulsen, Christian	Pvt., G.	Aug. 30	do	Do.
Roell, C. E.	Sgt., B.	Sept. 19	do	Do.
Sandburg, Norman	Pvt., F.	Sept. 16	St. Paul, Minn.	Do.

The only two deaths in this list not attributed to typhoid fever in the official records at Washington are Brown and Jakusz. The regimental and the hospital records show that both of these men had typhoid fever. Consequently all the deaths in this regiment were due to this disease. Calculated on a total of 433 probable cases, 19 deaths give a death rate of a little more than 4.38 per cent. Calculated on the recognized cases, 144 in number, this would give a death rate of 13.19 per cent. In our opinion these figures show that our total of probable cases more nearly represents the actual number of cases of typhoid fever than is represented by the number of recognized cases.

COMMUNICATIONS FROM THE SURGEONS OF THE TWELFTH MINNESOTA VOLUNTEER INFANTRY.

Medical officers.

Thomas C. Clark, major and surgeon, Stillwater, Minn.
William H. Caine, captain and assistant surgeon, Minneapolis, Minn.
William H. Rowe, lieutenant and assistant surgeon, St. James, Minn.

Captain Caine states:

The location of our camp at Chickamauga was poor. The south end of the ground occupied by us as a camp site was 20 feet higher than the remaining portion, causing in time of rain storms a flooding of two-thirds of the camp with the filth coming from the higher ground. The soil did not exceed 2 inches in depth and was mostly clay, with underlying rock. Sinks could not be properly constructed, and they were not carefully policed. The refuse from the kitchens was dumped into the company sinks. I have seen large pieces of decomposing meat and vegetables, old shoes, and portions of clothing in mess sinks, with but a sprinkling of earth on top. The water supply was insufficient to give the men enough for drinking purposes and for cleanliness of person. The water had to be hauled in barrels 8 miles, and this was of a poor quality, forming a sediment on standing. There was but little of the water used before boiling. The heat was intolerable from the day we arrived until our departure, the daily average temperature from 5 a. m. to 8 p. m. in hospital tent being about 100° F. After 8 p. m. there was a heavy dew, causing tents and bedclothing to become very damp, mold to form on shoes and rust on guns and side arms, if at all exposed to this dampness. Rain fell daily for a period of five weeks in showers, filling up depressions in the ground, and afterwards green fungi formed on the surface of the water and on the earth upon which the water had stood. Men who bathed in Chickamauga Creek almost invariably became sick in consequence thereof. The cooks were careless in having too much grease in all kinds of meat, beans, and mush. The bacon issued was frequently bad. Maggots held high carnival in the sinks. Camps were in too close proximity to each other. The atmosphere was laden with the odor emanating from insanitary sinks and unclean men. The regimental hospitals were dirty, and the division hospitals were in a most insanitary condition.

The location of our camp at Lexington, Ky., was superb, and the water supply was beyond question. No sickness occurred there except among men infected at Chickamauga. The same is true of our camp at New Ulm, Minn.

Captain Rowe states:

The camp of the Twelfth Minnesota Volunteer Infantry at Chickamauga was situated on sloping ground in the woods, and about one-half a mile from Chickamauga Creek, near the site of the old Alexander House. Our water supply was at first from a spring near the Alexander Bridge, 1 mile from camp. Afterwards we obtained water from Blue Rock Spring, about 4 miles distant, and finally from a tubular well sunk in the vicinity of camp. On account of the rocky nature of the soil sinks could not be properly constructed. Moreover, the clay thrown from the sinks in digging did not absorb the fluid contents when returned to the pit, and we had no material to use in filling the sinks. It was absolutely impossible to keep the sinks in a sanitary condition without the use of disinfectants, and these we were unable to obtain until the summer was well-nigh gone and our men badly infected with typhoid fever. Although we made requisition after requisition for disinfectants soon after going into camp we obtained only 3 or 4 barrels of lime during the entire summer. We were told that it was a reflection upon the policing of the camp if disinfectants were needed. In my opinion the Medical Department at Washington did not understand the conditions as they existed in Chickamauga Park. Had they known that open sinks, dug in impervious soil and rock, were used they would certainly have known that dis-

infectants must be used to prevent the spread of infectious diseases. Our sick roll was very large during the summer. Most of the cases were acute indigestion and diarrhea. Remittent malarial fever came next, and we had quite a number of cases of typhoid fever, although we were not as badly afflicted with the last-mentioned disease as some neighboring regiments. I believe that the first cases of typhoid fever were from infected drinking water. Perhaps the infection did not come from the spring water, but the men would drink water from any source. The cases of malaria arose from bathing in Chickamauga Creek, and had we had a plentiful supply of pure water in camp for bathing, our men would have escaped this disease to a great extent. The cases of indigestion and diarrhea were largely due to indiscretions in diet.

Major Clark writes:

The regiment arrived at Chickamauga after dark on the evening of May 19, 1898, and the only water obtainable that night was from Chickamauga Creek. The next day, and for a few days after, water was obtained from a small spring in the vicinity of Alexander Bridge. Later, the chief water supply for the regiments in the vicinity of the Twelfth Minnesota was obtained from Blue Springs, about $2\frac{1}{2}$ miles from Alexander Bridge, from driven wells, and from Park Spring, about 6 miles northwest of Camp Thomas. The question of the water supply of Camp Thomas has been pretty freely discussed and opinions differ. My personal opinion is that the water of Chickamauga Creek was contaminated, and I do not see how it could be otherwise, as it drained an area on which there were hundreds of typhoid-fever cases, the surface drainage of which went into that stream. The principal causes of infection, however, were the flies and the dust. The flies had free access to the uncovered sinks, and the dust permeated everything. The water supply at the fair grounds (Camp Ramsey) was from the city waterworks of St. Paul. I do not think that any cases originated there, as neither the Thirteenth nor Fourteenth Minnesota developed any cases within a period that would indicate it.

The camp of the Twelfth Minnesota at Lexington was located about 6 miles from the city in a large field. The sinks were dug deep and covered over. The water supply was from a large living spring and the sanitary conditions were of the best.

I know nothing of the camp at New Ulm, Minn. A case of typhoid developed in the Fifth Pennsylvania within a few days after their arrival at Camp Thomas, but that regiment did not have a large number of typhoid cases until July.

I do not think that cases Nos. 1 and 2 were typhoid. The change of climate, hot weather, and heavy food caused a good deal of intestinal trouble the first two weeks we were there. I had an attack of diarrhea and intestinal indigestion, which lasted fully as long as cases Nos. 1 and 2, but from which I fully recovered. I think No. 3 is the first case of typhoid developed in the regiment.

The reason for the number of cases of undetermined fever sent to the hospitals is that after June 15 all cases appearing at sick call with a temperature of 100 or over were sent immediately to the hospital before an exact diagnosis could be made, and later on, when the division hospital became crowded, many cases were sent direct to Sternberg and Leiter hospitals from the regiments.

When the fever cases first appeared in the hospital, there were some differences of opinion among the staff as to the character of it, some holding that it was more of a malarial character than typhoid. About the 1st of July Maj. J. D. Griffith, chief surgeon of division; Maj. W. S. Stewart, Ninth Pennsylvania, and myself, made a diagnosis of 75 cases, 25 of which we all agreed were typhoid, 25 we all agreed were suspected typhoid, and the other 25 we could not agree upon. I checked these latter cases up as they developed and about 80 per cent of them proved to be typhoid. These notes were left behind when I came home sick, and I could never get track of them. The clinical histories of the cases in the Third Division Hospital at Camp Thomas, together with the clinical charts, were boxed up and sent to Washington, after my return home.

According to my recollection there were about 1,300 cases treated in the Third Division Hospital, Camp Thomas, between June 10 and August 30, during my connection with it. I should estimate that about 900 of them were diagnosed as typhoid. I think that there were 62 deaths during that period, about 55 of them from typhoid fever.

My recollection is that about 225 or 250 cases were sent to the hospital from the Twelfth Minnesota during that period, possibly more.

There were undoubtedly many mild cases treated in the regiment which never appeared at the division hospital. There were two types of the disease prevalent, one very mild in character without any marked symptoms, the patient often remaining on duty until the second week of the disease. The most virulent cases came from the Second Battalion of the Ninth Pennsylvania. This regiment was located on a rocky ridge, and this battalion obtained its water supply from a driven well located at the foot of a small ravine leading down from the ridge. It was supposed that this well became contaminated either from surface drainage or from drainage from the sinks down through the shaly rock.

In connection with the question of malaria, I wish to cite the case of Private Tally, of the First South Carolina. He had a very severe attack of typhoid fever, with profuse hemorrhages and a persistent high temperature, with intermissions. However, I saw him in consultation with Doctor Lawson, of the First South Carolina, on my staff, in whose ward he was, and recommended that he give him large doses of quinine, which he did, with a very satisfactory lowering of temperature. As his typhoid symptoms subsided the malarial became more pronounced. His convalescence was tedious and was complicated by a relapse, brought on by his anxiety to go home on a furlough. I can not but feel that this was a case of typho-malarial infection. Most of the cases were characterized by an intermittent fever, which is well shown on the two or three hundred clinical charts, which I suppose are in Washington.

I regret that I had neither the time nor the opportunity to make blood examinations, owing to the lack of sufficient help. Many cases came to the hospital in an advanced stage of typhoid and had reported on sick call only a day or two before. One case from the Eighth Massachusetts, admitted at 3 p. m. with a diagnosis of intestinal indigestion, died that evening at 7. A post-mortem revealed it to be an advanced case of typhoid, and death was undoubtedly caused by exhaustion, due to remaining on duty in that condition, as he had first reported to the regimental surgeon the day before. A case from the Twelfth Minnesota died forty-eight hours after admission, and had only been on sick report two days before admission. This man had enormous ulcerated patches in the bowel.

My own case of typhoid was contracted from infected dust, which I think was nearly as important a factor as the flies in carrying infection.

I would like to state that we were convinced in the hospital of the prevalence of typhoid long before it could be impressed upon headquarters, where there seemed to be a tendency to discredit the number of cases reported.

I think that your estimate of the number of cases of probable typhoid in the Twelfth Minnesota is somewhat high. In my judgment I would make the following estimate:

Typhoid fever.....	144
Malaria.....	180
Indigestion.....	25
Undetermined fever.....	31
Total.....	380

This would make the per cent of deaths, counting them all typhoid, 5.

This coincides with an estimate I made in the hospital of cases treated there, but of course I did not include those who died after being sent to other hospitals, and of which I had no knowl-

edge. I now think that the percentage of deaths from typhoid among those treated in or passing through the Third Division Hospital was about 6 per cent. This was a low mortality for the conditions under which the men were received and treated. Excessive drill in the extremely hot weather of May, June, and July, sleeping on the damp ground in the woods, indiscretions in eating and drinking, especially of ice-cold beer immediately after coming in from drill, the depression incident to the failure to get into active service, following the close of the war in July, and the consequent nostalgia, were predisposing causes enervating the men and rendering them susceptible to infection. The overcrowded conditions of the hospitals, insufficient and inefficient nurses in the division hospitals at Chickamauga, the inability to use the cold baths as fully as needed, the necessity of moving patients in the critical stage of the disease, all contributed somewhat to the mortality which, after all, I think was low, taking into consideration all the circumstances.

With the possible exception of the water from Chickamauga Creek and the well before mentioned, I think that the water had little to do with the origin or spread of the disease. The typhoid excreta on the grounds impregnating the dust, the open sinks through the medium of the flies did the business.

FIRST SOUTH CAROLINA VOLUNTEER INFANTRY.

We desire to state in this place only a few facts in regard to this regiment. It arrived at Chickamauga June 7, 1898, and departed for Jacksonville, Fla., July 29, 1898. A discussion of typhoid fever in this regiment will be found in the list of regiments of the Seventh Army Corps. We only wish to state here that this regiment reached Chickamauga infected with typhoid fever, as it had during its stay at this place 15 cases of recognized typhoid fever, 2 deaths from recognized typhoid fever, and 7 deaths in all. For further particulars concerning this regiment the reader is referred to the Seventh Army Corps.

EIGHTH MASSACHUSETTS VOLUNTEER INFANTRY.

Second Brigade, Third Division, First Army Corps.

This regiment assembled May 5 at South Framingham, Mass. It remained at this place until May 16, when it departed for Chickamauga Park, Ga., arriving on the evening of May 19. May 20 it went into permanent camp at Chickamauga. Major Cogswell makes the following statement:

The prevailing disease has been gastro-enteritis, due to lack of fresh meats, insufficiency of drinking water, and change from a cool climate to a hot one. The water apparently contains laxative substances; excessive drill is also believed to influence the health. All drinking water is being boiled. From my personal notes in 200 cases of gastro-enteritis blood is claimed to have been present in the stools. One hundred cases of this disease had a temperature of 104° F. or more, falling to normal within forty-eight hours when given boiled milk, boiled water, fresh beef juice, salts, and stimulants.

CONDENSED SICK REPORT FOR MAY.

Mean strength.....	932
Diarrhea.....	7
Dysentery.....	11
Gastro-enteritis.....	21
Other diseases.....	48
Total.....	87

The first entry on this record is made May 11. One case of gastro-enteritis died. This was a private in Company C, who was taken sick May 28 and died at 9.20 p. m. May 29. There is no record of autopsy.

There are no sick reports for this regiment for June, July, and August. This is to be especially regretted, because this is the one regiment whose medical officers claim to have used exclusively boiled water all the time it was at Chickamauga.

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength, not given.....	
Gastro-enteritis.....	516
Diarrhea.....	52
Remittent malaria.....	86
Intermittent malaria.....	1
Typhoid fever.....	27
Other diseases.....	26
Total.....	708

In the absence of regimental sick reports we have been compelled to rely exclusively upon hospital records for information concerning the sick in this regiment. The following is a list of recognized and suspected typhoid cases in this regiment, as shown by hospital records:

No. 1. Company C: Gastro-enteritis, May 28; died May 29. This is the case already referred to, and, of course, we can not say that it was a case of typhoid fever; but this is a possibility.

No. 2. Company C: Sent to Leiter Hospital with typhoid fever July 24; furloughed September 11.

No. 3. Company C: Sent to division hospital July 24 with typhoid fever; furloughed August 26.

No. 4. Company M: Sent to division hospital August 4 with typhoid fever; furloughed September 14.

No. 5. Band: Sent to division hospital August 6, with typhoid fever; furloughed August 22.

No. 6. Company C: Sent to division hospital August 7 with typhoid fever; further disposition not given.

No. 7. Company M: Sent to division hospital August 7 with typhoid fever; furloughed September 13.

No. 8. Company K: Sent to division hospital August 8 with typhoid fever; furloughed August 31.

No. 9. Company G: Sent to division hospital August 8 with typhoid fever; furloughed August 29.

No. 10. Company E: Sent to division hospital August 8 with typhoid fever; furloughed September 13.

No. 11. Company E: Sent to division hospital August 12 with typhoid fever; furloughed September 13.

No. 12. Company B: Sent to division hospital August 12 with typhoid fever; furloughed August 30.

No. 13. Company C: Sent to division hospital August 12 with typhoid fever; furloughed September 13.

No. 14. Company F: Sent to division hospital August 12 with typhoid fever; furloughed September 3.

No. 15. Company F: Sent to division hospital August 13 with typhoid fever; furloughed September 13.

No. 16. Company E: Sent to division hospital August 16 with typhoid fever; furloughed August 31.

No. 17. Company H: Sent to Sternberg Hospital August 16 with typhoid fever; furloughed September 13.

No. 18. Company L: Sent to division hospital August 16 with typhoid fever; furloughed September 18.

No. 19. Company I: Sent to Sternberg Hospital August 16 with typhoid fever; furloughed August 22.

- No. 20. Company H: Sent to Sternberg Hospital August 16 with typhoid fever; furloughed August 27.
- No. 21. Company E: Sent to Sternberg Hospital August 16 with typhoid fever; furloughed August 25.
- No. 22. Company E: Sent to Sternberg Hospital August 16 with typhoid fever; furloughed October 26.
- No. 23. Company H: Sent to Sternberg Hospital August 16 with typhoid fever; furloughed September 13.
- No. 24. Company D: Sent to Sternberg Hospital August 16 with remittent malaria; furloughed September 26.
- No. 25. Company H: Sent to division hospital August 17 with typhoid fever; furloughed August 29.
- No. 26. Company F: Sent to Sternberg Hospital August 17 with typhoid fever; furloughed August 24.
- No. 27. Company F: Sent to division hospital August 17 with typhoid fever; furloughed September 20.
- No. 28. Company H: Sent to Sternberg Hospital August 18 with typhoid fever; furloughed September 3.
- No. 29. Company C: Sent to division hospital August 18 with typhoid fever; furloughed September 13.
- No. 30. Company F: Sent to Sternberg Hospital August 19 with typhoid fever; furloughed September 8.
- No. 31. Company K: Sent to Sternberg Hospital August 19 with malaria; furloughed August 27.
- No. 32. Company K: Sent to Sternberg Hospital August 19 with typhoid fever; furloughed August 27.
- No. 33. Civilian: Sent to Sternberg Hospital August 19 with typhoid fever; furloughed September 17.
- No. 34. Company I: Sent to Sternberg Hospital August 19 with typhoid fever; furloughed September 9.
- No. 35. Company I: Sent to Sternberg Hospital August 19 with typhoid fever; furloughed September 8.
- No. 36. Company M: Sent to Sternberg Hospital August 19 with typhoid fever; furloughed August 24.
- No. 37. Company L: Sent to Sternberg Hospital August 19 with typhoid fever; furloughed September 5.
- No. 38. Company F: Sent to Sternberg Hospital August 19 with typhoid fever; furloughed September 7.
- No. 39. Company K: Sent to Sternberg Hospital August 19 with typhoid fever; furloughed September 8.
- No. 40. Company I: Sent to Sternberg Hospital August 19 with typhoid fever; furloughed September 9.
- No. 41. Company I: Sent to division hospital August 20 with typhoid fever; furloughed September 20.
- No. 42. Company M: Sent to division hospital August 20 with typhoid fever; furloughed September 13.
- No. 43. Company I: Sent to division hospital August 20 with typhoid fever; furloughed September 20.
- No. 44. Company M: Sent to division hospital August 20 with typhoid fever; furloughed September 14.
- No. 45. Company C: Sent to division hospital August 20 with typhoid fever; furloughed September 13.
- No. 46. Company B: Sent to division hospital August 20 with typhoid fever; furloughed September 3.
- No. 47. Company A: Sent to division hospital August 20 with typhoid fever; furloughed September 18.
- No. 48. Company M: Sent to division hospital August 20 with typhoid fever; furloughed October 5.
- No. 49. Company A: Sent to division hospital August 23 with typhoid fever; died September 4.
- No. 50. Company H: Sent to division hospital August 23 with typhoid fever; further disposition not given.
- No. 51. Company B: Sent to division hospital August 23 with typhoid fever; died September 3.
- No. 52. Company D: Sent to division hospital August 23 with typhoid fever; furloughed September 13.
- No. 53. Company B: Sent to division hospital August 23 with typhoid fever; furloughed September 13.
- No. 54. Company I: Sent to division hospital August 23 with typhoid fever; furloughed September 15.
- No. 55. Company I: Sent to division hospital August 23 with typhoid fever; furloughed September 13.
- No. 56. Company B: Sent to division hospital August 25 with typhoid fever; furloughed September 14.
- No. 57. Company M: Sent to division hospital August 26 with remittent malaria; furloughed September 14.
- No. 58. Company M: Sent to division hospital August 26 with intermittent malaria; furloughed September 19.
- No. 59. Company G: Sent to division hospital August 26 with remittent malaria; furloughed September 25.
- No. 60. Company I: Sent to division hospital August 26 with typhoid fever; furloughed October 14.
- No. 61. Company F: Sent to division hospital August 26 with remittent malaria; furloughed September 19.
- No. 62. Company E: Sent to division hospital August 26 with typhoid fever; furloughed October 6.
- No. 63. Company E: Sent to division hospital August 28 with typhoid fever; furloughed October 3.
- No. 64. Company M: Sent to division hospital August 28 with remittent malaria; furloughed September 23.
- No. 65. Company C: Sent to division hospital August 28 with typhoid fever; furloughed October 22.
- No. 66. Company K: Sent to division hospital August 28 with remittent malaria; furloughed September 14.
- No. 67. Company M: Sent to division hospital August 29 with remittent malaria; furloughed September 23.
- No. 68. Company A: Sent to division hospital August 29 with intermittent malaria; furloughed September 17.
- No. 69. Company I: Sent to division hospital August 29 with remittent malaria; furloughed September 10.
- No. 70. Company K: Sent to division hospital August 29 with typhoid fever; furloughed October 12.
- No. 71. Company G: Sent to division hospital August 29 with remittent malaria; furloughed October 14.

No. 218. Company I: Sent to division hospital October 5 with typhoid fever; furloughed November 1.

No. 219. Company E: Sent to division hospital October 5 with typhoid fever; transferred to Fort Thomas November 5.

No. 220. Company A: Sent to division hospital October 6 with remittent malaria; returned to quarters October 26.

No. 221. Company G: Sent to division hospital October 6 with typhoid fever; furloughed from Fort Thomas November 15.

No. 222. Company A: Sent to division hospital October 6 with remittent malaria; transferred to Fort Thomas November 2.

No. 223. Company K: Sent to division hospital October 6 with typhoid fever; further disposition not given.

No. 224. Company C: Sent to division hospital October 6 with typhoid fever; further disposition not given.

No. 225. Company F: Sent to division hospital October 6 with remittent malaria; returned to quarters October 24.

No. 226. Company K: Sent to division hospital October 6 with catarrhal jaundice; furloughed October 21.

No. 227. Company M: Sent to division hospital October 7 with remittent malaria; transferred to Fort Thomas November 2.

No. 228. Company F: Sent to division hospital October 8 with remittent malaria; furloughed November 1.

No. 229. Company I: Sent to division hospital October 8 with catarrhal jaundice; furloughed October 19.

No. 230. Company D: Sent to division hospital October 9 with typhoid fever; furloughed October 29.

No. 231. Company L: Sent to division hospital October 9 with typhoid fever; furloughed October 25.

No. 232. Company F: Sent to division hospital October 10 with typhoid fever; discharged from Fort Thomas December 14.

No. 233. Company E: Sent to division hospital October 11 with catarrhal jaundice; furloughed November 2.

No. 234. Company K: Sent to division hospital October 11 with remittent malaria; furloughed November 2.

No. 235. Company D: Sent to division hospital October 11 with remittent malaria; furloughed November 2.

No. 236. Company D: Sent to division hospital October 11 with gastritis; furloughed October 28.

No. 237. Company E: Sent to division hospital October 13 with intermittent malaria; furloughed October 28.

No. 238. Company E: Sent to division hospital October 14 with typhoid fever; discharged December 15.

No. 239. Company C: Sent to division hospital October 14 with catarrhal jaundice; furloughed October 29.

No. 240. Company K: Sent to division hospital October 17 with typhoid fever; transferred to Fort Thomas November 5.

No. 241. Company H: Sent to division hospital October 19 with remittent malaria; transferred to Fort Thomas November 2.

No. 242. Company I: Sent to division hospital October 20 with remittent malaria; transferred to Fort Thomas November 2.

No. 243. Company D: Sent to division hospital October 20 with catarrhal jaundice; furloughed November 1.

No. 244. Company B: Sent to general hospital October 23 with typhoid fever; furloughed November 23.

No. 245. Company C: Sent to division hospital October 23 with remittent malaria; furloughed November 8.

No. 246. Company C: Sent to division hospital October 23 with typhoid fever; further disposition not given.

No. 247. Company B: Sent to division hospital October 24 with typhoid fever; furloughed from Fort Thomas November 17.

No. 248. Company C: Sent to division hospital October 24 with remittent malaria; transferred to Fort Thomas November 5.

No. 249. Company D: Sent to division hospital October 24 with typhoid fever; transferred to Fort Thomas November 5.

No. 250. Company H: Sent to division hospital October 24 with gastritis; transferred to Fort Thomas November 5.

No. 251. Company K: Sent to division hospital November 2 with typhoid fever; furloughed November 4.

No. 252. Company F: Sent to division hospital November 2 with remittent malaria; furloughed November 4.

No. 253. Company L: Sent to Fort Thomas November 2 with malaria; furloughed November 28.

No. 254. Company H: Sent to Fort Thomas November 2 with malaria; returned to duty December 13.

No. 255. Company I: Sent to Fort Thomas November 2 with typhoid fever; discharged December 3.

No. 256. Company E: Sent to Fort Thomas November 2 with typhoid fever; furloughed November 16.

No. 257. Company G: Sent to Fort Thomas November 2 with typhoid fever; furloughed November 4.

No. 258. Company F: Sent to Fort Thomas November 2 with typhoid fever; further disposition not given.

No. 259. Company A: Sent to Fort Thomas November 2 with typhoid fever; died December 1.

No. 260. Company M: Sent to Fort Thomas November 2 with typhoid fever; discharged December 15.

No. 261. Company M: Sent to Fort Thomas November 2 with typhoid fever; discharged December 20.

No. 262. Company K: Sent to division hospital November 3 with typhoid fever; transferred to Fort Thomas November 5.

No. 263. Company A: Sent to Fort Thomas November 5 with typhoid fever; further disposition not given.

No. 264. Company D: Sent to Fort Thomas November 5 with typhoid fever; furloughed November 22.

No. 265. Company K: Sent to Fort Thomas November 5 with typhoid fever; further disposition not given.

No. 266. Company E: Sent to Fort Thomas November 5 with typhoid fever; discharged December 27.

No. 267. Company D: Sent to Fort Thomas November 5 with typhoid fever; furloughed November 11.

No. 268. Company M: Sent to Fort Thomas November 5 with typhoid fever; furloughed November 15.

No. 269. Company L: Sent to Fort Thomas November 5 with typhoid fever; further disposition not given.

No. 270. Company A: Sent to Fort Thomas November 16 with remittent malaria; furloughed December 1.

No. 271. Company K: Sent to Fort Thomas November 16 with typhoid fever; discharged December 16.

No. 272. Company G: Sent to Fort Thomas November 16 with typhoid fever; discharged December 22.

SUMMARY.

Assembled at South Framingham, Mass., May 5, 1898.
 Mustered into United States service May 8, 1898.
 Arrived at Chickamauga Park, Ga., May 20, 1898.
 Strength on arrival, 932.
 Date of first case of probable typhoid fever, May 28, 1898.
 Date of first case of recognized typhoid fever, July 24, 1898.
 Left Chickamauga Park, August 23, 1898.
 Strength on departure, 1,317.
 Number of cases of probable typhoid fever developed at Chickamauga 55
 Arrived at Lexington, Ky., August 25, 1898.
 Number of cases of probable typhoid fever developed after leaving Chickamauga:
 From August 25 to 31 22
 During September 123
 During October 50
 During November 22
 Total number of cases of probable typhoid fever developed in the Eighth Massachusetts Volunteer Infantry from May to November, 1898 272

These 272 cases were diagnosed as follows:

Typhoid fever.....	157
Malaria.....	94
Catarrhal jaundice.....	16
Gastro-enteritis.....	1
Gastritis.....	3
Diarrhea.....	1
Total.....	272

As has been stated, special interest attaches to this regiment because the claim was made that all the water was boiled and that typhoid fever did not occur until relatively late in the summer. Our list of probable cases of typhoid fever corresponds with this view. The opinion was prevalent among medical officers at Chickamauga that typhoid fever did not appear until very late in this regiment and that this was due to the fact that the drinking water was boiled. As illustrating the opinion held by medical officers on this point, we will make a quotation from a report to the Surgeon-General made by Lieutenant-Colonel Woodhull under date of August 7, 1898. Colonel Woodhull states:

There are general instructions to boil all the water, whether filtered or not. In the only regiment where I could be sure that order was actually enforced—Eighth Massachusetts—no typhoid fever has yet been recognized, and although the camp is very low and wet and remittent fever has occurred within the last fortnight, the general sick rate is only 2.56 per cent.

It can be readily seen that it is of considerable importance to determine whether or not our list of probable cases of typhoid fever is correct. Since preparing that list we have obtained reports from a field hospital to which patients from this regiment were sent during June and July. The following cases bear upon this point:

No. 1. Company D: Gastro-enteritis, May 28 to June 6; diarrhea, June 14 to 24.

No. 2. Company B: Diarrhea, May 31 to June 19.

No. 3. Company D: Gastro-enteritis, June 1 to 10; diarrhea, June 17 to July 4.

No. 4. Company G: Diarrhea, June 1 to 12.

No. 5. Company I: Dysentery, May 29 to June 5; gastro-enteritis, June 7 to 21.

No. 6. Company G: Diarrhea, June 22 to 27; diarrhea, July 1 to 10.

No. 7. Company H: Malaria, July 11; furloughed July 28.

No. 8. Company C: Malaria, July 18; sent to division hospital July 22.

No. 9. Company K: Malaria, July 9 to August 17.

No. 10. Hospital steward: Malaria, July 2; furloughed August 1.

No. 11. Company C: Malarial fever, July 11 to August 3.

No. 12. Company D: Malarial fever, July 20; still absent on leave August 23.

In our opinion these cases were most probably typhoid fever, and should be added to our list of probable cases. If this be right, this regiment was not free from typhoid fever as long as indicated by our list.

The following is an alphabetical list of total deaths in this regiment, so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Balch, John P.....	Sgt., A.	1898. Sept. 4	Camp Thomas, Ga....	Typhoid.
Bartol, Clarence L....	Pvt., C.	May 29	Chickamauga, Ga....	Heart dis- ease.
Benson, Charles W....	Pvt., C.	1899. Mar. 15	Hospital ship <i>Missouri</i>	Malarial fever.
Burnham, Herbert O....	Pvt., D.	1898. May 28	Camp Thomas, Ga....	Pneumonia.
Cahoon, William B....	Pvt., G.	Sept. 30	Camp Hamilton, Ky....	Typhoid.
Constine, Kenneth G....	Pvt., G.	Sept. 3	Camp Thomas, Ga....	Do.
Cook, Geo. O.....	Pvt., D.	Sept. 12	Dorchester, Mass.....	No cause given.
Coombs, Rolom G.....	Pvt., B.	Sept. 18	Camp Hamilton, Ky....	Typhoid.
Curley, William D....	Pvt., G.	Oct. 10do.....	Do.
Deasey, Henry A.....	Pvt., H.	Sept. 13	New Hampshire.....	Do.
Doren, John M.....	Corpl., G.	Aug. 4	Camp Thomas, Ga....	Do.
Dottridge, John F....	Pvt., D.	Sept. 6	Lexington, Ky.....	Do.
Downey, Francis H....	(?), I.	Oct. 24do.....	No cause given.
Draper, Frank E.....	Sgt., M.	Sept. 1	Camp Thomas, Ga....	Typhoid.
Dunn, Harvey A.....	Pvt., L.	July 18do.....	Do.
Florence, Wm. H.....	Pvt., C.	Oct. 8	Camp Hamilton, Ky....	Chronic pa- renchymatous nephritis.
Hanson, John F.....	Pvt., L.	Sept. 22do.....	Typhoid.
Hayes, Michael J.....	Pvt., I.	Sept. 15	Camp Thomas, Ga....	Chronic dysentery.
Higgins, Henry.....	Corpl., B.	Sept. 24	Camp Hamilton, Ky....	Typhoid.
Hinckley, Frank A....	Pvt., I.	Aug. 2	Camp Thomas, Ga....	Do.
Hobbs, S. S.....	Pvt., K.	Aug. 19do.....	No cause given.
Lamprey, Timothy O....	Pvt., B.	June 13do.....	Appendi- citis.
Nicholls, John H.....	Corpl., H.	Sept. 17	Camp Hamilton, Ky....	Typhoid.
Patten, George W.....	Corpl., B.	Sept. 6	Amesbury, Mass.....	No cause given.
Pocket, Joseph.....	Pvt., I.	Aug. 26	Chickamauga, Ga....	Typhoid.
Stewart, Clarence R....	Corpl., M.	June 1	Camp Thomas, Ga....	Pneumonia.
Sweeney, Thomas.....	Pvt., B.	Oct. 20	Camp Hamilton, Ky....	Typhoid.
Thomas, Fred.....	Pvt., F.	Sept. 6	Chickamauga, Ga....	Enteric fever.
Thompson, Walter D....	Pvt., I.	Aug. 7	Camp Thomas, Ga....	Typhoid.
Whalen, George F.....	Pvt., G.	Sept. 19	Camp Hamilton, Ky....	Do.

This gives a total of 30 deaths in this regiment, 19 of which are ascribed to typhoid fever. It will be seen that there are several cases in which the cause of death is not stated, but we will figure on 19 as the actual number of deaths from typhoid fever. Nineteen deaths from 272 probable cases gives a death rate of 6.98 per cent, whereas 19 deaths from 157 recognized cases gives a rate of 12.10 per cent. This is additional reason for believing that our number of probable cases of typhoid fever is not too high.

TWENTY-FIRST KANSAS VOLUNTEER INFANTRY.

Second Brigade, Third Division, First Army Corps.

In the May report Maj. Frank Armstrong states:

Two cases of typhoid fever occurred; both are now convalescent. Care was taken to promptly disinfect the excretions of these patients with chloride of lime. The cause was undoubtedly due to old and insanitary buildings at the State fair grounds at Topeka in which the regiment was quartered.

This regiment reached Chickamauga Park, Ga., May 20, and, as is seen from the above remarks of Major Armstrong, it arrived already infected with typhoid fever.

CONDENSED SICK REPORT FROM MAY 20 TO MAY 31, INCLUSIVE.

Mean strength	1,008
Intermittent malaria	7
Acute diarrhea	42
Dysentery	1
Typhoid fever	2
Other diseases	31
Total	83

The 2 cases of typhoid fever were in Company H, and the initial date for both was May 21.

The June report is signed by F. W. Turner, assistant surgeon in charge, who makes no comment.

CONDENSED SICK REPORT FOR JUNE.

Mean strength	1,320
Intermittent malaria	13
Remittent malaria	15
Acute diarrhea	73
Dysentery	3
Typhoid fever	4
Other diseases	133
Total	241

The recognized cases of typhoid fever include the 2 reported last month and 2 additional. Of the additional ones, 1 belonged to Company K and the other to Company I. There were several other probable cases of typhoid fever in this regiment at this time, as will be seen later.

The July report is without comment.

CONDENSED SICK REPORT FOR JULY.

Mean strength	1,294
Intermittent malaria	45
Remittent malaria	147
Acute diarrhea	140
Dysentery	3
Typhoid fever	15
Other diseases	35
Total	385

The August report also is without comment.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength	1,267
Intermittent malaria	89
Remittent malaria	192
Acute diarrhea	255
Typhoid fever	21
Undetermined fever	1
Other diseases	17
Total	575

This regiment left Chickamauga Park, Ga., August 24, and proceeded to Camp Hamilton, near Lexington, Ky.

The September report also is without comment.

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength	1,254
Intermittent malaria	97
Remittent malaria	159
Acute diarrhea	86
Typhoid fever	6
Other diseases	99
Total	447

Early in September this regiment left Lexington, Ky., and proceeded to Leavenworth, Kans., where the men were furloughed. There is a report for October, but evidently it applies to only a detail. This report consists of 12 cases. Two of these are of interest to us. The surgeon-major was taken with typhoid fever September 26, and was able to return to duty November 9. One of the captains was taken sick October 9 with a disease diagnosed "remittent malaria," and returned to duty October 30.

The following is a list of the recognized and probable cases of typhoid fever in this regiment:

- No. 1. Company H: Typhoid fever, May 21; disposition not given.
- No. 2. Company H: Typhoid fever, May 21 to July 7.
- No. 3. Company K: Typhoid fever, June 1; sent to division hospital without date; further disposition not given.
- No. 4. Company B: Diarrhea, June 2 to 20.
- No. 5. Company I: Biliousness, June 4 to 19.
- No. 6. Company I: Typhoid fever, June 4; died in division hospital July 3.
- No. 7. Company M: Diarrhea, June 6 to 20.
- No. 8. Company M: Diarrhea, June 6 to 27.
- No. 9. Company B: Diarrhea, June 8 to 24.
- No. 10. Company H: Typhoid fever, July 1; disposition not given.
- No. 11. Company A: Remittent malaria, July 1; sent to division hospital July 20; further disposition not given.
- No. 12. Company I: Typhoid fever, July 1; furloughed from Leiter Hospital August 13.
- No. 13. Company D: Remittent fever, July 1; sent to division hospital July 20; further disposition not given.
- No. 14. Company H: Remittent malaria, July 1; still sick in quarters July 31.
- No. 15. Company B: Remittent malaria, July 1; sent to division hospital July 19; further disposition not given.
- No. 16. Remittent malaria, July 1; still sick in division hospital July 31.
- No. 17. Company G: Diarrhea, July 1; deserted July 24.
- No. 18. Company E: Typhoid fever, July 1; sent to Fort Thomas without date.
- No. 19. Company B: Malaria, July 3; still sick July 31.
- No. 20. Company D: Diarrhea, July 4; sent to division hospital July 20; further disposition not given.
- No. 21. Company B: Diarrhea, July 5; still sick in quarters July 31.
- No. 22. Company B: Remittent malaria, July 7; still sick in quarters July 31.
- No. 23. Company D: Intermittent malaria, July 7; still sick in quarters July 31.
- No. 24. Company B: Remittent malaria, July 7; still sick in quarters July 31.

No. 25. Company G: Remittent malaria, July 7; furloughed from Leiter Hospital August 12. In hospital this case was diagnosed typhoid fever.

No. 26. Company E: Diarrhea, July 8; still sick in quarters July 31.

No. 27. Company A: Typhoid fever, July 8; sent to division hospital July 24; further disposition not given.

No. 28. Company C: Remittent malaria, July 10; still sick in quarters July 31.

No. 29. Company A: Typhoid fever, July 11; sent to division hospital July 17 and furloughed August 30.

No. 30. Company B: Typhoid fever, July 11; disposition not given.

No. 31. Company A: Malaria, July 11; sent to division hospital July 31; further disposition not given.

No. 32. Band: Typhoid fever, July 12; furloughed August 20.

No. 33. Company C: Malaria, July 14; still sick August 31.

No. 34. Company A: Typhoid fever, July 14; furloughed from Leiter Hospital August 31.

No. 35. Company B: Diarrhea, July 14; still sick in quarters July 31.

No. 36. Company B: Typhoid fever, July 16; still sick in quarters July 31.

No. 37. Company G: Malaria, July 16; still sick in quarters July 31.

No. 38. Company I: Malaria, July 17; still sick in quarters July 31.

No. 39. Company L: Malaria, July 17; still sick in quarters July 31.

No. 40. Company not given: Typhoid fever, July 17; still sick in quarters July 31.

No. 41. Company I: Malaria, July 18; sent to division hospital without date; further information not given.

No. 42. Company B: Malaria, July 18; still sick in quarters July 31.

No. 43. Company H: Typhoid fever, July 19; died in Leiter Hospital July 19.

No. 44. Company C: Typhoid fever, July 19; furloughed from Leiter Hospital August 10.

No. 45. Company B: Typhoid fever, July 19; died in Leiter Hospital July 22.

No. 46. Company L: Typhoid fever, July 19; furloughed from Leiter Hospital August 28.

No. 47. Company M: Typhoid fever, July 19; furloughed from Leiter Hospital August 10.

No. 48. Company B: Malaria, July 20; still sick in quarters July 31.

No. 49. Company C: Malaria, July 21; still sick in quarters July 31.

No. 50. Company K: Typhoid fever, July 22; furloughed from Leiter Hospital August 16.

No. 51. Company D: Typhoid fever, July 24; furloughed from Leiter Hospital August 28.

No. 52. Company B: Typhoid fever, July 25; disposition not given.

No. 53. Company K: Typhoid fever, July 27; disposition not given.

No. 54. Company B: Typhoid fever, July 30; disposition not given.

No. 55. Company H: Remittent malaria, August 1; still sick in division hospital August 31.

No. 56. Hospital Corps: Remittent malaria, August 2 to 16.

No. 57. Company D: Remittent malaria, August 2; still sick in division hospital August 31.

No. 58. Company E: Typhoid fever, August 2; died August 17.

No. 59. Company I: Typhoid fever, August 2; still sick in division hospital August 31.

No. 60. Company G: Remittent malaria, August 2 to 17.

No. 61. Company I: Diarrhea, August 2; still sick in division hospital August 31. In hospital this man is recorded as having typhoid fever.

No. 62. Company G: Remittent malaria, August 2; furloughed from division hospital August 17. In hospital this case was diagnosed typhoid fever.

No. 63. Company D: Remittent malaria, August 2; furloughed from division hospital August 29. In hospital this case was diagnosed continued malaria.

No. 64. Company F: Remittent malaria, August 3; furloughed August 19.

No. 65. Company K: Remittent malaria, August 3 to 18.

No. 66. Company D: Remittent malaria, August 3; furloughed from division hospital August 31. In hospital this case was diagnosed typhoid fever.

No. 67. Company C: Remittent malaria, August 3; furloughed August 26.

No. 68. Company K: Remittent malaria, August 4; still sick in division hospital August 31.

No. 69. Company A: Typhoid fever, August 4; furloughed August 22.

No. 70. Company D: Remittent malaria, August 4; still sick in division hospital August 31.

No. 71. Company F: Typhoid fever, August 4; furloughed without date.

No. 72. Company G: Typhoid fever, August 5; sent to division hospital August 17; further disposition not given.

No. 73. Company D: Typhoid fever, August 5; furloughed from division hospital September 13.

No. 74. Company F: Remittent malaria, August 5; furloughed August 19.

No. 75. Company D: Typhoid fever, August 7; furloughed from Leiter Hospital August 31.

No. 76. Company F: Typhoid fever, August 7; furloughed without date.

No. 77. Company D: Typhoid fever, August 7; furloughed from division hospital August 29.

No. 78. Company H: Typhoid fever August 7; furloughed from division hospital October 3.

No. 79. Company H: Remittent malaria, August 8; sick in division hospital August 31.

No. 80. Company I: Intermittent malaria, August 8; still sick in division hospital August 31.

No. 81. Company A: Typhoid fever, August 8; still sick in Sternberg Hospital August 31.

No. 82. Company F: Remittent malaria, August 9 to 29.

No. 83. Company E: Remittent malaria, August 9; furloughed from division hospital September 14. In hospital this case was diagnosed typhoid fever.

No. 84. Company G: Malaria, August 11; furloughed from division hospital September 14. In hospital this case was diagnosed typhoid fever.

No. 85. Company L: Remittent malaria, August 12; furloughed from Sternberg Hospital September 3. In hospital this case was diagnosed typhoid fever.

No. 86. Company G: Remittent malaria, August 12 to 30.

No. 87. Company K: Typhoid fever, August 12; furloughed from division hospital August 29.

No. 88. Company M: Typhoid fever, August 12; furloughed from division hospital August 29.

No. 89. Company M: Remittent malaria, August 13; furloughed from division hospital September 28.

No. 90. Company A: Typhoid fever, August 13; sent to division hospital without date; further information not given.

No. 91. Company I: Remittent malaria, August 13; still sick in division hospital August 31.

No. 92. Company E: Remittent malaria, August 14; still sick in division hospital August 31.

No. 93. Company E: Remittent malaria, August 14; still sick in hospital September 23.

No. 94. Company B: Remittent malaria, August 14; furloughed from division hospital September 5. In hospital this case was diagnosed typhoid fever.

No. 95. Company B: Remittent malaria, August 15; still sick in division hospital August 31.

No. 96. Company B: Typhoid fever, August 15; died. Date of death is not given.

No. 97. Company B: Remittent malaria, August 15; still sick in division hospital August 31.

No. 98. Company M: Remittent malaria, August 15; furloughed from division hospital August 29. In hospital this case was diagnosed typhoid fever.

No. 99. Company M: Remittent malaria, August 15; furloughed without date.

No. 100. Company L: Typhoid fever, August 16; furloughed from division hospital August 31.

No. 101. Company H: Typhoid fever, August 16; furloughed from division hospital August 29.

No. 102. Company C: Remittent malaria, August 16; furloughed from Sternberg Hospital August 23.

No. 103. Company L: Remittent malaria, August 16; still sick in division hospital August 31.

No. 104. Company K: Typhoid fever, August 16; still sick in division hospital August 31.

No. 105. Company G: Remittent malaria, August 16; still sick in division hospital August 31.

No. 106. Company I: Typhoid fever, August 16; furloughed from division hospital August 29.

No. 107. Company K: Diarrhea, August 16; still sick in division hospital August 31.

No. 108. Company L: Remittent malaria, August 17; furloughed without date.

No. 109. Company I: Remittent malaria, August 17; furloughed August 30.

No. 110. Company D: Remittent malaria, August 17 to September 12.

No. 111. Company G: Remittent malaria, August 17; still sick in division hospital August 31.

No. 112. Company D: Indigestion, August 17; furloughed from Sternberg Hospital October 23. In hospital this case was diagnosed typhoid fever.

No. 113. Company B: Typhoid fever, August 17; furloughed from division hospital September 12.

No. 114. Company G: Remittent malaria, August 17; furloughed from Sternberg Hospital September 26. In hospital this case was diagnosed typhoid fever.

No. 115. Company B: Typhoid fever, August 17; died. Date of death is not given.

No. 116. Company K: Remittent malaria, August 17; furloughed from division hospital September 14. In hospital this case was diagnosed typhoid fever.

No. 117. Company G: Remittent malaria, August 17; furloughed without date.

No. 118. Company B: Remittent malaria, August 17; furloughed without date.

No. 119. Company B: Remittent malaria, August 18 to September 4.

No. 120. Company D: Remittent malaria, August 18 to September 1.

No. 121. Company G: Remittent malaria, August 18; died in division hospital September 5. In hospital this case was diagnosed typhoid fever.

No. 122. Company H: Remittent malaria, August 18; furloughed without date.

No. 123. Company A: Typhoid fever, August 18; disposition not given.

No. 124. Company F: Remittent malaria, August 18; furloughed without date.

No. 125. Company G: Remittent malaria, August 18; furloughed from division hospital September 14. In hospital this case was diagnosed typhoid fever.

No. 126. Company L: Remittent malaria, August 19; still sick in division hospital August 31.

No. 127. Company E: Typhoid fever, August 19; furloughed from Sternberg Hospital September 30.

No. 128. Company A: Typhoid fever, August 19; furloughed from Sternberg Hospital September 8.

No. 129. Company D: Continued malaria, August 19; furloughed from Leiter Hospital September 10.

No. 130. Company L: Remittent malaria, August 19; furloughed from division hospital September 14. In hospital this case was diagnosed typhoid fever.

No. 131. Company A: Typhoid fever, August 19; furloughed from Sternberg Hospital August 26.

No. 132. Company G: Remittent malaria, August 20; furloughed August 27.

No. 133. Company C: Remittent malaria, August 20; furloughed August 30.

No. 134. Company G: Intermittent malaria, August 20; furloughed August 31.

No. 135. Company L: Remittent malaria, August 20; furloughed August 28.

No. 136. Company G: Typhoid fever, August 20; furloughed September 14.

No. 137. Company D: Remittent malaria, August 20 to September 15.

No. 138. Company B: Remittent malaria, August 20; furloughed without date.

No. 139. Company E: Remittent malaria, August 20; furloughed August 27.

No. 140. Company L: Remittent malaria, August 20; furloughed without date.

No. 141. Company G: Remittent malaria, August 20; furloughed August 31.

No. 142. Company A: Remittent malaria, August 20; furloughed from division hospital September 20. In hospital this case was diagnosed typhoid fever.

No. 143. Company B: Remittent malaria, August 20 to September 15.

No. 144. Company D: Remittent malaria, August 20; furloughed August 30.

Swanders, James E.....	Pvt., band	July 31	Camp Thomas, Ga....	Do.
Werden, Ralph E.....	Corpl., B.	June 14do.....	Measles and meningitis.

This gives a total of 23 deaths, 21 of which were certainly due to typhoid fever.

Percentage of deaths among probable cases (294) of typhoid fever, 7.14.

Percentage of deaths among recognized cases (95) of typhoid fever, 22.10.

COMMUNICATIONS FROM THE SURGEONS OF THE TWENTY-FIRST KANSAS VOLUNTEER INFANTRY.

Medical officers.

Frank Armstrong, major and surgeon, Eldorado, Kans.

Thomas C. Biddle, captain and assistant surgeon, Topeka, Kans.

Frederick W. Turner, captain and assistant surgeon, Marysville, Kans.

Captain Biddle states:

As to the cause of the typhoid-fever epidemic, I think we might use the laconic expression they "drank it." The sinks were exceedingly insanitary. The rock was so near the surface that it

was practically impossible to dig the sinks with the means at hand to a sufficient depth. They were left entirely open, and they had to be filled and new ones dug so frequently that soon large areas about the camp were dug up and occupied by these sinks. No disinfectant of any kind was available. The same condition prevailed throughout the park. The limestone formation was filled with innumerable crevices and small caves, and by digging into many of these crevices and caves surface water could be found, and owing to the insufficient supply the men would, in violation of orders, drink this water, although it was nothing more nor less than the leaching from sinks. The water for our regiment was drawn from springs situated from 3 to 7 miles from the camp. A team could not make more than from two to three trips a day. We did not have sufficient barrels to store the water. At no time did we have more than two barrels to the company. After we had exhausted all efforts to draw additional barrels we tried to buy them with private funds, but found that none were to be purchased. Orders were issued to boil all drinking water, but this was impracticable from want of utensils for boiling and receivers for storing. After several weeks a well was sunk near our camp, and this partially relieved the situation. However, it is doubtful if the wells in the park were not practically sewers for the thousands of sinks located there. The flies also aided in spreading of the disease. I have never seen them so numerous elsewhere. When the men were eating the flies would fairly swarm on their food. The atmosphere was laden with dust both day and night, and it is presumable that many germs of typhoid fever were carried with the dust.

TWELFTH NEW YORK VOLUNTEER INFANTRY.

Second Brigade, Third Division, First Army Corps.

This regiment assembled at the State encampment at Peekskill, N. Y., May 2, and remained there until May 17. On the latter date it started for Chickamauga Park, Ga., at which place it arrived May 20.

The May report is signed by Thomas Chalmers, first lieutenant and assistant surgeon, acting surgeon of the regiment. Lieutenant Chalmers makes the following statement:

Diarrhea has been the most prevalent disease and has in many cases been due to improperly cooked food, many of the company cooks being inexperienced. The water supply has undoubtedly not been of the best and is also accountable for illness to some extent.

CONDENSED SICK REPORT FOR MAY.

Mean strength.....	1,023
Acute diarrhea.....	68
Tertian malaria.....	4
Intestinal colic.....	12
Other diseases.....	62
Total.....	146

The June report is signed by George G. Ward, jr., major and surgeon, who makes the following statement:

The prevailing disease has been diarrhea, due to the changed mode of living and unusual diet and the water. The meals at first were poorly prepared, due to inexperienced cooks, and many cases of illness were undoubtedly due to the irritating nature of the food. Many cases of diarrhea occurred, and all have yielded to diet, especially malted milk, which has been provided by regimental money, and to medication with bismuth, camphor, and opium. All water has been ordered boiled.

CONDENSED SICK REPORT FOR JUNE.

Mean strength	1, 238
Acute diarrhea	184
Malaria	10
Intermittent malaria	1
Tertian malaria	1
Intestinal colic	18
Acute indigestion	5
Subacute gastritis	1
Other diseases	227
Total	447

In the July report Major Ward makes the following statement:

This regiment has been in Chickamauga Park during this month, and the unhealthy condition of the soil, due to the fact that the regiment has encamped under trees for such a long period of time, and to infected water supply, has caused the large number of malarial and typhoid fever cases. This regiment should be removed from this locality at once.

CONDENSED SICK REPORT FOR JULY.

Mean strength	1, 299
Acute diarrhea	98
Malaria	64
Intermittent fever	10
Remittent fever	3
Intestinal colic	4
Acute indigestion	3
Enteric fever	1
Chills and fever	1
Typhoid fever	1
Other diseases	22
Total	207

From the remarks made by Major Ward, and quoted above, it certainly would be inferred that a number of cases of typhoid fever appeared in this regiment during the month of July, and yet only one case is recorded in the sick report. This is not the first time that we have observed that a regimental surgeon recognized the presence of typhoid fever in his regiment, but failed to diagnose the disease properly in his reports.

The August report is signed by Capt. T. C. Chalmers, who makes the following statement:

The prevailing diseases during this month were typhoid fever and malarial fever. The command left Chickamauga Park, Ga., on the 23d of August and arrived at Camp Hamilton, Lexington, Ky., on the 24th of August.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength	1, 297
Acute diarrhea	60
Malaria	2
Intermittent fever	28
Remittent fever	188
Enteric fever	38
Acute indigestion	2
Intestinal colic	1
Other diseases	36
Total	355

The fact that there is again a contradiction between the comments made by the surgeon and his sick report is evident. In his remarks, he states that the prevailing diseases during the month were typhoid fever and malarial fever, and yet typhoid does not occur in his report. In the report he calls this disease enteric fever. Of course enteric and typhoid fever are used by many physicians as synonyms, and we thus interpret the diagnosis of enteric fever in this report.

The September report is also signed by Captain Chalmers, who makes the following statement:

The health and general condition of the men of this regiment are far improved over last month's condition. The prevailing diseases for this month were typhoid fever and malarial fever.

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength	1, 261
Acute diarrhea	56
Remittent fever	159
Intermittent fever	3
Enteric fever	6
Undetermined fever	4
Acute indigestion	13
Intestinal colic	2
Fever and diarrhea	3
Convalescent typhoid	1
Other diseases	39
Total	286

There is no sick report for this regiment for the month of October.

The report for November is signed by Maj. T. C. Chalmers, with the following statement:

The command moved from Camp Hamilton, Lexington, Ky., November 13 and arrived in Camp Gilman, Americus, Ga., on the 15th day of November. The prevailing diseases during this month have been bronchitis and muscular rheumatism. One death occurred during this month, and this was due to suicide. The sanitary condition of this camp is excellent and the health of the command generally improved.

CONDENSED SICK REPORT FOR NOVEMBER.

Mean strength	1, 145
Acute diarrhea	21
Malarial fever	30
Remittent fever	5
Intermittent fever	8
Enteric fever	1
Undetermined fever	6
Acute indigestion	6
Typhoid fever	1
Convalescent typhoid	3
Other diseases	122
Total	203

The following is a list of the recognized and probable typhoid fever cases in this regiment:

- No. 1. Company A: Acute diarrhea, June 6 to 16.
- No. 2. Company M: Acute diarrhea, June 11 to 22.
- No. 3. Company B: Acute diarrhea, June 19 to 29.
- No. 4. Company K: Malarial fever, without date; sent to divi-

sion hospital June 27. There is no record of this man having been returned to duty at any time.

No. 5. Company L: Malarial fever, without date; sent to division hospital June 27; returned to duty August 1.

No. 6. Company F: Malaria, July 2 to 13.

No. 7. Company M: Diarrhea, July 2; still sick in hospital July 31.

No. 8. Company C: Diarrhea, July 2 to 26.

No. 9. Company K: Remittent malaria, July 3; furloughed August 22.

No. 10. Company B: Without date or diagnosis; sent to division hospital July 3. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 18.

No. 11. Company K: Without date or diagnosis; sent to Leiter Hospital July 3. Here the disease was diagnosed as intermittent malaria, and the patient was furloughed July 18.

No. 12. Company F: Chills and fever, July 4; returned to duty July 30.

No. 13. Company B: Diarrhea, July 4 to August 19.

No. 14. Company B: Acute indigestion, July 5; still sick in hospital July 31.

No. 15. Company B: Diarrhea, July 6 to 28.

No. 16. Company G: Diarrhea, July 7; still sick in hospital July 31.

No. 17. Company B: Remittent malaria, July 9 to 22.

No. 18. Company G: Diarrhea, July 9 to 31.

No. 19. Company G: Diarrhea, July 9; still sick in hospital July 31.

No. 20. Company A: Malaria, July 9; sent to Leiter Hospital July 19. Here the diagnosis was changed to typhoid fever, and the patient was furloughed August 20.

No. 21. Company C: Diarrhea, July 10 to 21.

No. 22. Company M: Remittent malaria, July 11; furloughed August 30.

No. 23. Company F: Intermittent malaria, July 12; sent to Leiter Hospital July 19. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 15.

No. 24. Company G: Diarrhea, July 12; still sick in hospital July 31.

No. 25. Company M: Malaria, July 12; sent to Leiter Hospital July 19. Here the diagnosis was changed to typhoid fever, and the patient was furloughed August 28.

No. 26. Company B: Malaria, July 13; sick in hospital July 31.

No. 27. Company G: Malaria, July 14; sick in hospital July 31.

No. 28. Company G: Remittent malaria, July 14; furloughed August 4.

No. 29. Company G: Diarrhea, July 14; sick in hospital July 31.

No. 30. Company A: Typhoid fever, July 14; sick in hospital July 31.

No. 31. Company E: Typhoid fever, July 14; furloughed August 22.

No. 32. Company M: Intermittent malaria, July 14; sick in hospital July 31.

No. 33. Company B: Remittent malaria, July 15; still sick at Fort Thomas November 16.

No. 34. Company G: Diarrhea, July 16; sick in hospital July 31.

No. 35. Company K: Diarrhea, July 16; sick in hospital July 31.

No. 36. Company A: Diarrhea, July 16; sick in hospital July 31.

No. 37. Company A: Diarrhea, July 17; sick in hospital July 31.

No. 38. Company L: Diarrhea, July 17; sick in hospital July 31.

No. 39. Company M: Diarrhea, July 17; sick in hospital July 31.

No. 40. Company G: Enteric fever, July 18; duty August 2.

No. 41. Company H: Diarrhea, July 18 to 31.

No. 42. Company F: Diarrhea, July 18; sick in hospital July 31.

No. 43. Company F: Diarrhea, July 19; sent to Leiter Hospital July 24. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 6.

No. 44. Company B: Without date or diagnosis; sent to Leiter Hospital July 19. Here the disease was diagnosed typhoid fever, and the patient was furloughed August 10.

No. 45. Company B: Without date or diagnosis; sent to Leiter Hospital July 19. Here a diagnosis of typhoid fever was made, and the patient was furloughed August 17.

No. 46. Company G: Without date or diagnosis; sent to Leiter Hospital July 19. Here the disease was diagnosed as typhoid fever, and the patient was furloughed August 18.

No. 47. Company M: Without date or diagnosis; sent to Leiter Hospital July 19. Here the disease was diagnosed as typhoid fever, and the patient was furloughed September 9.

No. 48. Company H: Intermittent malaria, July 20; still sick August 31.

No. 49. Company M: Malaria, July 20; still sick August 31.

No. 50. Company B: Enteric fever, July 20; furloughed August 13. This man returned at the expiration of his furlough; still sick, and was again furloughed November 1.

No. 51. Company E: Enteric fever, July 20; furloughed August 22.

No. 52. Company E: Intermittent malaria, July 20; still sick August 31.

No. 53. Company F: Diarrhea, July 21; still sick August 31.

No. 54. Company A: Intermittent malaria, July 21; still sick August 31.

No. 55. Company G: Typhoid fever, July 22; died August 6.

No. 56. Company G: Malaria, July 22; still sick August 31.

No. 57. Company I: Typhoid fever, July 22 to August 22.

No. 58. Company M: Typhoid fever, July 24; returned to duty August 13.

No. 59. Company L: Typhoid fever, July 24 to August 22.

No. 60. Company F: Malaria, July 25; sick in hospital August 31.

No. 61. Company G: Typhoid fever, July 25 to August 22.

No. 62. Company L: Typhoid fever, July 25 to August 11.

No. 63. Company L: Remittent malaria, July 25 to August 18.

No. 64. Company L: Enteric fever, July 26; furloughed August 7.

No. 65. Company K: Remittent malaria, July 26; still sick August 31.

No. 66. Company I: Typhoid fever, July 27 to August 17.

No. 67. Company H: Typhoid fever, July 28 to August 17.

No. 68. Company E: Malaria, July 28; sent to Sternberg Hospital August 16. Here the diagnosis was changed to typhoid fever and the patient was furloughed August 29.

No. 69. Company L: Remittent malaria, July 29 to August 12.

No. 70. Company A: Malaria July 30; furloughed August 10.

No. 71. Company H: Typhoid fever, July 30; died August 15.

No. 72. Company C: Typhoid fever, July 30; sick in hospital August 31.

No. 73. Company G: Typhoid fever, July 30 to August 30.

No. 74. Company A: Remittent malaria, July 31 to August 17.

No. 75. Company G: Remittent malaria, August 1; sick in hospital August 31.

No. 76. Company G: Enteric fever, August 1; sick in hospital August 31.

No. 77. Company M: Diarrhea, August 1 to 14.

No. 78. Company I: Intermittent malaria, August 1 to 22.

No. 79. Company K: Malaria, August 1 to 12.

No. 80. Company H: Remittent malaria, August 2 to 22.

No. 81. Company H: Remittent malaria, August 2 to 12.

No. 82. Company I: Remittent malaria, August 2; still sick October 31.

No. 83. Company G: Remittent malaria August 2; furloughed September 18.

No. 84. Company D: Remittent malaria, August 3; died August 14.

No. 85. Company H: Remittent malaria, August 3; sent to division hospital August 22. Here the disease was diagnosed typhoid fever, and the patient was furloughed, October 27.

No. 86. Company H: Enteric fever, August 3; sick in hospital August 31.

No. 87. Company K: Remittent malaria August 3; furloughed August 14.

No. 88. Company G: Without date or diagnosis; sent to division hospital August 3. Here the disease was diagnosed as remittent malaria, and the patient was furloughed September 9.

No. 89. Company G: Diarrhea, August 3 to 23.

No. 90. Company M: Remittent malaria, August 3 to 25.

No. 91. Company D: Remittent malaria, August 3; sent to Sternberg Hospital August 16. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 7.

No. 92. Company F: Remittent malaria, August 3; sick in hospital August 31.

No. 93. Company G: Diarrhea, August 3; sick in hospital August 31.

No. 94. Company E: Remittent malaria, August 3 to 14.

No. 95. Company L: Remittent malaria, August 3; sick in hospital August 31.

No. 96. Company K: Remittent malaria, August 3; sick in hospital August 31.

No. 97. Company M: Remittent malaria, August 3 to 25.

No. 98. Company E: Remittent malaria, August 3 to 15.

No. 99. Company H: Remittent malaria, August 3; sent to Sternberg Hospital August 19. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 21.

No. 100. Company E: Without date or diagnosis; sent to division hospital August 4. Here the disease was diagnosed as typhoid fever, and the patient was furloughed September 14.

No. 101. Company C: Remittent malaria, August 4; sent to division hospital August 21. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 8.

No. 102. Company F: Remittent malaria, August 4; sick in hospital August 31.

No. 103. Company E: Remittent malaria, August 4; still sick in hospital August 31.

No. 104. Company A: Without date or diagnosis; sent to division hospital August 5. Here the disease was diagnosed remittent malaria, and the patient was furloughed August 29.

No. 105. Company M: Remittent malaria, August 6 to 25.

No. 106. Company I: Diarrhea, August 6 to 16.

No. 107. Company H: Diarrhea, August 6; sent to Sternberg Hospital August 16. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 1.

No. 108. Company A: Remittent malaria, August 7; sent to Sternberg Hospital August 19. Here the diagnosis was changed to typhoid fever, and the patient was furloughed August 27.

No. 109. Company I: Remittent malaria, August 7; sent to division hospital August 12. Here the disease was diagnosed as typhoid fever, and the patient was furloughed September 20.

No. 110. Company H: Diarrhea, August 8; sick in hospital August 31.

No. 111. Company H: Diarrhea August 8; sent to division hospital August 10. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 13.

No. 112. Company M: Remittent malaria, August 8; sent to division hospital August 16. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 20.

No. 113. Company C: Remittent malaria, August 8; still sick in hospital August 31.

No. 114. Company H: Remittent malaria, August 8 to 22.

No. 115. Company B: Remittent malaria, August 9; furloughed August 22.

No. 116. Company F: Remittent malaria, August 9; sent to division hospital August 13. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 18.

No. 117. Company E: Enteric fever, August 10; still sick in hospital August 31.

No. 118. Company B: Enteric fever, August 10; still sick in hospital August 31.

No. 119. Company G: Remittent malaria, August 10 to 22.

No. 120. Company B: Typhoid fever, August 10; still sick in Sternberg Hospital September 23.

No. 121. Company B: Remittent malaria, August 11; furloughed August 22.

No. 122. Company E: Remittent malaria, August 11 to 22.

No. 123. Company I: Remittent malaria, August 11; still sick in hospital August 31.

No. 124. Company K: Intermittent malaria, August 11; still sick in hospital August 31.

No. 125. Company L: Malaria, August 11; still sick in hospital August 31.

No. 126. Company D: Remittent malaria, August 11; still sick in hospital August 31.

No. 127. Company H: Remittent malaria, August 11; still sick in hospital August 31.

No. 128. Company L: Remittent malaria, August 12; furloughed August 23.

No. 129. Company I: Remittent malaria, August 12; sent to division hospital August 17. Here the diagnosis was changed to typhoid fever, and the patient was sent to Sternberg Hospital September 23.

No. 130. Company H: Remittent malaria, August 12; sent to Sternberg Hospital August 19. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 17.

No. 131. Company F: Remittent malaria, August 12; still sick in hospital August 31.

No. 132. Company D: Enteric fever, August 13; still sick in hospital August 31.

No. 133. Company F: Without date or diagnosis; sent to division hospital August 13. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 13.

No. 134. Company L: Remittent malaria, August 14; sent to Sternberg Hospital August 19. Here the diagnosis was changed to typhoid fever, and the patient was furloughed August 23.

No. 135. Company I: Diarrhea, August 15; still sick in hospital August 31.

No. 136. Company B: Remittent malaria, August 15; still sick in hospital August 31.

No. 137. Company B: Without date or diagnosis; sent to division hospital August 16. Here the disease was diagnosed typhoid fever, and the patient was sent to Sternberg Hospital September 23.

No. 138. Company H: Without date or diagnosis; sent to division hospital August 16. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 20.

No. 139. Company D: Without date or diagnosis; sent to Sternberg Hospital August 16. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 15.

No. 140. Company H: Without date or diagnosis; sent to Sternberg Hospital August 16. Here the disease was diagnosed remittent malaria, and the patient was furloughed August 27.

No. 141. Company L: Remittent malaria, August 16; sent to division hospital August 18. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 13.

No. 142. Company B: Remittent malaria, August 16; still sick in hospital August 31.

No. 143. Company G: Without date or diagnosis; sent to Sternberg Hospital August 16. Here the disease was diagnosed typhoid fever, and the patient was furloughed August 27.

No. 144. Company F: Without date or diagnosis; sent to Sternberg Hospital August 16. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 13.

No. 168. Company D: Without date or diagnosis; sent to Leiter Hospital August 19. Here the disease was diagnosed malaria, and the patient was furloughed August 27.

No. 191. Company L: Without date or diagnosis; sent to division hospital August 23. Here the disease was diagnosed as typhoid fever, and the patient was furloughed September 13.

No. 192. Company D: Remittent malaria, August 23; still sick September 30.

No. 193. Company E: Without date or diagnosis; sent to division hospital August 23. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 13.

No. 194. Company C: Enteric fever, August 24; still sick September 30.

No. 195. Company K: Remittent malaria, August 24; still sick September 30.

No. 196. Company B: Without date or diagnosis; sent to division hospital August 24. Here the disease was diagnosed intermittent malaria, and the patient was furloughed September 17.

No. 197. Company D: Typhoid fever, August 24; still sick September 30.

No. 198. Company E: Remittent malaria, August 26; still sick September 30.

No. 199. Company H: Remittent malaria, August 26; still sick September 30.

No. 200. Company G: Remittent malaria, August 26; still sick September 30.

No. 201. Company G: Without date or diagnosis; sent to division hospital August 26. Here the disease was diagnosed remittent malaria, and the patient was furloughed September 30.

No. 202. Company D: Remittent malaria, August 26; still sick September 30.

No. 203. Company F: Without date or diagnosis; sent to division hospital August 26; still sick September 17.

No. 204. Company L: Without date or diagnosis; sent to division hospital August 27. Here the disease was diagnosed typhoid fever, and the patient was furloughed October 27.

No. 205. Company F: Without date or diagnosis; sent to division hospital August 27. Here the disease was diagnosed typhoid fever, and the patient was returned to sick quarters September 27.

No. 206. Company K: Typhoid fever, August 27; furloughed from Sternberg Hospital October 11.

No. 207. Company E: Without date or diagnosis; sent to division hospital August 27. Here the disease was diagnosed typhoid fever, and the patient was furloughed October 18.

No. 208. Company D: Typhoid fever, August 27; still sick September 30.

No. 209. Company B: Without date or diagnosis; sent to division hospital August 27. Here the disease was diagnosed typhoid fever, and the patient was furloughed October 9.

No. 210. Company B: Typhoid fever, August 27; still sick September 30.

No. 211. Company L: Enteric fever, August 28; still sick September 30.

No. 212. Company L: Enteric fever, August 28; still sick September 30.

No. 213. Company E: Remittent malaria, August 28; still sick September 30.

No. 214. Company I: Remittent malaria, August 28; still sick September 30.

No. 215. Company M: Without date or diagnosis; sent to division hospital August 28; still sick September 30.

No. 216. Company E: Enteric fever, August 28; died September 22.

No. 217. Company M: Remittent malaria, August 28; still sick September 30.

No. 218. Company K: Remittent malaria, August 28; still sick in quarters September 13.

No. 219. Company B: Typhoid fever, August 28; still sick September 30.

No. 220. Company M: Remittent malaria, August 28; still sick September 30.

No. 221. Company K: Remittent malaria, August 28; still sick September 30.

No. 222. Company C: Remittent malaria, August 28; sick in quarters September 10.

No. 223. Company I: Without date or diagnosis; sent to division hospital August 28. Here the disease was diagnosed remittent malaria, and the patient remained sick September 30.

No. 224. Company G: Remittent malaria, August 28; still sick in hospital September 29.

No. 225. Company I: Remittent malaria, August 28; still sick September 30.

No. 226. Company E: Remittent malaria, August 28; still sick September 30.

No. 227. Company D: Indigestion, August 29; still sick September 30.

No. 228. Company E: Remittent malaria, August 29; still sick September 19.

No. 229. Company L: Remittent malaria, August 29; sent to division hospital August 29. Here the diagnosis was changed to typhoid fever, and the patient was furloughed October 27.

No. 230. Company K: Remittent malaria, August 29; still sick September 30.

No. 231. Company M: Remittent malaria, August 29; sent to division hospital August 29. Here the diagnosis was changed to typhoid fever, and the patient was furloughed October 6.

No. 232. Band: Remittent malaria, August 29; still sick September 17.

No. 233. Company L: Without date or diagnosis; sent to division hospital August 29. Here the disease was diagnosed typhoid fever, and the patient was placed on a hospital train September 9.

No. 234. Company A: Remittent malaria, August 29; still sick September 30.

No. 235. Company E: Remittent malaria, August 29; still sick September 17.

No. 236. Company M: Indigestion, August 29; still sick September 30.

No. 237. Company L: Without date or diagnosis; sent to division hospital August 29. Here the disease was diagnosed typhoid fever, and the patient died September 19.

No. 469. Company C: Without date or diagnosis; sent to division hospital October 22. Here the disease was diagnosed typhoid fever, and the patient was transferred to Fort Thomas November 2.

No. 470. Company A: Without date or diagnosis; sent to division

hospital October 22. Here the disease was diagnosed remittent malaria, and the patient was transferred to Fort Thomas November 2.

No. 471. Without company, date, or diagnosis; sent to division hospital October 23. Here the disease was diagnosed as remittent malaria and the patient had not been returned to duty November 30.

No. 472. Company M: Typhoid fever, October 27 to November 13.

No. 473. Company C: Remittent malaria, October 29 to November 18.

No. 474. Company D: Malaria and gripe, October 30 to November 11.

No. 475. Company D: Malaria, October 30 to November 19.

No. 476. Company G: Typhoid fever, November 4; disposition not given.

No. 477. Company D: Typhoid fever, November 4; disposition not given.

No. 478. Company K: Malaria, November 4 to 19.

No. 479. Company E: Remittent malaria, November 5 to 27.

No. 480. Company G: Malaria, November 5 to 19.

No. 481. Company K: Remittent malaria, November 6 to 19.

No. 482. Company E: Remittent malaria, November 7 to 26.

No. 483. Company A: Malaria, November 8 to 19.

No. 484. Company B: Undetermined fever, November 17; still sick November 30.

No. 485. Company B: Undetermined fever, November 18; still sick November 30.

No. 486. Company C: Undetermined fever, November 21; still sick in brigade hospital November 30.

No. 487. Company A: Undetermined fever, November 21; still sick in brigade hospital November 30.

No. 488. Company L: Malaria, November 23; still sick in brigade hospital November 30.

No. 489. Company D: Malaria, November 24; still sick in brigade hospital November 30.

No. 490. Company B: Malaria, November 26; still sick in brigade hospital November 30.

SUMMARY.

Assembled at Peekskill, N. Y., May 2, 1898.

Mustered into United States service about May 10, 1898.

Arrived at Chickamauga Park, Ga., May 20, 1898.

Strength on arrival, 1,023.

Date of first case of probable typhoid fever, June 6, 1898.

Date of first case of recognized typhoid fever, July 3, 1898.

Left Chickamauga Park August 25, 1898.

Strength at departure, 1,302.

Number of cases of probable typhoid fever developed at Chickamauga..... 197

Arrived at Lexington, Ky., August 26, 1898.

Left Lexington, Ky., November 13, 1898.

Number of cases developed at Lexington, Ky..... 286

Arrived at Americus, Ga., November 13, 1898.

Number of cases of probable typhoid fever developed at Americus, Ga., in November 7

Total number of cases of probable typhoid fever developed in the Twelfth New York Volunteer Infantry from May to November 490

These 490 cases were diagnosed as follows:

Typhoid fever..... 144

Malaria..... 268

Diarrhea..... 47

Chills and fever..... 18

Indigestion..... 13

Total..... 490

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Bender, Robert.....	Pvt., I.	1898. Aug. 27	Field Hospital.....	Enteric fever.
Byrne, Edward R....	Corpl., M.	Sept. 12	New York City.....	Typhoid.
Cathie, Albert H....	Pvt., E.	Sept. 2	do.....	Do.
Cook, William H....	Corpl., K.	Sept. 7	Camp Hamilton, Ky..	Do.
Coughlin, Daniel J..	Pvt., H.	Aug. 22	Camp Thomas, Ga....	Do.
Dame, Chas. H.....	Pvt., E.	Sept. 21	Camp Hamilton, Ky..	Do.
Doherty, William....	Corpl., C.	1899. Mar. 9	Hospital ship <i>Missouri</i>	Typhoid, complicated with malarial poisoning.
Doucett, Michael....	Pvt., I.	1898. Oct. 8	Camp Hamilton, Ky..	Typhoid.
Dow, Ralph Henry...	Pvt., H.	July 29	Camp Thomas, Ga....	Do.
Esterhazy, Albert....	Pvt., G.	1899. Jan. 14	Seton Sanitarium, Spuyten Duyvil, N.Y.	No cause given.
Fish, H. Albert.....	Pvt., E.	1898. Sept. 9	Camp Hamilton, Ky..	Typhoid.
Fitzgibbons, Wm. J..	Artl., H.	July 19	Camp Thomas, Ga....	Do.
Heitman, Frank E....	Pvt., G.	Sept. 17	New York City.....	Do.
Hone, Phillips.....	Corpl., H.	Aug. 15	do.....	Do.
Johnson, Andrew....	Pvt., G.	Oct. 9	Camp Hamilton, Ky..	Do.
McQuade, J. L.....	Pvt., L.	Aug. 31	Chickamauga, Ga....	Do.
Martin, Wm. H., jr...	Corpl., G.	Oct. 12	New York Hospital, N.Y.	Do.
Mersereau, Wm.....	Pvt., G.	1899. Mar. 31	Fort Columbus, N. Y..	Do.
Morris, Jas. A.....	Pvt., L.	1898. Sept. 19	Camp Hamilton, Ky..	Do.
Rossmussen, Soren P.	Pvt., D.	Sept. 26	do.....	Do.
Strauss, Wm., jr.....	Corpl., G.	Aug. 6	Fort McPherson.....	Do.

This gives a total of 21 deaths, 20 of which were due to typhoid fever.

Percentage of deaths among probable cases (490) of typhoid fever, 4.08.

Percentage of deaths among recognized cases (144) of typhoid fever, 13.89.

COMMUNICATIONS FROM THE SURGEONS OF THE TWELFTH NEW YORK VOLUNTEER INFANTRY.

Medical officers.

Thomas C. Chalmers, major and surgeon, New York City, N. Y.

Jesse S. de Muth, lieutenant and assistant surgeon, New York City, N. Y.

Thomas C. McCleave, lieutenant and assistant surgeon, Berkeley, Cal.

Major Chalmers states:

It was impossible to make a diagnosis of typhoid fever on account of the short time the patients were under observation, it being the custom to transfer all suspicious cases to the general hospital immediately. Lieutenant de Muth, who was in charge, used the terms "enteric fever" and "typhoid fever" as synonymous. The sick report for October was forwarded by him to the Surgeon-General. I do not agree with you in the probable number of cases of typhoid fever in this regiment. I do not regard chills and fever and indigestion as coming under this head, nor do I think that all cases diagnosed malaria should be credited as probable typhoid fever. After my return to the regiment, October 1, 1898, at Lexington, Ky., where they were encamped, boiled water was used almost entirely by the men of this regiment. The water used at Lexington, Americus, and Matanzas was city water, piped to the camp, boiled and iced. The sinks were thoroughly disinfected, and the floors and sides washed daily with a 1 to 500 solution of bichloride of mercury. In Matanzas the sinks emptied directly into the bay. The sick report grew smaller and smaller each month during our stay in Cuba, and for the whole of that period was less than one-half of 1 per cent.

SECOND MISSOURI VOLUNTEER INFANTRY.**Third Brigade, Third Division, First Army Corps.**

This regiment assembled and was mustered into service at Jefferson Barracks, Mo. It left this place May 18, 1898, and reached Chickamauga Park, Ga., May 20, where it remained until August 27. On the last-mentioned date it was transferred to Lexington, Ky.

Maj. Samuel K. Crawford signed all the reports from May to November, inclusive, with the exception of that for August, which was signed by Asst. Surg. Charles A. Straus.

Inasmuch as there are certain defects in these reports, and as they contain no information of value, we will omit them and will proceed at once to give a list of cases of both recognized and probable typhoid fever, which is as follows:

No. 1. Diarrhea, May 26 to June 10. This was probably a mild case of typhoid fever.

No. 2. Typhoid fever, May 27; still sick July 31. There is no record of this man later than the July report.

No. 3. Diarrhea, June 1; still sick June 30. This name does not occur on any later report.

No. 4. Remittent malaria, June 4 to June 30.

No. 5. Typhoid fever, June 7; no disposition given.

No. 6. Typhoid fever, June 9; died July 1.

No. 7. Typhoid fever, June 18 to July 24.

No. 8. Typhoid fever, June 20 to July 18.

No. 9. Typhoid fever, June 25; died July 11.

No. 10. Typhoid fever, June 26; died July 17.

No. 11. Typhoid fever, June 27; still sick June 30. This name is not found on any subsequent report.

No. 12. Typhoid fever, June 28 to October 16. This man is recorded as having had diarrhea June 7 and June 17, with no record of being returned to duty in either instance.

No. 13. Typhoid fever, June 28; no disposition given.

No. 14. Typhoid fever, June 28; disposition not given.

No. 15. Typhoid fever, June 30; sick in division hospital July 31.

No. 16. Typhoid fever, June 30; furloughed August 23.

No. 17. Typhoid fever, June 30 to July 27.

No. 18. Typhoid fever, July 1; sick in division hospital July 31.

No. 19. Typhoid fever, July 1 to September 18. This man had remittent malaria June 6 and 7.

No. 20. Typhoid fever, July 3 to September 4.

No. 21. Typhoid fever, July 4; died August 23.

No. 22. Typhoid fever, July 6; sick in hospital July 31.

No. 23. Typhoid fever, without date; sent to Fort Thomas July 6; returned to duty July 27.

No. 24. Typhoid fever, July 6; died August 10.

No. 25. Malaria, July 8 to 27. This man had cholera morbus June 3 to 9.

No. 26. Typhoid fever, July 8; sick in hospital July 31.

No. 27. Intermittent malaria, July 8 to 25. This man subsequently had malarial fever from September 9 to 30.

No. 28. Typhoid fever, July 8 to September 10.

No. 29. Typhoid fever, July 8; died September 3.

No. 30. Typhoid fever, July 10; sick in hospital July 31.

No. 31. Typhoid fever, July 11; still sick September 30.

No. 32. Typhoid fever, July 13; furloughed July 29. This man had cholera morbus May 22 to 24.

No. 33. Typhoid fever, July 13; died August 20.

No. 34. Typhoid fever, July 14; sick in division hospital July 31.

No. 35. Typhoid fever, July 14; furloughed September 6.

No. 36. Typhoid fever, July 14; furloughed without date.

No. 37. Typhoid fever, July 14 to September 21. This man had intermittent malaria July 1 to 3.

No. 38. Typhoid fever, July 14 to September 28.

No. 39. Typhoid fever, July 15; furloughed August 23. This man had cholera morbus May 23 and 24; and diarrhea June 2 to 4.

No. 40. Typhoid fever, July 15; sick in hospital July 31.

No. 41. Typhoid fever, July 16; died August 23. This man had diarrhea June 11 and 12.

No. 42. Typhoid fever, July 17; sick in hospital July 31.

No. 43. Typhoid fever, July 17; furloughed August 6.

No. 44. Typhoid fever, July 17 to August 23. This man had intermittent malaria June 5 to 8.

No. 45. Typhoid fever, July 17; furloughed August 6.

No. 46. Typhoid fever, July 19; sick in division hospital July 31. This man had intermittent malaria June 9 and 10.

No. 47. Typhoid fever, July 19; died July 29.

No. 48. Typhoid fever, July 19; sick in division hospital July 31.

No. 49. Typhoid fever, July 21; furloughed August 23.

No. 50. Typhoid fever, July 21; furloughed August 18.

No. 51. Typhoid fever, July 22; furloughed August 23.

No. 52. Typhoid fever, July 22 to September 21. This man had diarrhea June 16 to 18; intermittent malaria July 31; record incomplete.

No. 53. Typhoid fever, July 23 to September 21.

No. 54. Typhoid fever, July 23 to September 30.

No. 55. Typhoid fever, July 23; sick in hospital September 30.

No. 56. Typhoid fever, July 23; furloughed August 23.

No. 57. Typhoid fever, July 23; sick in hospital July 31.

No. 58. Typhoid fever, July 24; furloughed September 14.

No. 59. Typhoid fever, July 24; furloughed September 20.

No. 60. Typhoid fever, July 24. This name does not occur on any of the records after July.

No. 61. Typhoid fever, July 24; disposition not given.

No. 62. Typhoid fever, July 24; died August 6.

No. 63. Typhoid fever, July 25; furloughed August 23.

No. 64. Typhoid fever, July 26 to September 28.

No. 65. Typhoid fever, July 27; furloughed August 23.

No. 66. Typhoid fever, July 29; died September 15.

No. 67. Typhoid fever, July 30; furloughed August 23.

No. 68. Typhoid fever, July 31 to September 28.

No. 69. Typhoid fever, July 31; furloughed August 10.

No. 70. Typhoid fever, August 1; still sick September 30.

No. 71. Typhoid fever, August 2 to September 23. This man had cholera morbus June 7 and 8.

No. 72. Typhoid fever, August 2; furloughed September 18.

No. 73. Typhoid fever, August 2; died September 11.

No. 74. Typhoid fever, August 3 to September 21.

No. 75. Typhoid fever, August 3; furloughed August 31.

No. 76. Typhoid fever, August 3 to September 30.

No. 77. Typhoid fever, August 3 to September 21.

No. 78. Typhoid fever, August 4 to September 21. This man had malaria May 31, with incomplete record; and diarrhea June 4 and 5.

No. 79. Malaria, August 4 to September 21.

No. 80. Typhoid fever, August 4; furloughed August 25.

No. 81. Typhoid fever, August 5; died September 6.

No. 82. Typhoid fever, August 5; sick in hospital August 30.

No. 83. Typhoid fever, August 8; sent to division hospital August 17. There is no further record of this case.

No. 84. Typhoid fever, August 8; sick in hospital September 30. This man had intermittent malaria July 8 to 11.

No. 85. Typhoid fever, August 9; disposition not given.

No. 86. Malaria, August 9 to September 29.

No. 87. Typhoid fever, August 10; furloughed September 18.

No. 88. Typhoid fever, August 10; still sick September 30.

No. 89. Typhoid fever, August 10; furloughed August 23.

- No. 90. Typhoid fever, August 10; furloughed September 11.
 No. 91. Typhoid fever, August 11; still sick September 30.
 No. 92. Typhoid fever, August 11 to September 29.
 No. 93. Typhoid fever, August 11; still sick September 30.
 No. 94. Typhoid fever, August 11; still sick September 30. This man had intermittent malaria June 22 to 26.
 No. 95. Typhoid fever, August 11 to September 21.
 No. 96. Typhoid fever, August 11; sick in hospital September 30.
 No. 97. Typhoid fever, August 11; sick in hospital September 30. This man had diarrhea June 8 to 10.
 No. 98. Typhoid fever, August 12 to September 21.
 No. 99. Typhoid fever, August 12; furloughed September 13.
 No. 100. Typhoid fever, August 12 to September 29. This man had diarrhea June 10 and 11.
 No. 101. Typhoid fever, August 12; sick in hospital September 30.
 No. 102. Typhoid fever, August 12; sick in hospital September 30.
 No. 103. Typhoid fever, August 12; disposition not given.
 No. 104. Typhoid fever, August 12 to September 21.
 No. 105. Malaria, August 13 to September 21.
 No. 106. Typhoid fever, without date; sent to division hospital August 13; died September 20.
 No. 107. Typhoid fever, August 14; disposition not given.
 No. 108. Typhoid fever, August 14; disposition not given. This man had diarrhea June 7 and 8.
 No. 109. Malaria, August 15 to September 20. This man had diarrhea June 17 to 23.
 No. 110. Typhoid fever, August 15; furloughed August 25. This man had intermittent malaria July 12 and 13.
 No. 111. Typhoid fever, August 15; furloughed September 11. This man had diarrhea June 1 to 3.
 No. 112. Typhoid fever, August 15; still sick September 30.
 No. 113. Malaria, August 15 to September 30. This man had diarrhea June 10 and 11.
 No. 114. Typhoid fever, August 15 to September 21. This man had intermittent malaria May 22 and 23; diarrhea, June 14 to 16.
 No. 115. Typhoid fever, August 16; still sick in hospital September 30. This man had intermittent malaria June 22 to 24.
 No. 116. Malaria, August 16 to September 22.
 No. 117. Typhoid fever, without date; sent to Sternberg Hospital August 16; furloughed September 13.
 No. 118. Typhoid fever, August 16; furloughed August 29.
 No. 119. Typhoid fever, without date; sent to Sternberg Hospital August 16; died August 27.
 No. 120. Typhoid fever, August 16; furloughed August 23. This man had diarrhea July 12 to 14.
 No. 121. Typhoid fever, August 16 to September 21.
 No. 122. Typhoid fever, August 16 to September 25.
 No. 123. Typhoid fever, August 17; furloughed September 20.
 No. 124. Typhoid fever, August 17; furloughed August 18.
 No. 125. Typhoid fever, August 17; furloughed August 30.
 No. 126. Typhoid fever, August 18; disposition not given.
 No. 127. Typhoid fever, August 19; disposition not given.
 No. 128. Typhoid fever, August 19; died August 31.
 No. 129. Typhoid fever, August 20; furloughed August 25.
 No. 130. Typhoid fever, August 20 to September 22.
 No. 131. Typhoid fever, August 20 to September 21.
 No. 132. Malaria, without date; sent to division hospital August 20; furloughed August 30.
 No. 133. Typhoid fever, August 20; sick in hospital September 30.
 No. 134. Typhoid fever, August 20 to September 20.
 No. 135. Typhoid fever, August 22; furloughed September 16.
 No. 136. Typhoid fever, August 22; disposition not given.
 No. 137. Malaria, August 22 to September 25.
 No. 138. Typhoid fever, August 23; furloughed September 15.
 No. 139. Typhoid fever, August 23; furloughed August 25. This man had intermittent malaria July 10 and 11.
 No. 140. Typhoid fever, August 23; in hospital September 30. This man had diarrhea June 4 to 7.
 No. 141. Typhoid fever, August 24; furloughed September 13. This man had diarrhea May 22 and 23.
 No. 142. Typhoid fever, August 24; disposition not given. This man had diarrhea June 7 and 8.
 No. 143. Typhoid fever, August 24; sick in hospital September 30.
 No. 144. Typhoid fever, August 24; disposition not given. This man had diarrhea June 4 to 9.
 No. 145. Typhoid fever, August 25; sick in hospital September 30. This man had cholera morbus June 9 and 10.
 No. 146. Typhoid fever, August 26; furloughed September 20.
 No. 147. Typhoid fever, August 26; disposition not given.
 No. 148. Typhoid fever, August 26; furloughed September 20.
 No. 149. Typhoid fever, August 26; still sick in division hospital September 30.
 No. 150. Typhoid fever, August 29; disposition not given.
 No. 151. Typhoid fever, August 29; disposition not given.
 No. 152. Typhoid fever, August 30; disposition not given.
 No. 153. Malaria, August 30; sick in hospital September 30.
 No. 154. Typhoid fever, without date; sent to Sternberg Hospital August 30; furloughed September 16.
 No. 155. Malaria, August 30 to September 20. This man had diarrhea May 22 to 24, and diarrhea May 30 and 31.
 No. 156. Typhoid fever, August 30; sick in hospital September 30.
 No. 157. Typhoid fever, August 31; disposition not given.
 No. 158. Typhoid fever, August 31 to September 21.
 No. 159. Typhoid fever, August 31; sick in division hospital October 31.
 No. 160. Typhoid fever, August 31; furloughed September 6.
 No. 161. Typhoid fever, August 31; disposition not given.
 No. 162. Malaria, without date; sent to hospital September 1; furloughed September 17.
 No. 163. Malaria, September 1; sick in division hospital September 30.
 No. 164. Malaria, September 1 to 28.
 No. 165. Typhoid fever, without date; sent to hospital September 1; sick in quarters October 2.
 No. 166. Malaria, September 1 to October 4.
 No. 167. Typhoid fever, September 1; furloughed September 20.
 No. 168. Malaria, September 1; still sick October 31.
 No. 169. Typhoid fever, September 2; sick in quarters September 28.
 No. 170. Typhoid fever, September 3; sick in division hospital September 30.
 No. 171. Typhoid fever, September 3; sick in hospital September 30.
 No. 172. Typhoid fever, September 3; died September 17.
 No. 173. Typhoid fever, September 4; sick in hospital September 30.
 No. 174. Malaria, September 4 to October 16.
 No. 175. Typhoid fever, September 4; sick in division hospital September 30.
 No. 176. Malaria, September 4; still sick in hospital September 30.
 No. 177. Malaria, September 4; sick in division hospital September 30.
 No. 178. Typhoid fever, September 5; disposition not given.
 No. 179. Typhoid fever, September 5 to 30.
 No. 180. Typhoid fever, September 5 to 29.
 No. 181. Malaria, September 5; sick in division hospital September 30.
 No. 182. Typhoid fever, September 5 to 30.
 No. 183. Malaria, September 5 to 19. This man had cholera morbus June 8 and 9.
 No. 184. Malaria, September 5; sick in hospital September 30.
 No. 185. Typhoid fever, September 6; sick in hospital September 30.
 No. 186. Typhoid fever, without date; sent to hospital September 6; furloughed October 11.

No. 187. Malaria, September 6; sick in hospital September 30.
 No. 188. Malaria, September 8 to 29.
 No. 189. Typhoid fever, September 8; sick in hospital September 30.
 No. 190. Malaria, September 8 to 25.
 No. 191. Malaria, September 8 to 26.
 No. 192. Malaria, September 8 to 20.
 No. 193. Malaria, September 8 to 29.
 No. 194. Malaria, September 8 to 28. This man had diarrhea May 25 to 30.
 No. 195. Malaria, September 8 to 29. This man had diarrhea May 23 and 24; intermittent malaria, September 5 to 7.
 No. 196. Malaria, September 8; sick in hospital September 30.
 No. 197. Malaria, September 8 to 21.
 No. 198. Typhoid fever, September 8 to 25. That this record, giving so many admissions on September 8, is incorrect is proved by this case. It seems that the surgeon entered upon his books cases extending through a week or more past on this date. This individual was in the division hospital as early as August 29.
 No. 199. Typhoid fever September 8; sent to Fort Thomas November 3.
 No. 200. Remittent malaria, September 8; furloughed October 6.
 No. 201. Malaria, September 8 to 29.
 No. 202. Typhoid fever, September 8; furloughed October 6.
 No. 203. Malaria, September 8; sick in hospital September 30. This man had diarrhea June 9 and 10.
 No. 204. Malaria, September 8 to 24. This man had diarrhea September 2 to 4. Undoubtedly the initial date of this typhoid fever should be given as September 2.
 No. 205. Malaria, September 8 to 30. This man had diarrhea July 17 and 18.
 No. 206. Typhoid fever, September 8; disposition not given.
 No. 207. Malaria, September 9; furloughed September 21.
 No. 208. Malaria, September 9; sick in hospital September 30.
 No. 209. Malaria, September 9; sick in hospital September 30.
 No. 210. Malaria, September 9 to 27.
 No. 211. Malaria, September 9; sick in hospital September 30.
 No. 212. Malaria, September 9 to 24. This man had diarrhea June 2 and 3.
 No. 213. Malaria, September 9 to 29. This man had diarrhea May 22 to 24.
 No. 214. Malaria, September 10; sick in hospital October 31.
 No. 215. Typhoid fever, September 10; furloughed October 27.
 No. 216. Malaria, September 10; sick in hospital September 30.
 No. 217. Malaria, September 10 to 30. This man had intermittent malaria July 8 to 10.
 No. 218. Malaria, September 10 to 25.
 No. 219. Malaria, September 10; sick in hospital September 30.
 No. 220. Malaria, September 10 to 27.
 No. 221. Malaria, September 10; sick in hospital September 30.
 No. 222. Malaria, September 10; sick in hospital September 30.
 No. 223. Malaria, September 10; sick in hospital September 30. This man had diarrhea May 30 and 31.
 No. 224. Malaria, September 11; sick in hospital September 30.
 No. 225. Malaria, September 11; sick in hospital September 30. This man had diarrhea June 2 to 4.
 No. 226. Malaria, September 12 to 29. This man had intermittent malaria September 8 to 10, and undoubtedly September 8 should be given as the initial date of his illness.
 No. 227. Malaria, September 12; furloughed October 5.
 No. 228. Malaria, September 12 to 29.
 No. 229. Malaria, September 12 to 26. This man had intermittent malaria September 10 and 11.
 No. 230. Malaria, September 12; still sick October 31.
 No. 231. Malaria, September 12 to 24.
 No. 232. Typhoid fever, September 13; sick in hospital September 30.
 No. 233. Malaria, September 13 to 29.

No. 234. Malaria, September 13 to 27.
 No. 235. Malaria, September 13 to 27. This man had diarrhea June 3 to 5.
 No. 236. Malaria, September 14; sick in hospital September 30.
 No. 237. Malaria, September 14; sick in hospital September 30.
 No. 238. Malaria, September 14 to 29.
 No. 239. Typhoid fever, without date; sent to hospital September 15; furloughed November 3.
 No. 240. Malaria, September 15; sick in hospital September 30.
 No. 241. Malaria, September 16; sick in hospital September 30.
 No. 242. Malaria, September 16; sick in hospital September 30.
 No. 243. Malaria, without date; sent to hospital September 16; furloughed October 8.
 No. 244. Malaria, September 16 to October 5.
 No. 245. Malaria, without date; sent to hospital September 17; returned to sick quarters October 10.
 No. 246. Malaria, September 17 to 30. This man had diarrhea June 7 and 8.
 No. 247. Malaria, September 18 to 30.
 No. 248. Malaria, without date; sent to hospital September 18; sick in quarters October 8.
 No. 249. Typhoid fever, September 19 to October 24.
 No. 250. Typhoid fever, September 21; sent to division hospital September 30; further disposition not given.
 No. 251. Typhoid fever, September 23; disposition not given.
 No. 252. Malaria, without date; sent to hospital September 23; still sick October 31.
 No. 253. Typhoid fever, September 23; sent to division hospital September 30; further disposition is not given.
 No. 254. Malaria, September 25 to October 24.
 No. 255. Typhoid fever, September 25; in division hospital September 30.
 No. 256. Malaria, without date; sent to hospital September 30; furloughed October 18.
 No. 257. Typhoid fever, without date; sent to hospital October 14; still sick October 31.
 No. 258. Typhoid fever, October 14; still sick October 31. This man had intermittent malaria September 9 to 12; diarrhea June 14 to 23.
 No. 259. Malaria, without date; sent to hospital October 14; furloughed November 4.
 No. 260. Typhoid fever October 19; in hospital October 31.
 No. 261. Malaria, without date; sent to hospital October 20; transferred to Fort Thomas November 5.
 No. 262. Malaria, without date; sent to hospital October 22; furloughed November 2.
 No. 263. Typhoid fever, November 2; furloughed November 16.
 No. 264. Typhoid fever, without date; sent to Fort Thomas November 2; returned to duty December 3.
 No. 265. Typhoid fever, without date; sent to Fort Thomas November 5; returned to duty December 3.
 No. 266. Typhoid fever, without date; sent to Fort Thomas November 5; returned to duty November 25.
 No. 267. Malaria, without date; sent to Fort Thomas November 7; returned to duty December 7.
 No. 268. Typhoid fever, without date; sent to hospital November 7; furloughed November 8.

SUMMARY.

Assembled at Jefferson Barracks May 5, 1898.
 Mustered into United States service about May 10, 1898.
 Arrived at Chickamauga Park May 20, 1898.
 Strength on arrival, 1,040.
 Date of first case of probable typhoid fever, May 26, 1898.
 Date of first case of recognized typhoid fever, May 27, 1898.
 Left Chickamauga Park August 27, 1898.
 Strength on departure, 1,269.

Number of cases of probable typhoid fever developed at Chickamauga	149
Arrived at Lexington, Ky., August 29, 1898.	
Number of cases of probable typhoid fever developed after leaving Chickamauga Park:	
From August 28 to 31	12
During September	94
During October	7
During November	6
Total number of cases of probable typhoid fever developed in the Second Missouri Volunteer Infantry from May to November	268
These 268 cases were diagnosed as follows:	
Typhoid fever	181
Malaria	85
Diarrhea	2
Total	268

The following is a list of the total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
1898.				
Barton, Claud	Pvt., L.	Sept. 4	Chickamauga, Ga.	Typhoid.
Brubaker, Erwin E.	Pvt., G.	Sept. 20	Camp Thomas, Ga.	Do.
Concklin, W. W.	Pvt., B.	Aug. 28do	Do.
Cox, James	Pvt., A.	Aug. 23	Division hospital	Do.
Howerton, John M.	Pvt., D.	Aug. 15	Chickamauga, Ga.	Do.
Hughes, Wm. G.	Art., I.	June 26	Camp Thomas, Ga.	Do.
Jordan, Herbert G.	Pvt., I.	Nov. 18	Camp Churchman	Convulsions.
Kuehl, Fred. W.	Pvt., C.	July 26	Camp Thomas, Ga.	Typhoid.
Leshner, Guy	Pvt., L.	Sept. 15	Camp Hamilton, Ky.	Do.
Orrick, James W.	Corpl., E.	Aug. 6	Camp Thomas, Ga.	Do.
Phelps, Wm.	Pvt., M.	Aug. 10	Division hospital	Do.
Quinton, Charles F.	Pvt., D.	July 28	Chickamauga, Ga.	Do.
Shinn, John R.	Pvt., I.	July 1	Place not given	Do.
Smith, Conley L.	Pvt., B.	Sept. 3	Camp Thomas, Ga.	Do.
Stenger, George C.	Pvt., C.	Aug. 11do	Do.
Stultard, Thos.	Pvt., C.	Aug. 23	Division hospital	Do.
Van Geison, Ora.	Pvt., M.	Aug. 31	Chickamauga, Ga.	Do.
Walker, Wm. G.	Pvt., K.	Aug. 20do	Do.
Wood, Chas. P.	Sgt., A.	July 11do	Do.
Worden, John T.	Pvt., E.	July 17	Camp Thomas, Ga.	Do.

This gives a total of 20 deaths, 19 of which were due to typhoid fever.

Percentage of deaths among probable cases (268) of typhoid fever, 7.09.

Percentage of deaths among recognized cases (181) of typhoid fever, 10.49.

COMMUNICATIONS FROM THE SURGEONS OF THE SECOND MISSOURI VOLUNTEER INFANTRY.

Medical Officers.

Samuel K. Crawford, surgeon, Sedalia, Mo.

Charles H. Stearns, assistant surgeon, Clinton, Mo.

H. H. Rutherford, first lieutenant and assistant surgeon, Columbia, Mo.

Major Crawford states:

This regiment went into its first camp immediately south of Jefferson Barracks, Mo., on a high unwooded ridge, having deep soil and perfect drainage, on May 5, 1898, and remained in this camp until May 18, enjoying general good health, having no serious sickness whatever. The water supply was hauled in tanks from the same pipes that furnish water to St. Louis. Here the sinks were dug deep on a side hill to the south of the camp, 300 and 400 feet away, preventing malodors and bad surface influences from affecting the men. No disinfectants were used in the sinks, which were uncovered and open, until date of vacating camp, May 18. Nearly all the men left this camp in good health, despite bad tentage and bad weather. In this camp the men purchased pies and various prepared foods from peddlers, despite orders to the contrary—probable source of infection. May 18 this regiment took trains for and arrived at Camp George H. Thomas, Chickamauga Park, Geor-

gia, May 20, where it went into its second camp on a rocky hill facing the east. The camp site had enough of forest trees to partially shade the grounds, but not enough to prevent drying after rains. Sanitary sinks here were practically impossible, owing to shallow soil and declivity. This camp did not suffer from the drainage of other camps; their slopes gave it immunity from their surface washings.

The Third Brigade sinks of the Third Division, First Army Corps, were all wholly bad; all were shallow, all open, all unprovided with lime or chemicals, and each contributed malodors and flies almost without limit.

By digging new sinks frequently, we tried to minimize exposures to typhoid infection. In this camp the Second Missouri Infantry contracted much sickness, which, apart from attacks of acute indigestion, consisted chiefly of typhoid fever, in its mild, ambulatory form and on to its worst type, attended with cerebro-spinal complications, ulcerations, and perforations of bowels, hemorrhages, and death. The water supply was obtained from the Blue Spring, 4 miles from camp, and was hauled in barrels to many regiments in the park besides the Second Missouri. At first, mule teams were driven into the margin of the spring, and here the barrels were filled and covered with blankets and bits of canvas, which had been thrown on the ground, and thus dirt and infection were freely imparted to the water; besides, in the transfer of this water from the wagons to the company barrels, the men's hands were freely washed in the Blue Spring water. The men drank out of cups in common, dipping them into water barrels in common, and thus the diseased men readily and surely communicated typhoid germs to the uninfected. This method of water supply continued, but under improved conditions during the entire encampment of this regiment in Chickamauga Park, that is, from May 20 until August 27, 1898. Improved methods consisted in keeping mules out of the spring, keeping barrels clean and scalded, forcing the use of individual drinking cups, boiling the drinking water, covering the water barrels and putting faucets in them. From May 20 to August 6 this camp was occupied by the Second Missouri Infantry. No troops had occupied this site since September, 1863, and then only as a battle ground.

On August 6 this regiment was ordered to a new camp, a mile and a half away, which had been the site of other commands a few weeks before. This camp was on better ground, had deep soil, good drainage, was an open field, was easily policed, and of itself apparently sanitary. The Chickamauga Creek ran along the base of this camp, distant half a mile, and all the intervening bottom was heavily wooded, and this low ground received the overflow of many sinks, after heavy rains, from typhoid-fever camps above its level. The prevailing winds blew from this direction and spoiled the air of this, our second Chickamauga camp. The low ground at the base of this camp gave us bad sinks, as they filled up with earth water and by overflow from rains. Here we remained from August 6 until August 27, showing an increase of typhoid fever, especially in an aggravated form, which caused us to furlough nearly 80 of our typhoid convalescents from this and our former camp. While here we purchased, with private funds, lime for the sinks, and thus rendered them relatively less contaminating and offensive.

On the above date we proceeded by rail to our next camp at Lexington, Ky., situated 4 miles east of the city, upon an ideal blue-grass pasture, whose surface was free from timber, was clean and untrodden by the feet of soldiers, having no infection excepting that we brought. Here our sick list decreased, and the cases of typhoid fever that developed became less severe, until the morning sick call failed to bring forth a real Chickamauga tongue, so characteristic of that camp. The supply of water at Lexington was piped from the source of the city supply into barrels at each company kitchen, where it was boiled, placed in barrels with faucets attached, and individual cups were used for drinking. All water barrels were raised on platforms and the utmost care was

taken in police duty. The kitchen sinks were dug deep, covered, and all solid parts of kitchen refuse screened and removed from camp, leaving only the fluids to be held in them.

The sinks and latrines were dug not less than 8 feet deep, covered with neat sheds, supplied with covered seats, and banked outside, thus making the vaults dark as opposed to the breeding of flies and consequent spread of infection. At night, lights were placed in these buildings. Common lime, lime chloride, mercury bichloride, and ferric sulphate were freely used in these vaults, also about the walls and seats, and thus with improved sanitation and change of camp sites typhoid fever was practically stamped out from the Second Missouri Infantry. We added to the above daily routine the exclusion of peddlers' pies and their other food abominations, practiced thorough general policing, and confined the men as near as possible to the Government rations (which are the best on earth), and the men ceased to be victims of typhoid fever and soon became athletes in strength and in action.

In both Chickamauga camps the kitchen refuse was kept in open pits and was covered daily with earth and wood ashes. On November 8 this regiment was removed by rail to Albany, Ga., 700 miles south of Lexington, Ky., and went into Camp Churchman, 1½ miles west of the city. Here sand lies over a red clay, and under these a rotten limestone, containing sea shells and sharks' teeth. All springs in this vicinity are heavily impregnated with lime and are unfit for use in the preparation of food. The water supply was obtained from the city reservoir, which is furnished from an artesian well 800 feet deep. This water was exceptionally pure and cool and was delivered to the regiment through pipes along the line of company kitchens, and to the regimental hospital. In this camp the men's sinks were unusually well constructed, with deep vaults, nice sheds, darkened by banking, seats covered, the entire building kept sanitary through the use of means already mentioned in connection with the camp at Lexington, Ky.

From the time the regiment left the camp at Chickamauga, Ga., the number of cases of typhoid fever diminished and the type grew milder daily. The Chickamauga tongue was never fully reproduced in the Second Missouri Infantry while at Lexington, Ky., and was never seen at sick call or in hospital during the time the regiment remained in its last camp near Albany, Ga. In the brief history of the camp life of this regiment several propositions connected with the propagation and prevention of typhoid fever are clearly demonstrated:

First. That defective sanitation with regard to camp site, camp surroundings, impure water supply, badly prepared food, open and otherwise defective sinks, permitting swarms of flies to deposit germs on protruding and inflamed rectums, defective care of garbage, too long occupation of the same campsite, absence of bathing facilities, access to peddlers' pies, promiscuous use of drinking cups in common, failure to isolate promptly typhoid patients from nontyphoid patients, failure to separate mild typhoid cases from severe typhoid cases, all of which lead to the propagation and rapid spread of this camp disease.

Second. The observance of rules directly and absolutely opposed to the foregoing defects were adopted and rigidly enforced with the result of a steady and rapid reduction of typhoid-fever cases until in the last camp, from November 8, 1898, till March 3, 1899, two or perhaps three cases of typhoid fever would cover the entire number occurring in the camp of the Second Missouri Infantry.

You observed that fewer typhoid cases are reported from the Second Missouri Infantry than are reported from many other commands. If this be so, vigilance over the water supply, care in the preparation of food, treating the sinks to coverings of earth before we had lime, prompt separation of the sick from the well, were prime factors in prevention.

Slight discrepancies between the monthly regimental reports of sick and wounded and those of the division hospitals may appear on account of changes in diagnosis, one surgeon diagnosing certain

cases as malarial remittent fever, while another surgeon regarded them as typhoid cases.

In absence of microscopic tests it was not possible by symptoms and physical signs alone to settle with exactness disputed cases. But with regard to the changes of camps, improved sanitation, the use of pure water, and the separation of typhoid from nontyphoid cases, including the isolation of all the sick from the well, afforded beneficial results that I am assured from personal observation very nearly stamped out typhoid fever from the Second Missouri Infantry.

It is gratifying to notice the decrease in the number of typhoid cases from the breaking up of the first and second camps at Chickamauga until the muster out of this regiment on March 3, 1899, at Albany, Ga., and to those familiar with the physical expressions of patients suffering from the prevailing violent type of this disease, as it developed at Chickamauga, compared with the gradual decline and disappearance of high temperature, red and darkly coated tongues, tender, tympanic bowels, fewer actions of the latter and more comfort between them, fewer hemorrhagic cases, less thirst, more appetite, better rest, better and shorter convalescence, fewer sequelae, suggesting diminished virulence and activity of bacterial agencies, furnishing a parallel of declination on the one hand and on the other increased resistance, due to better sanitation, change of camp site, clean air, and pure water. In absence of strict sanitation, dirt is the greatest possible menace to an army in camp, and the experience gathered at Chickamauga should warn those persons in plenary authority to limit army camps to such numbers as may enable the commands to acquire the necessary evolutions for actual service.

FIRST NEW HAMPSHIRE VOLUNTEER INFANTRY.

Third Brigade, Third Division, First Army Corps.

This regiment was mustered into service May 12, 1898. It reached Chickamauga Park, Ga., May 22.

The first report covers the period from May 12 to May 31, inclusive. In this report Major Burrus makes the following statement:

The prevailing disease has been acute diarrhea, probably caused by drinking surface water. For the first ten days no other water could be obtained. The men had no shovels, and would dig in the runs with sticks for the filthy surface water. We have almost no medical supplies, except those we have bought ourselves in Chattanooga and paid for ourselves. Owing to this, in many cases it has not been possible to properly treat our sick men.

CONDENSED SICK REPORT FROM MAY 12 TO MAY 31, INCLUSIVE.

Mean strength	1,007
Diarrhea	35
Dysentery	49
Acute fever	4
Dyspepsia	5
Enteritis	1
Other diseases	54
Total	148

Two of the diarrheal cases reported in May were so prolonged as to lead us to believe that they may have been cases of typhoid fever. The first of these was a private in Company L, who is recorded as having had diarrhea from May 24 to June 18. The second was a private in Company F, who is reported as having had diarrhea from May 30 to June 18. Both of these may

have been mild cases of typhoid fever. If they were typhoid fever, the regiment reached Chickamauga Park infected with this disease.

CONDENSED SICK REPORT FOR JUNE.

Mean strength	989
Diarrhea	331
Malaria	11
Typhoid fever	12
Dysentery	2
Other diseases	16
Total	372

CONDENSED SICK REPORT FOR JULY.

Mean strength	1,164
Diarrhea	282
Malaria	43
Typhoid fever	95
Dysentery	1
Other diseases	47
Total	468

It will be seen from this report that typhoid fever rapidly increased.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength not given.	
Typhoid fever	143
Malarial fever	82
Diarrhea	315
Not diagnosed	16
Other diseases	27
Total	583

This regiment left Chickamauga Park, Ga., August 26, 1898, and proceeded to Lexington, Ky. It remained at the latter place only a few days and then departed for Camp Ramsdell. We infer from the report that the regiment was furloughed on September 12, because there is no entry on the record for the month of September after this date.

The following is a list of the cases of typhoid and probable typhoid fever in this regiment:

- No. 1. Diarrhea, May 24 to June 18.
- No. 2. Diarrhea, May 30 to June 18.
- No. 3. Typhoid fever, June 4; furloughed August 16.
- No. 4. Diarrhea, June 4 to 19.
- No. 5. Diarrhea, June 4 to 19.
- No. 6. Diarrhea, June 4 to 17.
- No. 7. Malaria, June 8 to 23.
- No. 8. Malaria, June 16; still sick September 30.
- No. 9. Typhoid fever, June 18; disposition not given.
- No. 10. Malaria, June 18 to 29.
- No. 11. Typhoid fever, June 20; sent to division hospital June 23, and without further record.
- No. 12. Typhoid fever, June 23 to August 17.
- No. 13. Typhoid fever, June 26 to July 27.
- No. 14. Typhoid fever, June 29; sent to division hospital July 19, and without further record.
- No. 15. Typhoid fever, June 29 to July 16.
- No. 16. Typhoid fever, June 29 to July 24.

- No. 17. Typhoid fever, July 1; disposition not given.
- No. 18. Typhoid fever, July 1; died July 13.
- No. 19. Malaria, July 1 to 16.
- No. 20. Malaria, July 2 to 25.
- No. 21. Typhoid fever, July 2; sent to division hospital July 10. There is no further record of this case.
- No. 22. Typhoid fever, July 3; sent to division hospital July 8, and without further record.
- No. 23. Typhoid fever, July 5; disposition not given.
- No. 24. Malaria, July 7 to 26.
- No. 25. Diarrhea, July 7 to 20.
- No. 26. Malaria, July 8 to August 8.
- No. 27. Typhoid fever, July 8; furloughed July 23.
- No. 28. Typhoid fever, July 8; disposition not given.
- No. 29. Typhoid fever, July 9; disposition not given.
- No. 30. Typhoid fever, July 11; furloughed August 13.
- No. 31. Typhoid fever, July 12; sent to division hospital July 17, and without further record.
- No. 32. Malaria, July 13; sent to division hospital July 31. Here the diagnosis was changed to typhoid fever, and the patient was furloughed August 27.
- No. 33. Diarrhea, July 14 to 30.
- No. 34. Typhoid fever, July 14; sent to division hospital July 20, and without further record.
- No. 35. Diarrhea, July 15; furloughed July 17.
- No. 36. Malaria, July 15; furloughed July 29.
- No. 37. Malaria, July 16; furloughed August 20.
- No. 38. Malaria, July 16; still sick August 31.
- No. 39. Typhoid fever, July 16 to August 17.
- No. 40. Typhoid fever, July 17; furloughed August 30.
- No. 41. Typhoid fever, July 18; sent to division hospital July 31, and without further record.
- No. 42. Malaria, July 18 to August 17.
- No. 43. Diarrhea, July 18; still sick August 31.
- No. 44. Gastritis, July 19; still sick August 31.
- No. 45. Typhoid fever, July 19 to August 19.
- No. 46. Typhoid fever, July 19; no disposition given.
- No. 47. Typhoid fever, July 19; sent to division hospital July 21, and without further disposition.
- No. 48. Typhoid fever, July 19 to August 28.
- No. 49. Without diagnosis or date; sent to division hospital July 19. Here diagnosed as typhoid fever, and furloughed August 24.
- No. 50. Typhoid fever, July 21; sent to division hospital July 21, and without further disposition.
- No. 51. Malaria, July 21; still sick August 31.
- No. 52. Typhoid fever, July 21; sent to division hospital July 26, and without further record.
- No. 53. Typhoid fever, July 23 to August 17.
- No. 54. Typhoid fever, July 23; sent to division hospital July 26, and without further record.
- No. 55. Typhoid fever, July 23; furloughed August 12.
- No. 56. Typhoid fever, July 23; furloughed September 1.
- No. 57. Typhoid fever, July 23 to August 17.
- No. 58. Typhoid fever, July 23; sent to division hospital July 26, and without further record.
- No. 59. Typhoid fever, July 23; sent to division hospital July 23, and without further record.
- No. 60. Malaria, July 24; furloughed August 21.
- No. 61. Typhoid fever, July 25; sent to division hospital August 2, and without further record.
- No. 62. Typhoid fever, July 25; furloughed August 11. This man is recorded as having been returned to duty August 11; but, as we have stated elsewhere, it was customary in many regiments, when men were furloughed, to record them as returned to duty or to furlough duty.
- No. 63. Diarrhea, July 25; still sick August 31.
- No. 64. Typhoid fever, July 26; furloughed August 9.
- No. 65. Typhoid fever, July 26; furloughed August 30.

- No. 66. Typhoid fever, July 26; furloughed August 29.
 No. 67. Diarrhea, July 26; still sick August 31.
 No. 68. Typhoid fever, July 26; sent to division hospital August 1, and without further record.
 No. 69. Malaria, July 26; still sick August 31.
 No. 70. Typhoid fever, July 26 to August 31.
 No. 71. Typhoid fever, July 26; furloughed August 20.
 No. 72. Typhoid fever, July 26 to August 22.
 No. 73. Typhoid fever, July 26 to August 24.
 No. 74. Typhoid fever, July 26; sent to division hospital August 1, and without further record.
 No. 75. Typhoid fever, July 26 to August 20.
 No. 76. Typhoid fever, July 26 to August 20.
 No. 77. Typhoid fever, July 27; sick August 31.
 No. 78. Typhoid fever, July 27 to August 19.
 No. 79. Typhoid fever, July 27; sent to division hospital August 1, and without further record.
 No. 80. Malaria, July 27; still sick August 31.
 No. 81. Typhoid fever, July 28; disposition not given.
 No. 82. Typhoid fever, July 28; sent to division hospital August 2, and without further record.
 No. 83. Typhoid fever, July 28; sent to division hospital August 1, and without further record.
 No. 84. Typhoid fever, July 28; furloughed August 10.
 No. 85. Malaria, July 28; furloughed August 9.
 No. 86. Typhoid fever, July 28; furloughed August 7.
 No. 87. Typhoid fever, July 28; furloughed August 19.
 No. 88. Malaria, July 28; still sick August 31.
 No. 89. Typhoid fever, July 28; still sick August 31.
 No. 90. Typhoid fever, July 28; furloughed August 17.
 No. 91. Typhoid fever, July 29; furloughed August 15.
 No. 92. Typhoid fever, July 29; furloughed August 22.
 No. 93. Typhoid fever, July 29 to August 20.
 No. 94. Typhoid fever, July 29; sent to division hospital August 4, and without further record.
 No. 95. Typhoid fever, July 29; furloughed August 17.
 No. 96. Typhoid fever, July 29; sent to division hospital August 2, and without further record.
 No. 97. Typhoid fever, July 30; sent to division hospital August 21, and without further record.
 No. 98. Typhoid fever, July 30; furloughed August 27.
 No. 99. Typhoid fever, July 30; furloughed September 1.
 No. 100. Malaria, July 31; furloughed August 14.
 No. 101. Typhoid fever, July 31; furloughed August 14.
 No. 102. Typhoid fever, July 31; furloughed September 1.
 No. 103. Typhoid fever, July 31; furloughed September 21.
 No. 104. Typhoid fever, July 31; sent to division hospital August 5, and without further record.
 No. 105. Typhoid fever, July 31; furloughed August 19.
 No. 106. Malaria, July 31; furloughed August 14.
 No. 107. Malaria, August 1; furloughed August 12.
 No. 108. Malaria, August 1; furloughed August 14.
 No. 109. Typhoid fever, August 1; furloughed August 24.
 No. 110. Typhoid fever, August 1; furloughed August 24.
 No. 111. Diarrhea, August 1; still sick August 31.

SUMMARY.

Assembled at Camp Ramsdell, N. H., in April, 1898.

Mustered into United States service May 12, 1898.

Arrived at Chickamauga Park, May 22, 1898.

Strength on arrival, 1,007.

Date of first case of probable typhoid fever, May 24, 1898.

Date of first case of recognized typhoid fever, June 4, 1898.

Left Chickamauga Park, August 26, 1898.

Strength on departure, 1,296.

Number of cases of probable typhoid fever developed at Chickamauga Park 261

Number of cases of probable typhoid fever developed after leaving Chickamauga Park 36

Total number of cases of probable typhoid fever developed in the First New Hampshire Volunteer Infantry from May to September 12, 1898..... 297

These 297 cases were diagnosed as follows:

Typhoid fever..... 213

Malaria..... 59

Diarrhea..... 24

Gastritis..... 1

Total..... 297

The following is a list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
1898				
Aldrich, Darwin W....	Sgt., L.	July 31	Camp Thomas, Ga....	Typhoid.
Angier, John C.....	Pvt., L.	Sept. 7do.....	Do.
Banfill, William W....	Pvt., E.	Aug. 21do.....	Do.
Bergeron, Joseph.....	Pvt., H.	Aug. 25	Chickamauga Park, Ga.	Enteric fever.
Boudreau, Oliver.....	Pvt., F.	Sept. 9	Manchester, N. H....	Typhoid.
Bradbury, William R..	Pvt., A.	Oct. 8	Concord, N. H....	Do.
Clement, Russ.....	Pvt., M.	Aug. 8	Camp Thomas, Ga....	Do.
Connors, William J....	Pvt., I.	Sept. 15	Manchester, N. H....	Do.
Dervin, William H....	Sgt., B.	Aug. 12	Camp Thomas, Ga....	Pneumonia.
Filgate, William L....	Pvt., K.	Oct. 9	The Weirs, N. H....	Typhoid.
Gaffney, Edward H....	Pvt., I.	Aug. 17	Camp Thomas, Ga....	Do.
Gilman, Nelson E.....	Corpl., K.	Aug. 24do.....	Do.
Hallisey, John J.....	Pvt., I.	Aug. 4	Fort Thomas, Ky....	Do.
Johnson, Roland A....	Pvt., I.	July 13do.....	Do.
Keefe, Frederick A....	Pvt., C.	Sept. 6	Manchester, N. H....	Do.
King, Thomas E.....	Pvt., C.	Aug. 24	Camp Thomas, Ga....	Fever.
Malouson, Henry.....	Pvt., C.	Sept. 27	Concord, N. H....	Typhoid.
Morrill, Alfred J.....	Corpl., K.	Aug. 12	Camp Thomas, Ga....	Do.
Peters, Levi W.....	Pvt., I.	Sept. 16	Concord, N. H....	Do.
Rafter, John.....	Pvt., M.	Sept. 6	Grafton, W. Va.....	Do.
Reed, Harold S.....	Pvt., E.	Nov. 18	Concord, N. H....	Septicæmia.
Roberts, Cassius B....	Corpl., F.	Aug. 3	Camp Thomas, Ga....	Typhoid.
Rossiter, William A....	Mus., F.	Aug. 24do.....	Fever and hemorrhages.
Sanborn, William A....	Capt., K.do....	Chickamauga Park, Ga.	Typhoid.
Scruton, Frank M....	Pvt., M.	Oct. 3	Farmington, N. H....	Do.
Silver, Julius M.....	Pvt., D.	Aug. 19	Camp Thomas, Ga....	Fever.
Simonds, Robert.....	Pvt., H.	Sept. 3	Franklin, N. H....	Typhoid.
Stoddard, Leslie R....	Pvt., L.	Oct. 3	Chesterfield, N. H....	Do.
Stowell, Ira.....	Capt., M.	Aug. 31	Chattanooga, Tenn..	Do.
Sullivan, Charles J....	Pvt., K.	Oct. 6	Manchester, N. H....	Do.
Swain, William G.....	Pvt., G.	Aug. 18	No place given.....	Do.
Weatherwax, O. J.....	Pvt., M.	Aug. 23	Chickamauga Park, Ga.	Do.

This gives a total of 32 deaths, 30 of which were due to typhoid fever.

Percentage of deaths among probable cases (297), 10.10.

Percentage of deaths among recognized cases (213) of typhoid fever, 14.08.

COMMUNICATIONS FROM THE SURGEONS OF THE FIRST
NEW HAMPSHIRE VOLUNTEER INFANTRY.

Medical officers.

James T. Greeley, major and surgeon, Nashua, N. H.
Charles E. Congden, lieutenant and assistant surgeon, Berlin, N. H.
Russell Wilkins, lieutenant and assistant surgeon, Concord, N. H.

Major Greeley states:

With the exception of the first few days, the rations, both as regards quality and quantity, were all that could be desired.

The entire regimental camp was inspected each day by the colonel and surgeon, when all kitchens and all sinks were looked into. Each Sunday this inspection was more formal and more extended, including the inspection of the company streets, the tents, inside and out, all ordnance, shelter-tent rolls, the hospital and its contents, including patients, medicines and supplies. The officer of the day and the company officers also made daily inspections. Moreover, each day the regiment was visited and inspected by a medical officer from the division, and also by the brigade surgeon. Then the division inspector of the week visited and inspected the camp each day.

In regard to the policing of the camp, I can only say that the camp was kept in a scrupulously neat condition, notwithstanding the fact that our camp site was one of the worst in Chickamauga Park, being over a ledge and very rocky. The sinks were kept covered and ditched, pieces of paper, kitchen refuse, and debris of all kinds were removed and burned or buried at once, so that the neatness of the camp was proverbial. During the rains the water ran into and collected in the sinks, owing to the clayey nature of the soil, to such an extent as to occasionally deposit the contents on the adjoining ground.

The instructions given in regard to the sinks were, in a general way, that they should be located at the foot of the company streets, a certain number of feet from the company kitchens; that they should be dug at least 8 feet deep; that they should be kept covered with fine earth as fast as used; that when within 18 inches of the surface of the ground they should be finally covered and marked, and that they should be well ditched. The nature of the soil rendered the digging of an 8-foot sink, except in rare instances, an impossibility. The care and use of the sinks were, however, commendable, and the instructions given followed as well as the natural conditions of the ground would permit. The instructions given in regard to drinking water were simply that no unboiled water should at any time or under any circumstances be drunk. This was, however, nearly impossible to carry out until the regiment was able to obtain, through the quartermaster's department, a considerable increase in the number of barrels and boilers originally issued. This increase was not obtained for many weeks, and in the meantime much polluted, unboiled water was undoubtedly consumed.

The line officers, with the exception of the ordinary details, were continually with their companies. The field was somewhat reduced in strength through severe sickness of the two senior majors. The staff was fairly represented with the exception of the chaplain, who resigned in June, and the surgeon and one assistant surgeon, who were detailed, the first to the division hospital, and the other to the ambulance company early in the summer.

All sick, except those merely indisposed, were sent to the division hospital by the ambulance, which called at the regiment each morning. In other words, the regimental hospital was reduced to a dispensary. This method answered all requirements until the epidemic of typhoid fever became marked, then our small regimental hospital overflowed, notwithstanding our efforts to enlarge it to meet the increasing demand. The maximum number of beds in our regimental hospital was 56. These, together with most of the medicines used, including milk, malted milk, ice, etc., were supplied by the New Hampshire State Aid Society fund, the divi-

sion hospital being unable to honor my requisitions except in rare instances.

Our regiment remained in one camp nearly all the time while at Chickamauga Park, changing only to more open ground a short time before being ordered to Lexington, Ky. One week was spent at Lexington before the regiment was ordered home, furloughed, and mustered out of the United States service.

NINTH PENNSYLVANIA VOLUNTEER INFANTRY.

Third Brigade, Third Division, First Army Corps.

The first report is signed by Maj. W. S. Stewart.

CONDENSED SICK REPORT FROM MAY 10 TO 31.

Mean strength	640
Intermittent fever	3
Acute diarrhea	19
Enterocolitis	3
Acute gastritis	2
Other diseases	7
Total	34
Admissions from command	24
Disposition:	
Returned to duty	13
Remaining on sick report—	
Hospital	9
Quarters	2
Total	24

The June report is signed by W. G. Weaver, surgeon in charge, who makes the following remarks:

Typhoid fever has been prevalent. The cause has not been ascertained. Orders have been issued compelling the boiling of all drinking water and the filling up of all surface holes and the immediate policing of the sinks after their use. Flies may have carried the germs from the excreta to the mess tents.

CONDENSED SICK REPORT FOR JUNE.

Mean strength	1,044
Typhoid fever	12
Intermittent fever	8
Fever	1
Hepatitis	1
Acute diarrhea	47
Enterocolitis	10
Acute gastritis	1
Chronic diarrhea	1
Gastro-enteritis	1
Debility following diarrhea	1
Other diseases	45
Total	128
Admissions:	
Remaining from last month	7
From command	141
Total	148
Disposition:	
Returned to duty	124
Remaining on sick report—	
Hospital	14
Quarters	10
Total to be accounted for	148

The July report is signed by Major Stewart without comment.

CONDENSED SICK REPORT FOR JULY.

Mean strength	1,204
Typhoid fever.....	31
Intermittent malaria.....	82
Intermittent fever.....	24
Acute diarrhea.....	159

Discharged for disability.....	2
Total	303
Remaining on sick report:	
Hospital.....	26
Quarters.....	93
Total	119

It will be seen that the above-given figures show discrepancies. However, we have not felt authorized to make any changes in them.

The August report is signed by Major Stewart without remarks.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength	1,301
Typhoid fever.....	98
Intermittent malaria.....	192
Intermittent fever.....	5
Hepatitis.....	1
Remittent malaria.....	2
Acute diarrhea.....	157
Total	455
Admissions:	
Remaining from last month.....	37
From command.....	258
Total to be accounted for.....	295
Completed cases:	
Returned to duty.....	285
Died.....	9
Discharged for disability.....	1
Total	295

Remaining on sick report:

Hospital.....	19
Quarters.....	59
Total	78

The September report is signed by Maj. W. S. Stewart, per Claude R. Grosser, assistant surgeon. This report contains no comments.

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength.....	1,270
Typhoid fever.....	93
Intermittent malaria.....	98
Intermittent fever.....	5
Hepatitis.....	1
Acute diarrhea.....	77
Indigestion.....	7
Other diseases.....	44
Total	325

We have gone over the sick reports for this regiment and have made a list of cases of probable typhoid fever, but want of space will not permit us to insert it. The most essential points will be brought out in the summary.

SUMMARY.

Assembled at Mount Gretna, Pa., in April, 1898.	
Mustered into United States service May 10, 1898.	
Arrived at Chickamauga Park, May 20, 1898.	
Strength on arrival, 640.	
Date of first case of probable typhoid fever, May 31, 1898.	
Date of first case of recognized typhoid fever, June 14, 1898.	
Left Chickamauga Park, August 26, 1898.	
Strength on departure, 1,291.	
Number of cases of probable typhoid fever developed at Chickamauga Park.....	287
Number of cases of probable typhoid fever developed after leaving Chickamauga Park from August 27 to September 13.....	47
Total number of cases of probable typhoid fever developed in the Ninth Pennsylvania Volunteer Infantry from May to September 13, 1898.....	334
These 334 cases were diagnosed as follows:	
Typhoid fever.....	155
Malaria.....	128
Diarrhea.....	51
Total	334
These cases were distributed through the companies as follows:	
Staff and band.....	3
Company A.....	28
Company B.....	18
Company C.....	38
Company D.....	26
Company E.....	25
Company F.....	25
Company G.....	35
Company H.....	19
Company I.....	18
Company K.....	36
Company L.....	30
Company M.....	33
Total.....	334

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
1898.				
Armbruster, V. J.	Pvt., L.	Aug. 12	Chickamauga, Ga.	Typhoid.
Bell, Oliver H.	Capt., D.	Sept. 9	Camp Thomas, Ga.	Do.
Chilsom, Glenn B.	Pvt., M.	Aug. 31	do	Do.
Cohen, Barney	Pvt., E.	July 22	No place given	Do.
Deegan, Leonard	Pvt., D.	Aug. 9	Camp Thomas, Ga.	Do.
Deitrick, Henry A.	Pvt., B.	Sept. 9	Wilkesbarre, Pa.	Do.
Detweiler, Frank	Pvt., G.	Aug. 10	Camp Thomas, Ga.	Do.
Fry, Frank D.	Pvt., A.	Aug. 22	do	Do.
Gilmartin, Wm.	Pvt., H.	July 2	Chickamauga, Ga.	Do.
Holsey, John J.	Pvt., C.	Aug. 1	Camp Thomas, Ga.	Do.
Jackson, Carver W.	Pvt., B.	Sept. 18	Harveys Lake, Pa.	Do.
Jenkins, Jonah A.	Pvt., F.	Aug. 10	Camp Thomas, Ga.	Do.
Klutz, Robert	Pvt., K.	Sept. 2	Chickamauga, Ga.	Continued malaria.
Mahoney, James	Pvt., M.	Oct. 23	Towanda, Pa.	Congestion of brain.
Miers, Darias L.	Capt., E.	Aug. 27	Wilkesbarre, Pa.	Typhoid.
Moore, Charles F.	Pvt., M.	Aug. 31	Chickamauga, Ga.	Do.
Pointon, Wm.	Pvt., C.	Aug. 1	Camp Thomas, Ga.	Do.
Powell, John L.	Pvt., C.	Oct. 22	Pittston, Pa.	Do.
Rhodes, George	Pvt., E.	Sept. 3	Wilkesbarre, Pa.	Do.
Savage, Benj. F.	Sgt., F.	July 30	Chickamauga, Ga.	Do.
Schmidt, J. A.	Pvt., F.	July 27	do	Do.
Shaffer, Frank	Pvt., K.	Sept. 6	Camp Hamilton, Ky.	Do.
Stearns, Demson	Capt., B.	do	Wilkesbarre, Pa.	Do.
Terry, Draper T.	Cpl., M.	Sept. 25	No place given	Do.
Thomas, John R.	Pvt., A.	July 18	do	Do.
Thomas, Wm. F.	Pvt., A.	July 11	Camp Thomas, Ga.	Do.
Trainer, Michael	Pvt., F.	Sept. 27	Wilkesbarre, Pa.	Appendicitis.

This gives a total of 27 deaths, 25 of which were due to typhoid fever, which is equivalent to 7.48 per cent of our probable cases.

Percentage of deaths among recognized cases (155) of typhoid fever, 16.12.

COMMUNICATIONS FROM THE SURGEONS OF THE NINTH PENNSYLVANIA VOLUNTEER INFANTRY.

Medical officers.

Walter S. Stewart, major and surgeon, Wilkesbarre, Pa.

Charles H. Muier, lieutenant and assistant surgeon, Wilkesbarre, Pa.

Claude R. Grosser, lieutenant and assistant surgeon, Wilkesbarre, Pa.

Major Stewart states:

Our camp at Chickamauga lay facing the Vinyard and Alexander road about 500 yards from the site of Alexander House. Here, on this limited amount of ground, our camp was laid out. The ground covered by a growth of young timber sloped down from a low ridge to the roadway, which was from 2 to 6 feet or more higher than the camp ground adjoining, and thus well fitted to act as a dam breast, and retain any water which might flood down over camp. Beyond this road, at a distance of some 800 feet, the Chickamauga Creek winds in and out among the trees that fringe the banks. Between this creek and our camp lay an open field used as a drill ground and dry enough in dry weather, but practically a marsh after some of the hard rains we experienced. The soil upon which our camp lay is exceedingly hard and rocky, and it was possible to dig the sinks for mess refuse and the latrines to a depth of only about 2 or 3 feet, thus necessitating the frequent digging of new ones, and quickly filling in all of our available space. By positive orders of General Bates we were obliged to place all our sinks on the side of the road next to the camp. Hence the elevated road instead of being an aid to us was an actual source of danger. We had at the most but 75 feet between our cook fires and the road, in some instances not that much space. Consider for a moment this proximity of the sinks and the kitchens, the hard nature of the soil, which allowed practically no absorption of the rains, and the road, at the foot of the camp, which blocked back the rain water over the sinks up toward our kitchens, and you can readily imagine what we had thrust upon us after a short occupation of these grounds.

We had a perfect pest hole at our very doors, and despite the most careful and thorough use of lime and other disinfectants, we could do nothing to obviate the danger staring us in the face. I might add it was with the greatest difficulty that we succeeded in getting disinfectants.

About June 29 a request was made for permission to move the sinks across the road, and finally, on July 11, we received from brigade headquarters authority to do so. However, before the work had progressed very far, General Sanger, commanding officer of the division, came up and ordered the men to cease work and keep the sinks in their old location. The commanding officer of the regiment then went to the chief surgeon of the division, and, finally, with the aid of the medical staff got permission on July 24, to move the sinks beyond the road.

The close proximity of the sinks was, in my opinion, one of the causes of so much fever in the Ninth Regiment. When we first moved into camp our water supply was taken from wherever we could get it—from the creek, from the surface springs, etc.—but after a few days barrels were supplied, and then it was hauled from Blue Spring, 5 miles away, and was apparently good and pure water. They also hauled water from artesian wells which were sunk in different parts of the park, one close to our regiment. I always thought that they were a source of contagion; afterwards they were ordered closed.

On June 29 General Brooke issued an order requiring us to use the water brought through pipes from a pumping station on Chickamauga Creek, above the camping grounds. This order stated that, after analysis of all the water supplies, that of the creek was found to be the best, and hence it was to be boiled and used for drinking purposes.

On the 11th of July this water was condemned and the men were forbidden to bathe in the creek on account of the danger of contagion. I inclose you the orders. You will also find inclosed the order issued for the routine daily work in our division which practically speaks for itself, giving the men only about seven and one-half hours' sleep or rest in the twenty-four hours. In that hot climate, for northern men the work was entirely too arduous.

It was a recognized fact, not only with the officers of the regiment but with the men, that their only salvation was to have this camp moved to another part of the park, and with this in view the colonel commanding set to work, but not until August 4 did he get permission to change his camp to the Smith White field and a fine open piece of ground with plenty of room and a more porous soil. This camp was beautifully laid out. The sinks for the men were placed 150 yards from the tents with well-built closets, the money for which was supplied from private funds. The kitchen sinks were placed within 10 yards of the kitchens and were constructed as follows: Sink holes were dug 16 feet long, 4 feet wide, and 8 feet deep. Across the top cord wood was placed with an opening 2 feet square in the center; over this was placed a box shaft 2 feet square and 3 feet high with hinged lid on top. All the earth taken from the sink holes was then filled, mound shaped around the square box shaft, making concealed sink holes. One such sink was provided for each company and owing to their size they were ample to last a month before being filled. On August 25 the regiment was ordered to Lexington, where we had a beautiful camp about 7 miles from the city. This camp was modeled after the one on the Smith White field. The water was piped from the city reservoir, of good quality, and plenty of it. Very few cases of fever appeared after the first ten days.

I can not correct any of the figures in the sick report, but will make this statement: That many of the cases put down there as malaria and diarrhea were typhoid, and the discrepancy occurred in this way: The man making out the reports took the regimental diagnosis, which was made before the patient was transferred to the division hospital, where it was afterwards diagnosed typhoid. The mistake will be found in the majority of the sick reports and can only be corrected by comparing these reports with the division hospital reports.

While I believe the water was the first cause of contagion, the indiscreet habits of the volunteer soldier was largely the cause of so much fever. One of the strong arguments in favor of the flies as a cause of contagion was that very rarely did you find a case of fever among the staff officers, and that is explained by the fact that they all had their mess tents screened.

General Orders, } HDQRS. 3D DIVISION, FIRST ARMY CORPS,
No. 36. } *Camp George H. Thomas, Ga., July 11, 1898.*

The following hours of service and roll call of the division will take effect to-morrow, July 12.

Reveille, first call, 4.30 a. m.; reveille, 4.40 a. m.; assembly, 4.45 a. m.

Mess, 5 a. m.

Fatigue, 5.30 a. m.

Sick, 5.45 a. m.

Recall from fatigue.

Inspection of company tents, grounds, etc., 6.15 a. m.

Drill, 6.30 a. m.; assembly, 6.40 a. m.

Recall, 8.40 a. m.

Sunday inspection, first call, 7.45 a. m.; assembly, 8 a. m.

Monthly inspection of regiments, first call, 7.45 a. m.; assembly, 8 a. m.

Guard mounting, 9.20 a. m.; assembly, 9.30 a. m.

First sergeants, 11.30 a. m.

Mess, 12 m.

Fatigue, 1 p. m.

School, 1.20 p. m.; assembly, 1.30 p. m.

Recall from fatigue, 2.30 p. m.

Drill, 3.20 p. m.; assembly, 3.30 p. m.

Recall, 5 p. m.

Parade (daily), first call, 6 p. m.; assembly, 6.15 p. m.

Retreat when there is no parade, first call, 6.15 p. m.; assembly, 6.30 p. m.

Tattoo, 8.30 p. m.; assembly, 8.45 p. m.

Taps, 9 p. m.

By command of Brigadier-General Sawyer:

H. L. SCOTT,
Assistant Adjutant-General.

General Orders, } HDQRS. 3D BRIGADE,
No. 129. } THIRD DIVISION, FIRST ARMY CORPS,
} *Camp George H. Thomas, Ga., July 11, 1898.*

In order to promote the general health of the troops in this brigade and to remove a possible source of illness now prevalent, the general commanding directs the commanding officers of the several regiments to forbid bathing in Chickamauga Creek.

By command of Brigadier-General Andrews:

WALTER L. BOUVE,
Assistant Adjutant-General.

HEADQUARTERS THIRD BRIGADE, THIRD DIVISION,
FIRST ARMY CORPS,

Camp George H. Thomas, Ga., June 29, 1898.

Commanding Officers, Ninth Pennsylvania, First New Hampshire, and Second Missouri Volunteers.

SIRs: The brigadier-general commanding the division informs the colonel commanding that General Brooke has had all the water in this vicinity examined, and finds that the water from Chickamauga Creek, which is pumped through the pipe line, is better than that of the Blue Spring or other springs. You are therefore directed to use water from the pipe line, taking care to see that all of it is boiled. While the water from the pipe line has more sediment and is dirtier than that from Blue Spring, still in the process of boiling it will be precipitated. All water must be boiled in accordance with previous directions.

A requisition from this brigade has been made for wash boilers for each company, and an additional barrel for each company, as well as for 500 pounds of chloride of lime as a disinfectant for the sinks. When this supply shall have been received they will be distributed to the regiments.

By command of Colonel Dougherty:

WALTER L. BOUVE,
Assistant Adjutant-General.

GENERAL REMARKS CONCERNING TYPHOID FEVER IN THE THIRD DIVISION OF THE FIRST ARMY CORPS.

All the regiments of this division, excepting the First South Carolina, arrived at Chickamauga Park, Ga., practically at the same time (May 20), all left about the same time (August 23 to 27), and all went to Lexington, Ky. The following table gives figures showing some of the most important facts concerning typhoid fever in the different regiments of this division:

Brigade and regiment.	Date of first case.	Total number of cases.	Number of recognized cases.	Total deaths.	Deaths from typhoid.	Percent of deaths among probable cases.	Percent of deaths among recognized cases.
<i>First Brigade.</i>							
Fifth Pennsylvania.....	May 19	338	152	16	16	4.73	10.52
Twelfth Minnesota.....	May 20	433	144	19	19	4.38	13.12
<i>Second Brigade.</i>							
Eighth Massachusetts.....	May 28	272	157	30	19	7	12.10
Twenty-first Kansas.....	May 21	294	95	23	21	7.14	22.10
Twelfth New York.....	June 6	490	144	21	20	4.08	13.89
<i>Third Brigade.</i>							
Second Missouri.....	May 26	268	181	29	19	7.09	10.49
First New Hampshire.....	May 24	297	213	32	30	10.10	14.08
Ninth Pennsylvania.....	May 31	334	155	27	25	7.48	16.13

Total number of cases of probable typhoid fever in the eight regiments.....	2,726
Total number of cases of recognized typhoid fever in the eight regiments.....	1,241
Total number of deaths in the eight regiments.....	188
Total number of deaths from typhoid fever in the eight regiments.....	169
Percentage of deaths among probable cases of typhoid fever.....	6.19
Percentage of deaths among recognized cases of typhoid fever.....	13.61

The mean strength of these eight regiments from May to September, as nearly as we can ascertain, was 10,329. Figuring on this basis we find the percentage of probable typhoid fever in these eight regiments to be 26.39.

It was quite generally believed among medical officers at Chickamauga that the Second Division of this corps developed typhoid fever much later than the Third Division. As we have already learned, the Second Division obtained its water supply from wells and springs. The Third Division obtained its water supply principally from the pipes that distributed the water of Chickamauga Creek. Many army medical officers believed that the Chickamauga Creek water became contaminated early in July and that regiments supplied with that water developed typhoid fever much more prominently and rapidly than the other regiments did. In order to determine how much of truth there may have been in this general idea we will tabulate the principal figures concerning typhoid fever in both of these divisions. In doing so we will omit the One hundred and sixtieth Indiana from the Second Division

and the First South Carolina from the Third Division. This will make the mean strength of the two divisions practically the same. We omit these two regiments because both of them left Chickamauga much earlier than the other regiments. Onitting these two, all the regiments of the Second and Third Divisions reached Chickamauga within a few days (May 17 to 22) and all left within a few days (August 21 to 29), with the exception of the fact that the First Georgia did not reach Chickamauga until June 17. However, this regiment had been encamped at Griffin, Ga., and we will include the cases of typhoid fever developed in this regiment at that place.

SECOND DIVISION.

Brigade and regiment.	Date of first case.	Number of cases developed at Chickamauga.	Total number of cases.	Total deaths.	Deaths from typhoid.
<i>First Brigade.</i>					
Thirty-first Michigan	June 1	95	239	27	16
First Georgia	June 6	85	120	10	9
<i>Second Brigade.</i>					
One hundred and fifty-eighth Indiana	June 6	95	128	12	10
Sixth Ohio	May 18	70	291	21	19
First West Virginia	June 6	85	260	15	12
<i>Third Brigade.</i>					
First Pennsylvania	May 12	129	222	14	12
Fourteenth Minnesota	May 27	114	286	13	12
Second Ohio	May 20	160	403	14	13
Total		833	1,949	126	103

THIRD DIVISION.

<i>First Brigade.</i>					
Fifth Pennsylvania	May 19	182	338	16	16
Twelfth Minnesota	May 20	320	433	19	19
<i>Second Brigade.</i>					
Eighth Massachusetts	May 28	55	272	30	19
Twenty-first Kansas	May 21	153	294	23	21
Twelfth New York	June 6	197	490	21	20
<i>Third Brigade.</i>					
Second Missouri	May 26	149	268	20	19
First New Hampshire	May 24	261	297	32	30
Ninth Pennsylvania	May 31	287	334	27	25
Total		1,604	2,726	188	169

Total number of cases of probable typhoid fever in eight regiments of the Second Division	1,949
Total number of cases of probable typhoid fever in eight regiments of the Third Division	2,726
Excess of cases of probable typhoid fever in the Third Division over those in the Second Division	777
Total number of cases of probable typhoid fever developed in eight regiments of the Second Division at Chickamauga.	833
Total number of cases of probable typhoid fever developed in eight regiments of the Third Division at Chickamauga.	1,604
Excess of cases of probable typhoid fever developed at Chickamauga in the Third Division over those developed in the Second Division	771
Total number of deaths in eight regiments of the Second Division	126
Total number of deaths in eight regiments of the Third Division	188
Excess of deaths in the Third Division over those in the Second Division	62

Total number of deaths from typhoid fever in eight regiments of the Second Division	103
Total number of deaths from typhoid fever in eight regiments of the Third Division	169
Excess of deaths from typhoid fever in the Third Division over those in the Second Division	66
Percentage of deaths among probable cases of typhoid fever in the Second Division	5.28
Percentage of deaths among probable cases of typhoid fever in the Third Division	6.19

We certainly must conclude from the above given figures that the general idea prevalent among medical officers at Chickamauga that typhoid fever was much more prevalent in the Third Division of the First Army Corps than in the Second Division of the same corps is correct. Typhoid fever diffused more rapidly and more widely through the Third Division than it did through the Second Division. Whether or not the greater prevalence of typhoid fever in the Third Division was due to the fact that the regiments of this division used Chickamauga Creek water we will not at present attempt to determine. We will leave the discussion of this subject until we have studied typhoid fever in the Third Corps.

Summary of deaths in the Third Division of the First Army Corps.

Brigade and regiment.	Total deaths.	Deaths due to typhoid fever.
<i>First Brigade.</i>		
Fifth Pennsylvania	16	16
Twelfth Minnesota	19	19
First South Carolina	20	10
Total	56	45
<i>Second Brigade.</i>		
Eighth Massachusetts	30	19
Twenty-first Kansas	23	21
Twelfth New York	21	20
Total	74	60
<i>Third Brigade.</i>		
Second Missouri	20	19
First New Hampshire	32	30
Ninth Pennsylvania	27	25
Total	79	74
Total deaths	210	
Deaths due to typhoid fever	190	
Percentage of deaths from typhoid to total deaths	85.71	

In comparing the extent to which typhoid fever prevailed in the different organizations of this corps, one question that very naturally arises is: Did the regiments that remained at Chickamauga suffer more or less from typhoid than those that left Chickamauga earlier in the season? In order to study this question we will divide the regiments of this corps into two groups. The first group will contain those regiments that left Chickamauga before August 3, 1898; the second group will contain those regiments which left Chickamauga subsequent to August 3, 1898. We will endeavor to ascertain which of these groups of regiments suffered more severely from typhoid fever and which had the greater death rate. In making this comparison we will have to depend upon the total number of deaths and the deaths attributed to typhoid fever.

FIRST GROUP.

Regiments.	Total deaths.	Deaths from typhoid.	Per cent of deaths among probable cases.	Per cent of deaths among recognized cases.
First Kentucky.....	28	18	6.87	20.45
Third Wisconsin.....	36	25	6.61	23.36
Fifth Illinois.....	16	8	6.4	7.08
Fourth Ohio.....	26	19
Third Illinois.....	44	25	4.57	16.77
Fourth Pennsylvania.....	35	24
Sixteenth Pennsylvania.....	41	34
Second Wisconsin.....	41	27	8.20	23.89
Third Kentucky.....	17	11	5.02
One hundred and sixtieth Indiana.....	11	8	3.38	17.02
First South Carolina.....	20	10

SECOND GROUP.

Thirty-first Michigan.....	27	16	6.69	18.60
First Georgia.....	10	9	7.50	25
One hundred and fifty-eighth Indiana.....	12	10	7.81	20.40
Sixth Ohio.....	21	19	6.52	12.83
First West Virginia.....	15	12	4.61	11.32
First Pennsylvania.....	14	12	5.40	7.10
Fourteenth Minnesota.....	13	12	4.19	8.21
Second Ohio.....	14	13	3.22	6.77
Fifth Pennsylvania.....	16	16	4.73	10.52
Twelfth Minnesota.....	19	19	4.38	13.19
Eighth Massachusetts.....	30	19	6.98	12.10
Twenty-first Kansas.....	23	21	7.14	22.10
Twelfth New York.....	21	20	4.08	13.89
Second Missouri.....	20	19	7.09	10.49
First New Hampshire.....	32	30	10.10	14.08
Ninth Pennsylvania.....	27	25	7.48	16.12

Eleven regiments in the first group lost from all causes. 315
 These 11 regiments had an aggregate strength when they left Chickamauga of 13,814
 The percentage of deaths from all causes in the 11 regiments that left Chickamauga early 2.28
 The 16 regiments in the second group lost from all causes. 314
 These 16 regiments had an aggregate strength when they left Chickamauga of 20,361
 The percentage of deaths from all causes in the 16 regiments of the second group, which left Chickamauga later, is. 1.54

It will be seen from these figures that so far as loss by deaths from all causes goes these two groups did not differ much, the loss being slightly greater in the regiments that left Chickamauga early.

The 11 regiments in the first group lost by death from typhoid fever 209
 The percentage of deaths from typhoid fever in the 11 regiments that left Chickamauga early 1.5
 The 16 regiments in the second group lost by deaths from typhoid fever 272
 The percentage of deaths from typhoid fever in the 16 regiments that remained longer at Chickamauga. 1.33

It will be seen from these figures that while there is a marked difference in the percentage of total deaths in these two groups the percentages of deaths from typhoid fever differ less.

Seven regiments out of the first group had among the probable cases of typhoid fever a death rate of 5.86 per cent.

Sixteen regiments in the second group had among the probable cases of typhoid fever a death rate of 5.81 per cent.

These figures, in our opinion, furnish additional evidence to our claim that we have not overestimated the number of cases of typhoid.

We will next inquire whether or not the regiments

that went to Porto Rico suffered more severely by deaths from all causes than did the regiments that remained in this country. The following figures bear upon this inquiry:

The seven regiments of this corps that went to Porto Rico had a total loss by death of 251. The aggregate strength of these regiments on leaving Chickamauga was 8,750.

The percentage of deaths from all causes among the regiments that went to Porto Rico was 2.86.

The percentage of deaths from all causes among the regiments that remained at Chickamauga was 1.49.

It will be seen from these figures that the loss of life was increased by sending these troops to Porto Rico.

The following table gives figures showing the most important facts concerning typhoid fever in the First Army Corps:

FIRST DIVISION.

Brigade and regiment.	Date of first case.	Total number of cases.	Number of recognized cases.	Total deaths.	Deaths from typhoid.	Per cent of deaths among probable cases.	Per cent of deaths among recognized cases.
<i>First Brigade.</i>							
First Kentucky <i>a</i>	June 19	262	88	28	18	6.87	20.45
Third Wisconsin <i>a</i>	May 24	378	107	36	25	6.61	23.36
Fifth Illinois.....	May 16	125	113	16	8	6.40	7.08
<i>Second Brigade.</i>							
Fourth Ohio <i>a</i>	May 17	26	19
Third Illinois <i>a</i>do.....	546	149	44	25	4.57	16.77
Fourth Pennsylvania <i>a</i>	June 1	35	24
<i>Third Brigade.</i>							
Sixteenth Pennsylvania <i>a</i>	May 8	41	34
Second Wisconsin <i>a</i>	May 11	329	113	41	27	8.20	23.89
Third Kentucky.....	June 9	219	17	11	5.02

a These regiments went to Porto Rico.

SECOND DIVISION.

<i>First Brigade.</i>							
Thirty-first Michigan.....	June 1	239	86	27	16	6.69	18.60
One hundred and sixtieth Indiana.....	July 4	223	47	11	8	3.58	17.02
First Georgia.....	June 6	120	36	10	9	7.50	25
<i>Second Brigade.</i>							
One hundred and fifty-eighth Indiana.....	June 6	128	49	12	10	7.81	20.40
Sixth Ohio.....	May 18	291	148	21	19	6.52	12.83
First West Virginia.....	June 6	260	106	15	12	4.61	11.32
<i>Third Brigade.</i>

Ninth Pennsylvania.....	May 31	334	155	27	25	7.48	16.12

The total number of cases of probable typhoid fever in this corps, excluding the 7 regiments that went to Porto Rico, and the First South Carolina, is	5,242
The aggregate strength of these 19 regiments was	24,262
The percentage of typhoid fever among these 19 regiments was	21.62
The total number of deaths from typhoid fever in these 19 regiments was	299
The percentage of deaths among probable cases of typhoid fever was	5.70

This percentage is too low, for two reasons—first, it is certain that we have not been able to obtain a complete list of deaths; second, in the list of deaths as we have given it, several cases attributed to other causes were undoubtedly due to typhoid fever.

In these 19 regiments the number of recognized cases of typhoid fever was	2,384
The percentage of deaths among recognized cases of typhoid fever was	12.54

Of course this last statement can not be correct, because all the deaths from typhoid fever did not occur among the recognized cases. From these figures we have no hesitancy in concluding that our list of probable typhoid fevers more nearly represents the actual number than does the list of recognized cases.

In this tabular statement of the First Army Corps are included seven regiments of the First Division, which started early for Porto Rico, and the First South Carolina Regiment (Third Division). The records of these eight regiments are very incomplete, and they have therefore been omitted from the general summary of the statistics of the board on the next page.

Summary of deaths in the First Army Corps.

FIRST DIVISION.	
Total deaths	284
Deaths due to typhoid fever	204
Percentage of deaths from typhoid to total deaths	71.837
SECOND DIVISION.	
Total deaths	137
Deaths due to typhoid fever	111
Percentage of deaths from typhoid to total deaths	81.02
THIRD DIVISION.	
Total deaths	208
Deaths due to typhoid fever	179
Percentage of deaths from typhoid to total deaths	86.06
Total deaths in the First Army Corps	629
Deaths due to typhoid fever in the First Army Corps	494
Percentage of deaths from typhoid to total deaths in the First Army Corps	78.53

Table showing for certain regiments of the First Army Corps assembled at Chickamauga the mortality and morbidity from typhoid fever.

FOURTEENTH NEW YORK VOLUNTEER INFANTRY.

First Brigade, First Division, Third Army Corps.

In the May report Maj. John Macumber in charge makes the following statement:

This regiment, formerly the Fourteenth, National Guard, New York, was mustered into the United States service at Camp Black, Hempstead, Long Island—the first battalion May 13, 1898, and the

second and third May 18, 1898. It proceeded thence by rail to Chickamauga Park, Ga., and arrived May 20, 1898. The camp at Chickamauga is located on a narrow strip of woodland running northwest by southeast. It occupies a ridge near Chickamauga Creek. The ground consists of a thin covering of soil—clay and sand—resting on a bed of rock. There is not enough soil in places to hold the tent pegs. The sloping nature of the ground gives good surface drainage, but the rock beneath forms a basin which prevents subsoil drainage. The prevailing conditions requiring treatment are heat prostrations and diarrhea, the one frequently complicating the other. The use of liquor sometimes acts as a predisposing cause of heat prostration, though as a rule the men are very temperate. The water is of poor quality and of insufficient quantity. Enough containers, boilers, and buckets are not furnished to make it practicable to supply the men with boiled water, which is very essential. The food is of good quality and of sufficient quantity, though too much salt pork and too little fresh meat has been issued. The men are just now learning how to prepare the food furnished so as to make the most of it. Two cases of pneumonia, now convalescent, are the only serious cases of illness. Eight or ten men, by misrepresentation, passed the medical examination and have been since found unfit for duty. These will be recommended for discharge. They are epileptics and syphilitics.

CONDENSED SICK REPORT FROM MAY 13 TO 31, INCLUSIVE.

Mean strength.....	913
Diarrhea.....	28
Remittent malaria.....	1
Other diseases.....	50
Total.....	79

There is no case of diarrhea here reported in the list of completed cases that lasted more than two days. Among the incomplete cases several were admitted after May 25 and remained in hospital May 31. These will probably appear in the June report.

The June report is signed by Arthur H. Bogart, who makes the following statement:

The prevailing diseases during the month have been those involving the intestinal tract—diarrhea and typhoid fever. Four cases of the latter have been developed, probably as a result of the carelessness on the part of the men in drinking water which had

not been boiled. Orders have been issued condemning this practice and are being rigidly enforced. The sanitary conditions have been carefully watched. No other source of infection has been found. The cases of diarrhea have, as a rule, been mild and have responded promptly to treatment.

CONDENSED SICK REPORT FOR JUNE.

Diarrhea.....	142
Remittent malaria.....	10
Intermittent malaria.....	2
Malarial fever.....	3
Typhoid fever.....	2
Dysentery.....	1
Other diseases.....	80
Total	240

It will be observed that the surgeon states in his comments that there are four cases of recognized typhoid fever. Only two occur so diagnosed in the report; these are as follows:

Private W. E., of Company I: June 19 to 27. This man's illness began much earlier than is indicated by the above figures. He is recorded as having had diarrhea from June 12 to 14, and diarrhea again June 18 and 19. According to this, admission to the sick report should be June 12. The second case is that of a private, E. C., of Company A, who was taken sick June 14 and sent to hospital June 30. This man's illness also began earlier than is indicated. He had diarrhea from June 12 to 14. On the latter date he was returned to duty and on the next day reported sick with typhoid fever. This brings the initial date in this case also to June 12.

The July report is signed by Captain Bogart. It contains the following statement:

The prevailing diseases in this command during the month have been diarrhea, rheumatism, malaria, bronchitis, and an occasional case of typhoid fever. The diarrheal cases were most common during the early part of the month and were probably due to the quality of the water, which has been much improved by the use of the filters recently furnished, and also by boiling. Malaria has been more common during the last ten days, and is undoubtedly due to the fact that the men are sleeping on the damp ground. This also has caused bronchitis and rheumatism. An attempt has been made to procure board floors or other suitable material in order to prevent a continuation of these diseases. The cases of typhoid fever have been numerous, and the source of infection is not easily traced. Possibly it may be due to the habit that the men have of drinking from springs wherever they may be found. This practice has been strenuously forbidden and all springs filled.

Total	648

September 3, 1898, this regiment left Chickamauga Park and proceeded to Brooklyn, N. Y., where it was disbanded.

The last report covers the period from September 1 to 14. This report is signed by Major Bogart without comment.

CONDENSED SICK REPORT FROM SEPTEMBER 1 TO 14.

Mean strength.....	1, 257
Malaria.....	198
Typhoid fever.....	9
Diarrhea.....	7
Other diseases.....	10
Total	224

We will not give a list of the probable cases of typhoid fever, but will content ourselves with a summary.

We find in the records of this regiment, together with those of the hospitals to which the sick from the regiment were sent, the names of 233 individuals who had protracted fever. These were diagnosed as follows:

Typhoid fever.....	95
Diarrhea.....	5
Dysentery.....	1
Malaria.....	132
Total	233

It must not be understood that 95 cases were diagnosed as typhoid fever in the regimental records, but we find this number with a diagnosis of typhoid fever in either the regimental or hospital record.

SUMMARY.

Assembled at Camp Black, Hempstead, Long Island, in April, 1898.

Mustered into United States service, May 13, 1898.

Arrived at Chickamauga Park, Ga., May 20, 1898.

Strength on arrival, 913.

Date of first case of probable typhoid fever, May 23, 1898.

Date of first case of recognized typhoid fever, June 12, 1898.

Left Chickamauga Park, Ga., September 3, 1898.

Strength on departure, 1,277.

Number of cases of probable typhoid fever developed at Chickamauga

Went from Chickamauga Park to Brooklyn, N. Y., and there disbanded.

Number of cases of probable typhoid fever developed after leaving Chickamauga Park..... 33

Total number of cases of probable typhoid fever developed in the Fourteenth New York Volunteer Infantry from May to September, 1898..... 233

These 233 cases were diagnosed as follows:

Typhoid fever..... 95
Malaria..... 132
Diarrhea..... 5
Dysentery..... 1

Total..... 233

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Bertholf, Clarence S.	Pvt., A.	1898. Nov. 4	Brooklyn, N. Y.	Tuberculosis pulmonalis, empyema, inanition, acute diffuse nephritis.
Borton, Alfred M.	Hosp. st.	Sept. 18	Anniston, Ala.	Typhoid.
Briarty, Fred	Pvt., (?)	Sept. 14	New York, N. Y.	Do.
Brown, Emanuel	Pvt., A.	Sept. 28	First Division hospital, Anniston, Ala.	Do.
Chevalier, Andrea	Pvt., M.	Sept. 17	Sternberg General Hospital, Chickamauga, Ga.	Do.
Clark, Edward P.	Pvt., A.	July 5	First Division, Third Army Corps, hospital, Camp Thomas, Ga.	Do.
Cooney, James J.	Pvt., I.	Sept. 3	Sternberg General Hospital, Chickamauga, Ga.	Do.
Fricke, Conrad, jr.	Pvt., M.	Oct. 13	Brooklyn, N. Y.	Do.
Hall, Emil	Pvt., G.	Oct. 14	Brooklyn Hospital, Brooklyn, N. Y.	Do.
Hayden, Erick	Pvt., G.	Aug. 15	Chickamauga, Ga.	Do.
Hayes, William	Pvt., E.	Sept. 16	Division hospital, Anniston, Ala.	Do.
Joyce, Barrington	Pvt., I.	Aug. 11	Chickamauga Park, Ga.	Do.
Kirk, Charles T.	Mus., B.	Sept. 15	Chickamauga Park, Ga.	Do.
Kurz, Emil R.	Pvt., B.	Sept. 28	Long Island College Hospital, Brooklyn, N. Y.	Malaria.
Layton, Geo. S.	Quasgt., B.	Sept. 20	Brooklyn, N. Y.	Typhoid.
McCoy, Charles E.	Pvt., I.	Oct. 15	do	do
McDonough, W. J.	Pvt., M.	Sept. 20	Brooklyn Hospital, Brooklyn, N. Y.	Malaria.
Mackey, Herbert E.	Pvt., H.	Nov. 2	St. Mary's Hospital, Brooklyn, N. Y.	Phthisis.
Mahoney, Henry C.	Corpl., F.	Sept. 21	Anniston, Ala.	Typhoid.
Martin, James C.	Pvt., K.	Aug. 11	Chickamauga, Ga.	Cardiac asthma.
Nelson, Charles	Pvt., G.	Oct. 27	Camp Thomas, Ga.	Typhoid.
O'Neill, Thomas E.	Pvt., E.	Nov. 6	St. Peter's Hospital, Brooklyn, N. Y.	Do.
Platts, W. G.	Pvt., C.	Sept. 5	Anniston, Ala.	Spinal meningitis.

Reed, Oscar	Artif., G.	do	Anniston, Ala.	Do.
Rickle, W. H.	Corpl., K.	Sept. 30	Chickamauga, Ga.	Do.
Ryan, Patrick	(?), F.	Sept. 3	Brooklyn, N. Y.	Do.
Scriven, Fred	Pvt., L.	Sept. 6	Chickamauga, Ga.	Peritonitis.
Smith, Stanley A.	Corpl., K.	Sept. 22	Camp Shipp, Ala., field hospital, First Division, Third Army Corps.	Typhoid pneumonia.
Weismantel, Joseph	Pvt., C.	Sept. 7	Anniston, Ala.	Typhoid.
Witz, Anton, jr.	Pvt., I.	Sept. 25	Chickamauga, Ga.	Do.

Total deaths..... 31

Deaths from typhoid fever..... 24

Percentage of deaths among probable cases of typhoid fever (233), 10.30.

Percentage of deaths among recognized cases of typhoid fever (95), 25.26.

It is more than probable that the cases in the above list in which cause of death is not given were due to typhoid fever. It will be seen from this that the probabilities are that in our list of probable cases we have not included all actual cases of typhoid fever.

COMMUNICATIONS FROM THE SURGEONS OF THE FOURTEENTH NEW YORK VOLUNTEER INFANTRY.

Medical officers.

Arthur Bogart, major and surgeon, Brooklyn, N. Y.

Thomas B. Spruce, captain and assistant surgeon, Brooklyn, N. Y.

Under date of July 13, 1899, Major Bogart makes the following statement:

The name of Private Fred Briarty, who died September 14, 1898, of typhoid fever at the German Hospital, New York, should be added to the list of deaths.

From Chickamauga Park the regiment was ordered to Anniston, Ala., on September 3, arriving there on the morning of the 4th, where it camped until September 14, when it was ordered home to Brooklyn, arriving there September 16, and was mustered out of service October 27, 1898.

It is evident, from your summary, that the number of typhoid cases has been very much overestimated. It can not be supposed that every case of protracted fever contracted in the Southern camps was typhoid; moreover, all of these cases were observed by a number of men both competent and anxious to arrive at correct conclusions regarding their nature, and the diagnosis as found in the regimental reports were confirmed at the division hospital before the reports were sent forward. There was, without any doubt, a great deal of malaria in the Southern camps. I do not know that I can add anything more of value to the report. Regarding the sanitary conditions of the camps, I have but little to say other than that they were not what they should have been at Chickamauga, while at Anniston they were excellent.

Comment: With the additional death given by Major Bogart, the percentage of deaths among the number of cases of probable typhoid fever reaches 10.30. We are quite confident that a death rate of more than 10 per cent proves beyond peradventure that we have not overestimated the number of cases of typhoid fever in this regiment.

FIRST MISSOURI VOLUNTEER INFANTRY.

First Brigade, First Division, Third Army Corps.

In the May report, Lieutenant Welch, in charge, makes the following statement:

The regiment was mustered into the service May 13 at Jefferson Barracks, Mo., and left on May 18 for Chickamauga, arriving at the latter place May 21. When the command was en route from Jefferson Barracks to Chickamauga it suffered a railroad collision at Rossville, Ga., in which Artificer George M. Walker, of Company D, was killed from compound fracture of skull; Private Alfred McLean, of Company M, suffered a dislocation of left femur at hip joint; Private Howard Erolaski, of Company B, had a fracture of articular cartilage at left hip joint; Private Lavanberg, of Company A, suffered from multi-contusions of the trunk; Private Richard Sidel, Company H, had a severe sprain of back, and First Lieutenant Richards a lacerated wound of left thumb. These patients were taken to St. Vincent's Hospital, Chattanooga, Tenn., for treatment. They are recovering. The general health of the command has been exceedingly good. The most common illness has been acute diarrhea, which in the main was easily relieved by simple remedies.

CONDENSED SICK REPORT FROM MAY 13 TO MAY 31, INCLUSIVE.

Mean strength	1,021
Diarrhea	43
Intermittent malaria	2
Other diseases and accidents	30
Total	75

All of the diarrheas in this report were of less than three days' duration, and there is no evidence in this record of the existence of typhoid fever in the regiment at this time.

In the June report Lieutenant Welch makes the following statement:

The camp is in excellent condition, clean, well policed and drained.

CONDENSED SICK REPORT FOR JUNE.

Mean strength	1,328
Diarrhea	105
Dysentery	3
Intermittent malaria	38
Acute enteritis	3
Typhoid fever	1
Other diseases and accidents	69
Total	219

The recognized case of typhoid fever was that of a private in Company B. The initial date of the illness in this case is given as June 28. In the July report Lieutenant Welch states:

The general health of the command has been good. While the percentage of sick was rather high, still the great majority of the cases treated yielded promptly to treatment, and the men were soon returned to duty. There has been a decided decrease in the number of cases of acute diarrhea. I think this is in the main due to the fact that the men are becoming more accustomed to camp life and that the drinking water is being filtered and boiled to a great extent. A few cases of typhoid fever developed previous to the boiling of the drinking water. Since the boiling of the water, I apprehend little trouble from typhoid fever. The prevalence of malarial fever is due to the region and latitude of Camp Thomas, to the nonacclimatization of most of the soldiers, to the rainy weather, and to the season of the year.

CONDENSED SICK REPORT FOR JULY.

Mean strength	1,311
Typhoid fever	3
Diarrhea	89
Intermittent malaria	53
Remittent malaria	59
Enteritis	2
Dysentery	5
Other diseases	141
Total	352

Of the three recognized cases of typhoid fever, one was brought over from the June report. The others were sent to Leiter Hospital.

A detachment, consisting of Companies D, H, I, and M of this regiment, numbering 489 men, seems to have

been separated from the rest of the regiment during the entire month of July. This detachment gives the following list:

Intermittent malaria	6
Continued malaria	1
Diarrhea	11
Enteritis	5
Other diseases	10
Total	33

The case of continued malaria was that of a private in Company M, and his name first occurs on sick report July 29.

In the August report Lieutenant Welch makes the following statement:

The most prevalent disease was malarial remittent fever. This was due in the main to nonacclimatization of the men, the wet weather, and the leaky condition of a great many tents and the crowding of six men in a tent. We have had a few cases of typhoid fever. I can not account for them unless the men drank some water that had not been boiled. To prevent the malarial fever, I gave large doses of quinine to all of the men in the regiment; the drinking water was boiled to prevent typhoid fever.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength	1,275
Diarrhea	76
Typhoid fever	5
Remittent malaria	125
Intermittent malaria	27
Dysentery	10
Enteritis	2
Other diseases	151
Total	396

Of the recognized cases of typhoid fever in this report four had their initial date in July and the fifth on August 3.

In the September report Lieutenant Welch makes the following statement:

From September 1 to 4 this regiment was encamped at Chickamauga, and on the latter day it left this place for Jefferson Barracks, Mo. On September 10 the regiment was furloughed with the exception of a guard of 60 men, the furlough to expire October 10. The main prevalent disease has been malarial fever. A great many cases developed shortly after our arrival at Jefferson Barracks. Most of these men were sent to City Hospital at St. Louis and to their homes. The health of that part of the regiment remaining in camp has been very good.

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength	1,262
Typhoid fever	3
Intermittent malaria	18
Remittent malaria	119
Diarrhea	28
Dysentery	4
Other diseases	37
Total	209

Of the three recognized cases of typhoid fever two are brought over from the August report and the third had its initial date September 6.

The following is a list of the probable cases of typhoid fever in this regiment:

- No. 1. Diarrhea, May 31 to June 12.
- No. 2. Enteritis, June 1; sent to Leiter Hospital June 15. Here the diagnosis was changed to intermittent malaria, and the patient was furloughed July 11.
- No. 3. Enteritis, June 2 to 19.
- No. 4. Diarrhea, June 7 to 18.
- No. 5. Dysentery, June 10 to 22.
- No. 6. Diarrhea, June 12; still sick July 31. There is no further record of this patient.
- No. 7. Diarrhea, June 18 to July 19.
- No. 8. Typhoid fever, June 28; discharged August 25. This man had diarrhea May 18 to 20.
- No. 9. Enteritis, July 7 to 25. This man had dysentery June 23 to 27.
- No. 10. Intermittent malaria, July 7; sent to division hospital July 31. Here the diagnosis was changed to typhoid fever, and the patient is recorded as having been returned to duty August 8.
- No. 11. Remittent malaria, July 8 to 18.
- No. 12. Intermittent malaria, July 8 to 24.
- No. 13. Intermittent malaria, July 9; still sick July 31. There is no further record of this case.
- No. 14. Dysentery, July 11 to 24.
- No. 15. Intermittent malaria, July 19; furloughed August 11.
- No. 16. Typhoid fever, July 19; furloughed August 30.
- No. 17. Intermittent malaria, July 19; sent to Sternberg Hospital August 31. Here the diagnosis was changed to continued malaria, and the patient was furloughed October 4.
- No. 18. Intermittent malaria, July 20; still sick in division hospital August 31.
- No. 19. Typhoid fever, July 22; furloughed August 31.
- No. 20. Intermittent malaria, July 22 to August 21.
- No. 21. Intermittent malaria, July 23 to August 23.
- No. 22. Intermittent malaria, July 23 to August 31. This man had diarrhea, May 26 to 29.
- No. 23. Typhoid fever, July 24; died August 15. This man had diarrhea, June 15 and 16.
- No. 24. Remittent malaria, July 24 to September 30.
- No. 25. Malaria, July 26 to September 25. This man had diarrhea, June 1 to 3.
- No. 26. Remittent malaria, July 26; furloughed August 25.
- No. 27. Intermittent malaria, July 27; sent to Leiter Hospital July 28. Here the diagnosis was changed to continued malaria and the patient was returned to duty September 17.
- No. 28. Intermittent malaria, July 27; sent to division hospital August 12. Here the diagnosis was changed to typhoid fever, and the disposition of the patient is not given. This man had diarrhea, July 18 to 20.
- No. 29. Remittent malaria, July 27 to August 21.
- No. 30. Intermittent malaria, July 27; furloughed August 12.
- No. 31. Intermittent malaria, July 27 to September 8.
- No. 32. Typhoid fever, July 28; disposition not given. This is probably not the correct initial date of this case, because we find him registered in the report as having had diarrhea, from July 8 to August 7. It is probable that the initial date of the typhoid fever should be July 8.
- No. 33. Diarrhea, July 30 to September 26.
- No. 34a. Malaria, July 20; still sick August 31.
- No. 34. Typhoid fever, July 31 to September 22.
- No. 35. Malaria, August 1 to September 27.
- No. 36. Remittent malaria, August 2 to September 24.
- No. 37. Dysentery, August 2; still sick in Leiter Hospital August 31. This man had dysentery, July 21 to 26.
- No. 38. Malaria, August 2 to September 26.

- No. 39. Intermittent malaria, August 2 to September 24.
- No. 40. Malaria, August 2 to 20.
- No. 41. Typhoid fever, August 3. Disposition not given.
- No. 42. Dysentery, August 4 to September 25. This man had diarrhea, July 13 to 17. Diarrhea, July 20; left incomplete.
- No. 43. Remittent malaria, August 4 to 16.
- No. 44. Intermittent malaria, August 5; furloughed August 26.
- No. 45. Intermittent malaria, August 5; sent to Leiter Hospital August 28. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 24.
- No. 46. Remittent malaria, August 7 to 26.
- No. 47. Remittent malaria, August 7 to September 23.
- No. 48. Remittent malaria, August 8 to September 23.
- No. 49. Intermittent malaria, August 8; died September 1.
- No. 50. Remittent malaria, August 9; sent to division hospital August 10. Here the diagnosis was changed to diarrhea, and the patient was furloughed August 23.
- No. 51. Diarrhea, August 9 to September 26. This is probably not the correct initial date for this case, as elsewhere in the record he is registered as having diarrhea from June 11 to September 26.
- No. 52. Intermittent malaria, August 11; sent to Leiter Hospital August 25. Here the diagnosis was changed to typhoid fever, and the patient was furloughed October 22.
- No. 53. Malaria, August 11; furloughed August 23.
- No. 54. Remittent malaria, August 11 to September 25.
- No. 55. Diarrhea, August 14 to September 24.
- No. 56. Dysentery, August 14 to September 29.
- No. 57. Remittent malaria, August 14 to September 24.
- No. 58. Malaria, without date; sent to Sternberg Hospital August 14. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 2.
- No. 59. Malaria, without date; sent to Sternberg Hospital August 15. Here the diagnosis was changed to typhoid fever, and the patient was furloughed August 25.
- No. 60. Malaria, without date; sent to Sternberg Hospital August 15. Here the diagnosis was changed to typhoid fever, and the patient was furloughed August 28.
- No. 61. Malaria, without date; sent to Sternberg Hospital August 15. Here the diagnosis was changed to typhoid fever, and the patient was furloughed August 20.
- No. 62. Malaria, without date; sent to Sternberg Hospital August 15. Here the diagnosis was changed to typhoid fever, and the patient was furloughed August 29.
- No. 63. Malaria, without date; sent to Sternberg Hospital August 15. Here the diagnosis was changed to typhoid fever, and the patient died August 31. On the regimental record this man is registered as having had remittent malaria from July 28 to 31.
- No. 64. Malaria, without date; sent to Sternberg Hospital August 15. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 4.
- No. 65. Malaria, without date; sent to Leiter Hospital August 15. Here the diagnosis was changed to typhoid fever, and the patient died August 16.
- No. 66. Malaria, without date; sent to Leiter Hospital August 15. Here the diagnosis was changed to typhoid fever, and the patient was furloughed August 30.
- No. 67. Malaria, without date; sent to Sternberg Hospital August 15. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 4. It is quite evident from this record that several of the more serious malarials which had accumulated on the regiments were taken to the hospitals on August 15, and were there recognized as cases of typhoid fever.
- No. 68. Remittent malaria, August 16 to September 26. Elsewhere in the record this man is registered as having suffered from malaria from June 11 to September 26.
- No. 69. Malaria, without date; sent to Sternberg Hospital, August 17. Here the diagnosis was changed to typhoid fever, and the patient was furloughed August 25.

No. 70. Diarrhea, August 17 to September 24. Elsewhere this man is registered as having had diarrhea from August 14 to September 24.

No. 71. Intermittent malaria, August 17 to September 26.

No. 72. Malaria, without date; sent to Sternberg Hospital, August 17. Here the diagnosis was changed to typhoid fever, and the patient was furloughed August 25.

No. 73. Remittent malaria, August 18 to September 24.

No. 74. Intermittent malaria, August 18 to September 8.

No. 75. Remittent malaria, August 19; still sick September 30.

No. 76. Malaria, August 19 to September 28. This man had diarrhea, May 26 to 28.

No. 77. Typhoid fever, August 19; sent to Sternberg Hospital August 30.

No. 78. Malaria, without date; sent to Sternberg Hospital August 20. Here the diagnosis was changed to typhoid fever, and the patient was furloughed August 25.

No. 79. Remittent malaria, August 20 to September 23.

No. 80. Remittent malaria, August 20; still sick September 30.

No. 81. Intermittent malaria, August 20 to September 24.

No. 82. Malaria, August 20 to September 24. Elsewhere this man is recorded as having had diarrhea, August 29 to September 29.

No. 83. Remittent malaria, August 20; sent to Leiter Hospital August 23. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 7.

No. 84. Remittent malaria, August 20; furloughed September 8.

No. 85. Malaria, without date; sent to Sternberg Hospital August 20. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 10. This man had diarrhea, July 6 and 7.

No. 86. Remittent malaria, August 21; sent to Sternberg Hospital August 30. Here the diagnosis was changed to continued malaria, and the patient was furloughed September 21.

No. 87. Intermittent malaria, August 21 to September 8.

No. 88. Malaria, August 22 to September 23.

No. 89. Malaria, August 22 to September 24.

No. 90. Intermittent malaria, August 22; still sick September 30. This man had diarrhea, May 28 to 30; diarrhea, June 6 to 9.

No. 91. Malaria, August 22 to September 28.

No. 92. Malaria, August 22 to September 20. This man had remittent malaria, August 12 to 15.

No. 93. Intermittent malaria, August 22 to September 29. This man had diarrhea, June 22 and 23; intermittent malaria, June 20 to July 3; diarrhea, July 20 and 21.

No. 94. Malaria, without date; sent to Sternberg Hospital August 23. Here the diagnosis was changed to continued malaria, and the patient was furloughed October 4.

No. 95. Malaria, August 23 to September 26. Elsewhere this man is recorded as having had remittent malaria, August 19 to September 26.

No. 96. Malaria, August 23 to September 26.

No. 97. Malaria, without date; sent to Sternberg Hospital August 23. Here the diagnosis was changed to typhoid fever, and the patient was furloughed August 25.

No. 98. Malaria, without date; sent to Sternberg Hospital August 23. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 27.

No. 99. Malaria, without date; sent to Sternberg Hospital August 23. Here the diagnosis was changed to continued malaria, and the patient was furloughed September 4.

No. 100. Malaria, August 23 to September 25. Elsewhere this man is registered as having had remittent malaria July 12 to September 25.

No. 101. Malaria, without date; sent to Sternberg Hospital August 23. Here the diagnosis was changed to continued malaria, and the patient was furloughed August 29.

No. 102. Malaria, August 23; furloughed September 8.

No. 103. Intermittent malaria, August 23 to September 24.

No. 104. Malaria, August 23 to September 24. Elsewhere this man is registered as having had diarrhea from August 14 to September 26.

No. 105. Malaria, August 23 to September 26. Elsewhere this man is registered as having had remittent malaria from August 18 to September 26.

No. 106. Malaria, without date; sent to Sternberg Hospital August 23. Here the diagnosis was changed to diarrhea, and the man was furloughed August 29.

No. 107. Diarrhea, August 23; furloughed September 8.

No. 108. Malaria, without date; sent to Sternberg Hospital August 23. Here the diagnosis was changed to typhoid fever, and the man was furloughed September 4.

No. 109. Malaria, without date; sent to Sternberg Hospital August 23. Here the diagnosis was changed to continued malaria, and the patient was furloughed August 29.

No. 110. Remittent malaria, August 24; sent to division hospital August 24. Here the diagnosis was changed to typhoid fever, and the patient was discharged September 27.

No. 111. Intermittent malaria, August 24; still sick September 30.

No. 112. Malaria, August 24 to September 26. This man had diarrhea July 10 to 14; diarrhea again August 17 to September 26. We would infer from this that the initial date of the typhoid fever in this case was August 17.

No. 113. Malaria, without date; sent to Sternberg Hospital August 24. Here the diagnosis was changed to continued malaria, and the patient was furloughed September 4.

No. 114. Malaria, without date; sent to Sternberg Hospital August 24. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 6.

No. 115. Diarrhea, August 24 to September 30.

No. 116. Malaria, August 24 to September 30.

No. 117. Intermittent malaria, August 24 to September 30.

No. 118. Malaria, August 24; furloughed September 8. This man had diarrhea July 9 and 10; diarrhea, August 16 and 17.

No. 119. Malaria, August 25 to September 25. Elsewhere this man is recorded as having had diarrhea August 25 to September 25.

No. 120. Malaria, August 25; still sick September 30.

No. 121. Malaria, August 26 to September 6.

No. 122. Remittent malaria, August 26; still sick September 30.

No. 123. Malaria, August 26; furloughed September 7.

No. 124. Sent to Sternberg Hospital without diagnosis. Here the disease was diagnosed typhoid fever, and the patient was furloughed August 25.

No. 125. Sent to Sternberg Hospital without diagnosis August 26. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 3. This man had diarrhea May 17 to 24.

No. 126. Sent to Sternberg Hospital without diagnosis August 26. Here the disease was diagnosed typhoid fever, and the patient died August 30.

No. 127. Intermittent malaria, August 26 to September 28. This man had remittent malaria August 10 to 19.

No. 128. Sent to Sternberg Hospital August 26 without diagnosis. Here the disease was diagnosed continued malaria, and the patient was furloughed September 4.

No. 129. Diarrhea, August 27 to September 24.

No. 130. Sent to Sternberg Hospital August 27 without diagnosis. Here the disease was diagnosed as remittent malaria, and the patient was furloughed September 4.

No. 131. Malaria, August 27 to September 28. This patient is also registered as having had remittent malaria from August 25 to September 28.

No. 132. Malaria, August 27; still sick September 30. This patient is also registered as having had diarrhea from July 9 to September 3.

No. 133. Sent to Sternberg Hospital August 27 without diagnosis. Here the case was registered as one of typhoid fever, and the

patient was furloughed September 27. This man is registered as having had diarrhea from July 3 to 25.

No. 134. Malaria, August 27 to September 28. This man had dysentery July 9 and 10.

No. 135. Sent to Sternberg Hospital August 27 without diagnosis. Here the patient is registered as having remittent malaria and was furloughed September 4.

No. 136. Malaria, without date; sent to Sternberg Hospital August 28. Here the disease was diagnosed continued malaria, and the patient was furloughed September 4. This man is reported as having had remittent malaria July 23 and 24.

No. 137. Malaria, without date; sent to Sternberg Hospital August 28. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 20. This man had diarrhea July 6 and 7.

No. 138. Malaria, without date; sent to Sternberg Hospital August 28. Here the diagnosis was changed to continued malaria, and the patient was furloughed September 9.

No. 139. Malaria, without date; sent to Sternberg Hospital August 28. Here the diagnosis was changed to continued malaria, and the patient was furloughed September 5.

No. 140. Malaria, without date; sent to Sternberg Hospital August 28; furloughed September 9.

No. 141. Malaria, August 28; furloughed September 15. This man is also recorded as having had diarrhea from August 3 to September 15.

No. 142. Remittent malarial, August 28; still sick September 30.

No. 143. Malaria; sent to Sternberg Hospital August 26. Here the diagnosis was changed to typhoid fever, and the patient was furloughed October 4.

No. 144. Remittent malaria, August 29; furloughed September 8.

No. 145. Malaria, August 29; still sick September 30. This man is also reported as having had diarrhea August 10 to September 8.

No. 146. Malaria, August 29 to September 28. This man is also recorded as having had diarrhea August 29 to September 28.

No. 147. Malaria, August 29 to September 23.

No. 148. Malaria, August 30; sent to Sternberg Hospital without date; furloughed September 23.

No. 149. Malaria, August 30 to September 18.

No. 150. Remittent malaria, August 31; still sick September 30.

No. 151. Malaria, without date; sent to Sternberg Hospital August 31. Here the disease was diagnosed as typhoid fever, and the patient was furloughed October 9.

No. 152. Malaria, without date; sent to Sternberg Hospital August 31. Here the disease was diagnosed as typhoid fever, and the patient was furloughed September 17.

No. 153. Malaria, without date; sent to Sternberg Hospital August 31; furloughed September 4.

No. 154. Malaria, September 2; sent to Sternberg Hospital on the same date. Here the disease was diagnosed as typhoid fever, and the patient was furloughed September 4.

No. 155. Malaria, September 2; sent to Sternberg Hospital September 3. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 3.

No. 156. Malaria, without date; sent to Sternberg Hospital September 2. Here the disease was diagnosed as typhoid fever, and the patient was furloughed November 7.

No. 157. Malaria, September 3; sent to Sternberg Hospital September 4. Here the diagnosis was changed to continued malaria, and the patient was furloughed September 4.

No. 158. Malaria, without date; sent to Leiter Hospital September 3. Here the diagnosis was changed to typhoid fever and the patient was furloughed October 8.

No. 159. Typhoid fever, September 6; no disposition given.

No. 160. Malaria, September 8 to 26.

No. 161. Malaria, September 8 to 30.

No. 162. Malaria, September 8 to 26.

No. 163. Malaria, September 8 to 26.

No. 164. Malaria, September 8 to 26.

No. 165. Malaria, September 8 to 27.

No. 166. Malaria, September 8 to 27.

No. 167. Malaria, September 8; furloughed September 18.

No. 168. Malaria, September 8; furloughed September 19.

No. 169. Malaria, September 8 to 27.

No. 170. Malaria, September 8 to 28. Elsewhere this man is recorded as having had diarrhea from July 26 to September 28.

No. 171. Malaria, September 8 to 27.

No. 172. Malaria, September 8 to 28.

No. 173. Malaria, September 8 to 28.

No. 174. Malaria, September 8; furloughed September 16.

No. 175. Malaria, September 8; furloughed September 16.

No. 176. Malaria, September 8 to 27.

No. 177. Malaria, September 8; still sick September 30.

No. 178. Remittent malaria, September 8; furloughed September 19.

No. 179. Malaria, September 8; furloughed September 22.

No. 180. Malaria, September 8; still sick September 30.

No. 181. Malaria, September 8 to 26.

No. 182. Malaria, September 8 to 23.

No. 183. Malaria, September 8 to 27.

No. 184. Malaria, September 8; still sick September 30. This man had diarrhea July 26 to 28.

No. 185. Malaria, September 8 to 25.

No. 186. Malaria, September 8 to 29.

No. 187. Remittent malaria, September 8 to 24.

No. 188. Remittent malaria, September 8 to 19.

No. 189. Malaria, September 8 to 29.

No. 190. Malaria, September 8 to 23.

No. 191. Malaria, September 8 to 27. This man is also recorded as having had remittent malaria from August 16 to September 27.

No. 192. Malaria, September 8 to 26.

No. 193. Malaria, September 8 to 19.

No. 194. Malaria, September 8 to 26.

No. 195. Malaria, September 8 to 28.

No. 196. Malaria, September 8; still sick September 30.

No. 197. Malaria, September 8 to 28.

No. 198. Malaria, September 8 to 22.

No. 199. Remittent malaria, September 8 to 19.

No. 200. Remittent malaria, September 8 to 28.

No. 201. Remittent malaria, September 8 to 21. This man is also recorded as having had remittent malaria July 4 to September 28.

No. 202. Remittent malaria, September 8 to 18.

No. 203. Malaria, September 8 to 17.

No. 204. Malaria, September 8 to 28.

No. 205. Malaria, September 8 to 24.

No. 206. Malaria, September 8 to 27.

No. 207. Malaria, September 8 to 22.

No. 208. Malaria, September 8 to 28.

No. 209. Malaria, September 8 to 22.

No. 210. Malaria, September 11 to October 18.

No. 211. Malaria, September 14 to 23.

No. 212. Malaria, September 14 to October 17.

No. 213. Malaria, without date; sent to Fort McPherson September 16; returned to duty September 27.

No. 214. Remittent malaria, August 15 to September 15.

No. 215. Malaria, September 28 to October 12.

No. 216. Malaria, October 14 and 15.

SUMMARY.

Assembled at Jefferson Barracks, near St. Louis, Mo., in April, 1898.

Mustered into United States service May 13, 1898.

Arrived at Chickamauga Park, Ga., May 21, 1898.

Strength on arrival, 1,021.

Date of first case of probable typhoid fever, May 31, 1898.
 Date of first case of recognized typhoid fever, June 28, 1898.
 Left Chickamauga Park, Ga., September 4, 1898.
 Strength on leaving, 1,275.

Number of cases of probable typhoid fever developed at Chickamauga Park..... 158

Went from Chickamauga Park to Jefferson Barracks.
 Furloughed September 10, 1898.

Number of cases of probable typhoid fever developed after leaving Chickamauga Park..... 58

Total number of cases of probable typhoid fever developed in the First Missouri Volunteer Infantry from May to September..... 216

These 216 cases were diagnosed as follows:

Typhoid fever.....	46
Malaria.....	151
Diarrhea.....	13
Dysentery.....	4
Enteritis.....	2
Total.....	216

The following is an alphabetical list of all deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Bronschweig, G. F....	Pvt., M.	1898. Aug. 16	Chickamauga, Ga.....	(Typhoid); peritonitis, perforation of bowels.
Ernst, Oscar F.....	Pvt., H.	Aug. 31	Sternberg United States Field Hospital.	Typhoid.
Gant, Harley C.....	Artif., A.	Aug. 13	Chickamauga, Ga.....	(Typhoid); dysentery.
Henley, Thomas W....	Pvt., I.	Oct. 21	St. Louis, Mo.....	Do.
Jennings, Otto P.....	Corpl., H.	Oct. 6	do.....	Typhoid.
Kreidler, E. A.....	Corpl., B.	July 4	East Lake, Tenn.....	Do.
Kittrish, Jno.....	Pvt., M.	Aug. 30	Sternberg Hospital	Do.
Lange, Emile.....	Corpl., K.	Sept. 14	Camp Thomas, Ga.....	Do.
McConnell, Frank R..	Pvt., K.	Aug. 8	do.....	Peritonitis.
Overton, C. H.....	Pvt., B.	June 19	do.....	Cerebral spinal meningitis.
Parnelee, C. A.....	Corpl., A.	Aug. 31	St. Louis, Mo.....	(Typhoid) malarial.
Ratliffe, S. M.....	Pvt., B.	Aug. 15	Camp Thomas, Ga.....	Typhoid.
Sawyer, Eugene L.....	Pvt., C.	Oct. 14	Kirkwood, Mo.....	Do.
Wolff, Harry S.....	Pvt., D.	Sept. 19	St. Louis, Mo.....	Do.

Total deaths..... 14

Deaths from typhoid fever..... 11

Percentage of deaths among probable cases of typhoid fever (216), 5.09.

Percentage of deaths among recognized cases of typhoid fever (46), 23.91.

The cases in the above list in which the word typhoid occurs in parentheses were cases of typhoid fever, but in the official records at Washington death is attributed to the disease indicated outside of the parentheses.

FIFTH MARYLAND VOLUNTEER INFANTRY.

First Brigade, First Division, Third Army Corps.

The records concerning this regiment are very imperfect.

It reached Chickamauga Park, Ga., May 21, 1898, and left that place June 2, 1898. From Chickamauga this regiment was sent to Tampa, Fla., and became a part of the Fourth Army Corps.

The first report covers the period from June 9 to June 30, inclusive.

CONDENSED SICK REPORT FOR JUNE.

Mean strength	979
Diarrhea.....	94
Dysentery.....	3
Malaria.....	28
Other diseases.....	66
Total.....	191

The regiment was encamped at Tampa, Fla., during the period covered by this report.

CONDENSED SICK REPORT FOR JULY.

Mean strength	1,308
Diarrhea.....	168
Dysentery.....	17
Malaria.....	146
Other diseases.....	121
Total.....	452

The regiment continued in its camp at Tampa, Fla., during the month of July.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength.....	1,174
Diarrhea.....	159
Dysentery.....	4
Malaria.....	344
Other diseases.....	33
Total.....	540

This report includes only eleven companies, Company F having been detached. The regiment was moved from Tampa Garrison to Tampa Heights August 1; and from Tampa Heights to Huntsville, Ala., August 18.

CONDENSED SICK REPORT FROM SEPTEMBER 1 TO 4, INCLUSIVE.

Mean strength	1,174
Diarrhea.....	20
Malaria.....	61
Other diseases.....	31
Total.....	112

This report continues for only eleven companies, Company F remaining detached.

This regiment left Huntsville, Ala., September 5 and reached Baltimore, Md., September 7. It was then disbanded on furlough preparatory to being mustered out.

We have attempted to ascertain the nature of the diseases designated as "malaria" in the monthly regimental reports of the Fifth Maryland. In order to do this we have taken the completed cases reported in this regiment and divided them into groups according to periods of duration, as will be seen from the following:

So-called malarials in the Fifth Maryland.

Group 1. Of two days or less in duration.....	214
Group 2. Of more than two days and less than seven days in duration.....	125
Group 3. Of less than thirteen days and more than six days in duration.....	29
Group 4. Of more than twelve days in duration.....	104

A like attempt has been made to classify the so-called diarrheas in the same regiment, with the following results:

So-called diarrheas in the Fifth Maryland.

Group 1. Of two days or less in duration.....	228
Group 2. Of more than two days and less than seven days in duration.....	124
Group 3. Of less than thirteen days and more than six days in duration.....	20
Group 4. Of more than twelve days in duration.....	31

The following is a list of the recognized and probable cases of typhoid fever found in the records of this regiment:

No. 1. Company A: Typhoid fever, June 25; transferred to Baltimore June 30.

No. 2. Company M: Diarrhea, July 1 to 17.

No. 3. Company M: Typhoid fever, July 2; sent to hospital July 20. The name of the hospital to which this patient was sent is not given. It frequently happens in the records of this regiment that the name of the hospital and the date are omitted.

No. 4. Company L: Typhoid fever, July 15; furloughed from hospital September 22.

No. 5. Company I: Typhoid fever, July 15; furloughed August 24.

No. 6. Company G: Typhoid fever, July 15; furloughed from hospital August 21.

No. 7. Company D: Typhoid fever, July 15; transferred August 27.

No. 8. Company H: Typhoid fever, July 15; transferred August 27.

No. 9. Company E: Typhoid fever; sent to Fort McPherson July 15; transferred to hospital train August 31.

No. 10. Company C: Typhoid fever; sent to Fort McPherson July 15; furloughed August 9. This man is recorded as having had diarrhea July 1 to 12.

No. 11. Company F: Typhoid fever; sent to Fort McPherson July 15; furloughed August 9.

No. 12. Company D: Typhoid fever, July 16; furloughed July 22.

No. 13. Company M: Typhoid fever, July 16, furloughed September 22.

No. 14. Company not given: Malaria, July 16; furloughed July 20.

No. 15. Company E: Typhoid fever, July 16; furloughed August 22.

No. 16. Company E: Typhoid fever, July 16; furloughed August 21.

No. 17. Company K: Typhoid fever, July 16; furloughed August 25.

No. 18. Company K: Typhoid fever, July 19; transferred July 20.

No. 19. Company I: Typhoid fever, July 19; transferred July 20.

No. 20. Company H: Typhoid fever, July 20; transferred July 31.

No. 21. Company B: Typhoid fever, July 20; transferred August 2.

No. 22. Company H: Typhoid fever, July 20; transferred August 2.

No. 23. Company F: Sent to Fort Thomas July 22. Here the disease was diagnosed malaria, and the patient was still sick September 8.

No. 24. Company A: Typhoid fever, July 22; sent to hospital without date.

No. 25. Company I: Sent to Fort Thomas July 22. Here the disease was diagnosed typhoid fever, and the man was mustered out October 22.

No. 26. Company G: Typhoid fever, July 23; transferred August 2.

No. 27. Company K: Malaria, July 24 to August 26.

No. 28. Company H: Malaria, July 24; sent to brigade hospital without date.

No. 29. Company C: Malaria, July 25 to August 18.

No. 30. Company H: Malaria, July 26; furloughed August 26.

No. 31. Company I: Malaria, July 27; sent to brigade hospital without date.

No. 32. Company A: Malaria, July 28; sent to brigade hospital without date.

No. 33. Company B: Typhoid fever, July 28; sent to brigade hospital without date.

No. 34. Company B: Malaria, July 29; sent to brigade hospital without date.

No. 35. Company H: Sent to Fort McPherson July 29. Here the disease was diagnosed typhoid fever and the patient was furloughed August 20.

No. 36. Company D: Malaria, July 30; sent to brigade hospital without date.

No. 37. Company A: Malaria, July 30 to August 13.

No. 38. Company K: Typhoid fever, July 31; sent to brigade hospital without date.

No. 39. Company I: Malaria, August 2; sent to brigade hospital without date.

No. 40. Company M: Diarrhea and malaria, August 2 to 23.

No. 41. Company G: Typhoid fever, August 2; sent to brigade hospital without date.

No. 42. Company C: Malaria, August 3; sent to brigade hospital without date.

No. 43. Company E: Typhoid fever, August 3; sent to brigade hospital without date.

No. 44. Company G: Dysentery, August 4; furloughed August 12.

No. 45. Company M: Malaria, August 5; sent to brigade hospital without date.

No. 46. Company D: Malaria, August 5 to 17.

No. 47. Company B: Malaria, August 6; sent to brigade hospital August 25.

No. 48. Company D: Malaria, August 6; sent to brigade hospital without date.

No. 49. Company D: Typhoid fever, August 6; sent to brigade hospital without date.

No. 50. Company M: Typhoid fever, August 7; sent to brigade hospital August 13; furloughed August 26.

No. 51. Company M: Malaria, August 8; sent to brigade hospital without date.

No. 52. Company M: Typhoid fever, August 8; sent to brigade hospital without date.

No. 53. Company C: Diarrhea, August 8 to 22.

No. 54. Company B: Malaria, August 9; sent to field hospital without date.

No. 55. Company E: Malaria, August 9; sent to corps hospital without date.

No. 56. Company M: Sent to Fort McPherson August 10 without diagnosis. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 10.

No. 57. Company D: Malaria, August 11; sent to brigade hospital without date.

No. 58. Company H: Malaria, August 11 to 22.

No. 59. Company H: Typhoid fever, August 11; furloughed September 1.

No. 60. Company M: Malaria, August 14; sent to brigade hospital without date.

No. 61. Company E: Malaria, August 14; transferred without date.

No. 62. Company L: Malaria, August 14; sent to brigade hospital without date.

No. 63. Company C: Malaria, August 14; sent to brigade hospital without date.

No. 64. Company C: Malaria, August 15; furloughed August 23.

No. 65. Company B: Malaria, August 15; furloughed August 27.

No. 66. Company H: Dysentery, August 15; furloughed August 21.

No. 67. Company G: Malaria, August 16; furloughed August 22.

No. 68. Company G: Sent to Fort McPherson August 16 without diagnosis. Here the disease was diagnosed typhoid fever, and the patient died September 1.

No. 69. Company G: Malaria, August 16; furloughed August 22.

No. 70. Company E: Sent to Fort McPherson August 16 without diagnosis. Here the disease was diagnosed typhoid fever, and the patient was transferred to a hospital train August 31.

No. 71. Company G: Typhoid fever, August 16; sent to brigade hospital without date.

No. 72. Company G: Malaria, August 20; furloughed August 26.

No. 73. Company not given: Malaria, August 20; furloughed August 26.

No. 74. Company M: Typhoid fever, August 20; furloughed August 26.

No. 75. Company C: Malaria, August 20; furloughed August 26.

No. 76. Company G: Typhoid fever, August 20; furloughed August 26.

No. 77. Company L: Malaria, August 22; furloughed from hospital without date. In hospital this case was diagnosed typhoid fever.

No. 78. Company G: Typhoid fever, August 22; furloughed August 26.

No. 79. Company H: Typhoid fever, August 22; furloughed August 26.

No. 80. Company A: Malaria, August 22; furloughed August 26.

No. 81. Company L: Typhoid fever, August 22; furloughed August 26.

No. 82. Company A: Dysentery, August 22; furloughed August 26.

No. 83. Company D: Typhoid fever, August 22; furloughed September 6.

No. 84. Company D: Malaria, August 22; furloughed August 26.

No. 85. Company G: Typhoid fever, August 22; furloughed September 18.

No. 86. Company I: Malaria, August 22; furloughed August 26.

No. 87. Company F: Sent to hospital without diagnosis August 22. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 24.

No. 88. Company K: Malaria, August 23; furloughed August 26.

No. 89. Company I: Malaria, August 23; furloughed August 26.

No. 90. Company K: Malaria, August 23; furloughed August 26.

No. 91. Company A: Malaria, August 23; furloughed August 26.

No. 92. Company C: Malaria, August 23; furloughed August 26.

No. 93. Company L: Malaria, August 23; sent to brigade hospital without date.

No. 94. Company M: Typhoid fever, August 23; furloughed August 26.

No. 95. Company A: Malaria, August 23; furloughed August 26.

No. 96. Company A: Malaria, August 23; furloughed August 26.

No. 97. Company K: Malaria, August 23; furloughed August 26.

No. 98. Company C: Malaria, August 23; furloughed August 26. After reaching home this case was diagnosed typhoid fever.

No. 99. Company F: Malaria, August 23; furloughed September 25.

No. 100. Company I: Malaria, August 23; furloughed August 26.

No. 101. Company F: Malaria, August 24; furloughed August 26.

No. 102. Company M: Malaria, August 24; furloughed August 26.

No. 103. Company I: Typhoid fever, August 24; furloughed August 26.

No. 104. Company B: Typhoid fever, August 24; furloughed August 26.

No. 105. Company A: Malaria, August 24; furloughed August 26. At home this case was diagnosed typhoid fever.

No. 106. Company I: Typhoid fever, August 24; furloughed August 26.

No. 107. Company A: Malaria, August 25; sent to brigade hospital without date.

No. 108. Company A: Malaria, August 25; furloughed August 26.

No. 109. Company L: Malaria, August 26; furloughed August 26. After reaching home this case was diagnosed typhoid fever.

No. 110. Company M: Malaria, August 26; furloughed August 26. After reaching home this case was diagnosed typhoid fever.

No. 111. Company B: Malaria, August 26; sent to brigade hospital without date.

No. 112. Company C: Malaria, August 26; sent to brigade hospital without date.

No. 113. Company H: Typhoid fever, August 26; furloughed August 26.

No. 114. Company M: Malaria, August 26; sent to brigade hospital without date. Afterwards this man, still sick, was sent to Baltimore.

No. 115. Company F: Sent to hospital without diagnosis August 26. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 18.

No. 116. Company A: Malaria, August 27; sent to Maryland general hospital at Baltimore September 3. Here the disease was diagnosed typhoid fever, and the man was discharged October 29.

No. 117. Company E: Malaria, August 27; sent to brigade hospital without date.

No. 118. Company F: Malaria, August 27; transferred August 27.

No. 119. Company C: Malaria, August 27; sent to brigade hospital without date.

No. 120. Company I: Typhoid fever, August 27; furloughed September 15.

No. 121. Company E: Typhoid fever, August 27; furloughed without date.

No. 122. Company M: Typhoid fever, August 27; sent to brigade hospital August 27; furloughed September 15.

No. 123. Company H: Typhoid fever, August 27; sent to brigade hospital without date.

No. 124. Company H: Malaria, August 28; furloughed August 28.

No. 125. Company G: Malaria, August 28; furloughed September 1.

No. 126. Company M: Dysentery, August 28; furloughed September 1.

No. 127. Company B: Typhoid fever, August 28; died September 10.

No. 128. Company H: Malaria, August 29; sent to corps hospital without date.

No. 129. Company L: Malaria, August 29; sent to hospital at Baltimore without date. In this hospital the disease was diagnosed typhoid fever.

No. 130. Company B: Sent to Fort Monroe August 29 without diagnosis. Here the disease was diagnosed malaria, and the patient was furloughed September 17.

No. 131. Company H: Typhoid fever, August 29; sent to corps hospital without date.

No. 132. Company L: Typhoid fever, August 29; sent to brigade hospital without date.

No. 133. Company L: Malaria, August 30; furloughed September 1.

No. 134. Company H: Malaria, August 30; furloughed September 1.

No. 135. Company L: Malaria, August 30; furloughed September 1.

No. 136. Company G: Typhoid fever, August 30; transferred September 1.

No. 137. Company C: Typhoid fever, August 30; transferred September 14.

No. 138. Company E: Typhoid fever, August 30; sent to brigade hospital without date.

No. 139. Company K: Typhoid fever, August 30; sent to Baltimore without date.

No. 140. Company M: Typhoid fever, August 30; sent to corps hospital without date.

No. 141. Company D: Malaria, August 31; sent to brigade hospital without date.

No. 142. Company L: Typhoid fever, August 31; furloughed September 1.

No. 143. Company L: Malaria, August 31; sent to brigade hospital without date.

No. 144. Company M: Malaria, August 31; sent to brigade hospital without date.

No. 145. Company L: Malaria, August 31; furloughed September 1.

No. 146. Company L: Malaria, August 31; furloughed August 31.

No. 147. Company B: Typhoid fever, August 31; sent to Johns Hopkins Hospital September 1.

No. 148. Company L: Malaria, August 31; sent to brigade hospital without date.

No. 149. Company K: Malaria, August 31; sent to hospital at Baltimore without date.

No. 150. Company K: Typhoid fever, August 31; sent to brigade hospital without date.

No. 151. Company A: Malaria, August 31; furloughed without date.

No. 152. Company H: Malaria, September 1; sent to brigade hospital without date.

No. 153. Company C: Diarrhea, September 1; furloughed September 1.

No. 154. Company G: Malaria, September 1; sent to brigade hospital without date.

No. 155. Company H: Malaria, September 1; sent to brigade hospital without date.

No. 156. Company M: Malaria, September 1; sent to brigade hospital without date.

No. 157. Company C: Malaria, September 1; furloughed September 1.

No. 158. Company K: Malaria, September 1; sent to brigade hospital without date.

No. 159. Company E: Malaria, September 1; furloughed September 15.

No. 160. Company H: Typhoid fever, September 1; sent to brigade hospital without date.

No. 161. Company E: Malaria, September 1; furloughed September 1.

No. 162. Company E: Diarrhea, September 1; furloughed September 1.

No. 163. Company K: Typhoid fever, September 1; sent to brigade hospital without date.

No. 164. Company K: Malaria, September 2; sent to brigade hospital without date.

No. 165. Company E: Malaria, September 2; sent to brigade hospital without date.

No. 166. Company M: Malaria, September 2; sent to brigade hospital without date.

No. 167. Company A: Malaria, September 3; furloughed September 6.

No. 168. Company F: Malaria, September 3; sent to Johns Hopkins Hospital. Here the disease was diagnosed typhoid fever, and the patient was dismissed after forty-four days in hospital.

No. 169. Company B: Sent to Johns Hopkins Hospital without diagnosis September 3. Here the disease was diagnosed typhoid fever, and the patient was discharged after twenty-six days in hospital.

No. 170. Company H: Sent to Johns Hopkins Hospital without diagnosis September 3. Here the disease was diagnosed typhoid fever, and the patient was discharged after forty-two days in hospital.

No. 171. Company D: Sent to Johns Hopkins Hospital without diagnosis September 3. Here the disease was diagnosed typhoid fever, and the patient was discharged after forty-nine days in hospital.

No. 172. Company E: Sent to General Hospital at Baltimore without diagnosis September 3. Here the disease was diagnosed dysentery, and the patient was furloughed September 28.

No. 173. Company A: Sent to General Hospital at Baltimore without diagnosis September 3. Here the disease was diagnosed typhoid fever, and the patient was discharged October 24.

No. 174. Company C: Sent to Johns Hopkins Hospital without diagnosis September 3. Here the disease was diagnosed typhoid fever, and the patient was discharged after thirty-two days in hospital.

No. 175. Company A: Sent to General Hospital at Baltimore without diagnosis September 3. Here the disease was diagnosed typhoid fever, and the patient was discharged October 24.

No. 176. Company F: Sent to General Hospital at Baltimore without diagnosis September 3. Here the disease was diagnosed typhoid fever, and the patient was discharged October 10.

No. 177. Company L: Sent to General Hospital at Baltimore without diagnosis September 3. Here the disease was diagnosed malaria, and the patient was discharged September 26.

No. 178. Company K: Sent to Johns Hopkins Hospital without diagnosis September 3. Here the disease was diagnosed aestivo-autumnal fever, and the patient was discharged after seventeen days in hospital.

No. 179. Company E: Sent to hospital in Baltimore without diagnosis September 3. Here the disease was diagnosed typhoid fever, and the patient was discharged after thirty-one days in hospital.

No. 180. Company M: Sent to Johns Hopkins Hospital without diagnosis September 3. Here the disease was diagnosed typhoid fever, and the patient was discharged after thirty-eight days in hospital.

No. 181. Company F: Malaria, September 16; sent to hospital in Baltimore September 18.

No. 182. Company H: Sent to Fort McPherson without diagnosis September 28. Here the disease was diagnosed typhoid fever, and the patient was furloughed October 9.

The following additional cases are recorded without date:

No. 183. Company A: Sent to hospital in Baltimore, where the disease was diagnosed typhoid fever.

No. 184. Company B: Sent to hospital in Baltimore, where the disease was diagnosed typhoid fever.

No. 185. Company F: Sent to hospital in Baltimore, where the disease was diagnosed typhoid fever.

No. 186. Company M: Sent to University Hospital, Baltimore; typhoid fever.

No. 187. Company F: Sent to University Hospital, Baltimore; typhoid fever.

No. 188. Company H: Sent to University Hospital, Baltimore; typhoid fever.

No. 189. Company L: Sent to University Hospital, Baltimore; typhoid fever.

No. 190. Company not given. Sent to University Hospital, Baltimore; typhoid fever.

No. 191. Company B: Sent to University Hospital, Baltimore; typhoid fever.

No. 192. Company B: Sent to University Hospital, Baltimore; typhoid fever.

No. 193. Company M: Sent to University Hospital, Baltimore; typhoid fever.

No. 194. Company not given: Sent to University Hospital, Baltimore; typhoid fever.

No. 195. Company G: Sent to University Hospital, Baltimore; typhoid fever.

No. 196. Company I: Sent to University Hospital, Baltimore; typhoid fever.

No. 197. Company M: Sent to University Hospital, Baltimore; typhoid fever.

No. 198. Hospital Steward: Sent to University Hospital, Baltimore; typhoid fever.

No. 199. Company C: Sent to University Hospital, Baltimore; typhoid fever.

No. 200. Company F: Sent to University Hospital, Baltimore; typhoid fever.

No. 201. Company F: Sent to University Hospital, Baltimore; typhoid fever.

No. 202. Company C: Sent to University Hospital, Baltimore; malaria.

No. 203. Company E: Sent to University Hospital, Baltimore; typhoid fever.

No. 204. Company E: Sent to University Hospital, Baltimore. Here the patient died from intestinal hemorrhage.

No. 205. Company F: Sent to University Hospital, Baltimore; typhoid fever.

No. 206. Company I: Sent to University Hospital, Baltimore; typhoid fever.

No. 207. Company K: Sent to University Hospital, Baltimore; typhoid fever.

No. 208. Company L: Sent to University Hospital, Baltimore; typhoid fever.

No. 209. Company not given: Sent to University Hospital, Baltimore; typhoid fever.

No. 210. Company not given: Sent to University Hospital, Baltimore; typhoid fever.

No. 211. Company A: Sent to University Hospital, Baltimore; malaria.

No. 212. Company H: Malaria; sent to corps hospital without date.

No. 213. Company not given: Sent to University Hospital, Baltimore; typhoid fever.

No. 214. Company H: Sent to University Hospital, Baltimore; typhoid fever.

No. 215. Company I: Sent to University Hospital, Baltimore; typhoid fever.

No. 216. Company M: Sent to University Hospital, Baltimore; typhoid fever.

No. 217. Company not given: Sent to University Hospital, Baltimore; typhoid fever.

No. 218. Company D: Sent to University Hospital, Baltimore; typhoid fever.

No. 219. Company E: Sent to University Hospital, Baltimore; typhoid fever.

No. 220. Company E: Sent to University Hospital, Baltimore; typhoid fever.

No. 221. Company E: Sent to University Hospital, Baltimore; typhoid fever.

No. 222. Company D: Sent to general hospital, Baltimore; typhoid fever.

No. 223. Company I: Sent to general hospital, Baltimore; typhoid fever.

No. 224. Company M: Sent to general hospital, Baltimore; typhoid fever.

No. 225. Staff: Sent to general hospital, Baltimore; typhoid fever.

No. 226. Company not given: Sent to general hospital, Baltimore; typhoid fever.

No. 227. Company K: Typhoid fever, without date; sent to brigade hospital without date.

No. 228. Company D: Typhoid fever, without date; sent to corps hospital without date.

No. 229. Company not given: Sent to University Hospital, Baltimore; typhoid fever.

No. 230. Company B: Sent to University Hospital, Baltimore; typhoid fever.

No. 231. Company F: Sent to University Hospital, Baltimore; typhoid fever.

No. 232. Company G: Sent to University Hospital, Baltimore; typhoid fever.

No. 233. Company G: Sent to University Hospital, Baltimore; typhoid fever.

No. 234. Company I: Sent to University Hospital, Baltimore; typhoid fever.

No. 235. Company B: Sent to University Hospital, Baltimore; typhoid fever.

No. 236. Company F: Sent to University Hospital, Baltimore; typhoid fever.

No. 237. Company G: Sent to University Hospital, Baltimore; typhoid fever.

No. 238. Company I: Sent to University Hospital, Baltimore; died of intestinal perforation.

No. 239. Company not given: Sent to corps hospital without date. Here the disease was diagnosed typhoid fever.

No. 240. Company not given: Sent to corps hospital without date. Here the disease was diagnosed typhoid fever.

No. 241. Company L: Sent to University Hospital, Baltimore; typhoid fever; died of intestinal hemorrhage.

No. 242. Company E: Sent to University Hospital, Baltimore; typhoid fever.

No. 243. Company K: Sent to University Hospital, Baltimore; typhoid fever.

No. 244. Company K: Sent to University Hospital, Baltimore; typhoid fever.

No. 245. Company M: Sent to University Hospital, Baltimore; typhoid fever. The hospital record shows that this man had intestinal hemorrhage, without statement of result, from which it is inferred that he recovered.

No. 246. Company not given: Sent to University Hospital, Baltimore; typhoid fever; died. The typhoid fever in this case was complicated with pneumonia.

No. 247. Company not given: Sent to University Hospital, Baltimore; typhoid fever.

No. 248. Company not given: Sent to University Hospital, Baltimore; typhoid fever.

No. 249. Company G: Sent to University Hospital, Baltimore; typhoid fever.

No. 250. Company B: Sent to general hospital, Baltimore; typhoid fever.

SUMMARY.

Assembled near Baltimore, Md., in April, 1898.

Mustered into United States service about May 10, 1898.

Arrived at Chickamauga Park, Ga., May 21, 1898.

Strength on arrival, 979.

There were no cases of typhoid fever developed during the regiment's stay at Chickamauga Park.

Left Chickamauga Park June 2, 1898.

Strength on departure, 985.

Arrived at Tampa, Fla., June 5, 1898.

Date of first case of probable typhoid fever, June 25, 1898.

Date of first case of recognized typhoid fever, June 25, 1898.

Left Tampa garrison August 1, 1898.

Number of cases of probable typhoid fever developed at Tampa garrison	38
Reached Tampa Heights August 1, 1898.	
Left Tampa Heights August 18, 1898.	
Number of cases of probable typhoid fever developed at Tampa Heights	33
Reached Huntsville, Ala., August 21, 1898.	
Left Huntsville, Ala., September 5, 1898.	
Number of cases of probable typhoid fever developed at Huntsville, Ala.	109
Went from Huntsville, Ala., to Baltimore, Md.	
The number of cases of probable typhoid fever sent to hospitals in Baltimore	70
Total number of cases of probable typhoid fever developed in the Fifth Maryland Volunteer Infantry from May to September, 1898.	250

We fear that the distribution of cases as given in the above table is not correct. The records of the cases sent to hospitals in Baltimore have been furnished us without date. It is more than probable that many of these cases were furloughed from Tampa and Huntsville; therefore should have their initial dates much earlier than is indicated above.

These 250 cases were diagnosed as follows:

Typhoid fever.....	147
Malaria.....	89
Diarrhea.....	5
Dysentery.....	5
Hemorrhage from the bowels.....	2
Perforation of the bowels.....	1
Æstivo-autumnal fever.....	1
Total.....	250

The number of recognized cases of typhoid fever in this regiment would not have been so great had not so many of the cases been sent to hospitals. Very few cases were diagnosed typhoid fever by the regimental surgeons.

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
1898.				
Belt, Boyd G.....	Sgt., F.	Aug. 9	Tampa, Fla.....	Typhoid.
Brady, Edwin.....	Pvt., K.	Oct. 21	Baltimore, Md.....	Do.
Cook, George.....	Pvt., B.	Aug. 23	Tampa, Fla.....	Diffuse peritonitis.
Carrigan, N. J.....	Pvt., K.	July 29	Fort Thomas, Ky.....	Typhoid.
Childs, Lawrence.....	Pvt., D.	Oct. 19	Baltimore, Md.....	Do.
Fowler, Lemuel M.....	Pvt., H.	Sept. 16	do.....	Do.
Hopkins, M. R.....	Sgt., E.	Sept. 4	do.....	Do.
Housholder, J. E.....	Pvt., G.	Sept. 1	Fort McPherson, Ga.....	Do.
Johnson, Harry W.....	Pvt., F.	Sept. 14	Baltimore, Md.....	Do.
Kastner, James J.....	Pvt., A.	Aug. 22	West Tampa, Fla.....	Do.
Langbert, A. M.....	Pvt., B.	Sept. 10	Huntsville, Ala.....	Do.
Petzold, Charles P.....	Pvt., D.	Aug. 21	Tampa, Fla.....	Do.
Robinson, W. D.....	LT. Col.	Sept. 28	Atlanta, Ga.....	Do.
Stratmeyer, Louis B.....	Pvt., G.	Aug. 26	Fort McPherson, Ga.....	Do.
Summers, E. H.....	Pvt., I.	Sept. 23	Baltimore, Md.....	Do.
Weiszberger, H. L.....	Pvt., E.	Sept. 12	do.....	Do.
White, Albert A.....	Corpl., F.	Sept. 1	do.....	Do.
Wolfe, Thomas M.....	Pvt., A.	Aug. 21	Tampa Heights, Fla.....	Do.
Total deaths.....				18
Deaths due to typhoid fever.....				17
Percentage of deaths among probable cases of typhoid fever (250), 6.80.				
Percentage of deaths among recognized cases of typhoid fever (147), 11.56.				

Apparently this regiment did not carry any typhoid infection to Chickamauga nor receive any at that place. The first case, so far as we can ascertain, happened nearly three weeks after the regiment reached Tampa.

It is interesting to note that of 85 cases of protracted fever sent to the hospitals in Baltimore, where presumably blood tests were made, only 5 were found to be cases of malaria. Nearly all of these were sent to Baltimore with a diagnosis of malaria. Unfortunately, we have no detailed history of any of these cases, and it is impossible to say whether blood examinations were made in all of them or not. It is to be presumed that the malarial parasite was found in 5 out of the 85 cases. The æstivo-autumnal parasite was certainly found in 1 case. These figures probably give a very good idea of the relative frequency of malaria among the troops that remained in the United States.

COMMUNICATIONS FROM THE SURGEONS OF THE FIFTH MARYLAND VOLUNTEER INFANTRY.

Medical officers.

John G. Jay, major and surgeon, Baltimore, Md.

Samuel C. Davis, jr., captain and assistant surgeon, Baltimore, Md.

Thaddeus W. Clark, captain and assistant surgeon, Baltimore, Md.

Captain Davis states:

I do think that if Circular No. 1, dated at Surgeon-General's Office April 25, 1898, had been carried out, we would not have had the 225 or 250 cases of typhoid fever that we did have.

From a communication from Major Jay we condensed the following:

At Chickamauga the camp of this regiment was in a piece of woodland near the creek. The rocky character of the soil rendered the digging of pits to a sufficient depth impossible. There was no provision for obtaining water within the regimental lines. Drinking water was obtained by collecting surface water in pits dug in a swampy place. Some drinking water was obtained from Chickamauga Creek. I am convinced that the typhoid infection was introduced into our regiment at this time, although it did not develop until somewhere after we had been at Tampa. There is no good reason for believing that typhoid bacilli may not remain latent for at least three weeks, perhaps considerably longer in the body. After such a time these germs may be swept from the intestines, leaving their host unharmed; or, favorable conditions developing, such as result from fatigue, the germs may, weeks after exposure, develop the disease.

We arrived at Tampa, Fla., June 5, and were assigned to a position on "old garrison grounds," our camp being contiguous to those of the First District of Columbia and the Second New York. The three regiments were encamped upon an area which was no more than sufficient for one. About the only redeeming feature of this place was the drinking water, which was obtained from the city supply of Tampa and was supposed to be clear and wholesome. The cramped space allotted to our brigade was a source of much anxiety to myself and the other regimental surgeons, and we were not surprised when typhoid fever, diarrhea, and dysentery appeared. We were hemmed in on all sides by objectionable conditions. On one side was a corral of hundreds of horses and mules; on the opposite side was the shallow bay with its foul and widely extended black mud flats, which were exposed at every ebb tide, the breezes from thence bringing an odor resembling that from foul city sewers. On the other two sides, our animals and those of the First District of Columbia were unavoidably too near us. Our kitchen and privy sinks were not more than 60 feet from the mess tents. Before we left there was no available ground upon which to dig new sinks, and upon digging almost anywhere in the space allotted to us former pits were encountered—some of them recent, some apparently dating back many years, as the contents were in some instances converted into a sort of adipocere. The flies, encouraged and nourished by all favoring conditions, were present everywhere and in everything in countless myriads, visiting alternately the kitchens and privy pits. I think that the flies constituted the most important factor in the spread of infection.

About the last of July our camp was moved to Tampa Heights. At this place we had more space than at the other camp and could locate the sinks to better advantage, but there were several extensive depressions where water collected and from which it could not by any possibility be drained. These stagnant pools swarmed with the larvæ of mosquitoes of a most vicious variety, and these were probably accountable for our malarial troubles. I frequently had to condemn the vegetables which were furnished us, the potatoes and onions often being decomposed and in a most offensive condition when the barrels were opened. The fresh meat was good; sometimes not. The so-called "canned roast beef"

was, I suspected, from the beef-extract factories, and was not appetizing. I frequently saw men vomit it several hours, sometimes the next day, after eating it, apparently untouched by the digestive fluids.

The regiment left Tampa August 18 and arrived at Huntsville August 21. The location of our camp at Huntsville was all that could be desired. The climate was healthful and the water was excellent. Here the condition of the men somewhat improved; nevertheless typhoid fever, diarrhea, and malaria prevailed to a considerable extent. We were not here long enough for the influence of the excellent climate and other conditions to produce a pronouncedly beneficial effect.

Major Jay, very properly in our opinion, objected to the transportation of those very sick with typhoid fever from Huntsville to Baltimore. He states that of eight men so desperately ill with typhoid fever at Huntsville that their removal by hospital train was not permitted, everyone recovered; while of the cases carried to Baltimore eight died. There can be no doubt that some of these were victims of the misdirected zeal of those instrumental in their removal, and that the loss of life would have been less had these men been allowed to remain at Huntsville. As a matter of fact it would have been much better had the entire regiment remained in camp at this place for a month longer, where recuperation would have been more rapid and whereby many cases of illness which occurred after the return of the men to Baltimore could have been averted. It was natural enough for the friends and the relatives of the soldiers to desire that they should come home, but a comprehensive view of the situation, including the best interests of the sick from a medical point of view, could not, of course, be expected of the friends at home.

Better counsel, however, might have been expected from some members of the medical profession who advised the bringing of these sufferers by a long, fatiguing journey from the excellent conditions prevailing at Huntsville to the sultry vitiated air of the city, where typhoid fever was already prevalent.

SECOND NEBRASKA VOLUNTEER INFANTRY.

Second Brigade, First Division, Third Army Corps.

This regiment reached Chickamauga Park, Ga., May 22, 1898. The first report is signed by Maj. M. A. Hoover, who makes the following statement:

The medical condition of the camp, outside of the diseases incident to and consequent upon the change of climate and water, has been excellent. Bowel troubles, such as diarrhea and dysentery, zymotic diseases, such as measles, and some cases of acute bronchitis and tonsillitis have been the prevailing troubles. An order has been issued that all drinking water be boiled. Cases of measles have been placed in isolated tents and a guard prevents all unnecessary communication with the rest of the command.

CONDENSED SICK REPORT FROM MAY 21 to 31, INCLUSIVE.

Mean strength	1,020
Dysentery	3
Diarrhea	80
Other diseases	31
Total	114

The June report is signed by Capt. M. A. Robert, who makes the following statement:

The medical condition of the command, outside of the diseases incident to and consequent upon the change of climate and water, has been excellent. Bowel troubles, such as diarrhea and dysentery, zymotic diseases, such as measles, and some colds and sore throats have been the prevailing troubles. Orders were issued to have all water used for drinking boiled.

CONDENSED SICK REPORT FOR JUNE.

Mean strength	1,133
Typhoid fever	1
Intermittent fever	2
Dysentery	4
Gastritis	1
Diarrhea	203
Other diseases	76
Total	287

In the July report Captain Robert makes the following statement:

The prevailing diseases are diarrhea and some dysentery, due to change of climate and water. All water for drinking is boiled previous to using, and all water for cooking is either boiled or filtered.

CONDENSED SICK REPORT FOR JULY.

Mean strength	1,317
Typhoid fever	6
Malarial fever	27
Enteritis	2
Gastro-enteritis	3
Dysentery	4
Gastritis	1
Diarrhea	160
Other diseases	64
Total	267

Major Hoover signs the August report and makes the following statement:

The prevailing diseases are malarial fever, remittent and intermittent, with complications of diarrhea and dysentery, due to poisonous emanations from infected soil in Chickamauga Park.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength	1,171
Typhoid fever	16
Malarial fever	115
Diarrhea	114
Gastro-enteritis	1
Gastritis	1
Enteritis	4
Dysentery	2
Other diseases	29
Total	282

There is no report from this regiment after August. The following is a list of the recognized and probable cases of typhoid fever:

- No. 1. Company E: Diarrhea, May 26; still sick July 31.
- No. 2. Company G: Diarrhea, June 9; still sick June 30.
- No. 3. Company E: Intermittent malaria. June 14; furloughed from division hospital August 29.

No. 4. Company A: Gastritis, June 15; furloughed from division hospital August 26.

No. 5. Company A: Intestinal colic, June 18; still sick June 30.

No. 6. Company A: Diarrhea, June 18; still sick August 31.

No. 7. Company C: Diarrhea, June 21; furloughed July 6.

No. 8. Company A: Diarrhea, June 26; still sick in hospital July 31.

No. 9. Company A: Diarrhea, June 28; still sick July 31.

No. 10. Company D: Typhoid fever, June 30; furloughed from division hospital August 26.

No. 11. Company H: Tertian malaria, July 2 to 17.

No. 12. Company E: Diarrhea, July 2; still sick July 31.

No. 13. Company D: Tertian malaria, July 3; still sick July 31.

No. 14. Company M: Diarrhea, July 5; still sick July 31.

No. 15. Company G: Typhoid fever, July 7; still sick August 31.

No. 16. Company E: Intermittent malaria, July 8; still sick July 31.

No. 17. Company E: Malaria, July 9; still sick July 31.

No. 18. Company B: Typhoid fever, July 11; still sick in quarters July 31.

No. 19. Company B: Typhoid fever, July 12; sent to Fort McPherson July 24.

No. 20. Company M: Quotidian malaria, July 12; furloughed August 11.

No. 21. Company F: Intermittent malaria, July 13; furloughed August 26.

No. 22. Company I: Intermittent malaria, July 14; still sick August 31.

No. 23. Company D: Dysentery, July 14; furloughed July 22.

No. 24. Company H: Quotidian malaria, July 16; still sick August 31.

No. 25. Company H: Quotidian malaria, July 16; furloughed August 26.

No. 26. Company H: Diarrhea, July 16; furloughed August 26.

No. 27. Company D: Quotidian malaria, July 16; furloughed August 24.

No. 28. Company B: Remittent malaria, July 17; still sick August 31.

No. 29. Company F: Intermittent malaria, July 17; furloughed August 26.

No. 30. Company M: Typhoid fever, July 20; furloughed August 24.

No. 31. Company E: Tertian malaria, July 22; still sick August 31.

No. 32. Company M: Remittent malaria, July 23; furloughed July 30.

No. 33. Company G: Tertian malaria, July 24; furloughed August 10.

No. 34. Company E: Typhoid fever, July 24; still sick August 31.

No. 35. Company L: Typhoid fever, July 24; furloughed August 24.

No. 36. Company E: Remittent malaria, July 24; still sick August 31.

No. 37. Company K: Quotidian malaria, July 24; still sick August 31.

No. 38. Company G: Remittent malaria, July 24; furloughed August 2.

No. 39. Company M: Typhoid fever, July 25; furloughed August 24.

No. 40. Company M: Typhoid fever, July 26; died in Leiter Hospital August 8.

No. 41. Company D: Quotidian malaria, July 29; furloughed from Sternberg Hospital September 9. In the hospital this case was diagnosed typhoid fever.

No. 42. Company I: Intermittent malaria, July 29; furloughed August 24.

No. 43. Company C: Remittent malaria, July 29; furloughed August 24.

No. 44. Company M: Typhoid fever, July 30 to August 23.

No. 45. Company K: Diarrhea, August 1; furloughed August 12.

No. 46. Company L: Remittent malaria, August 1; furloughed August 13. This man was a recent recruit.

No. 47. Company K: Quotidian malaria, August 1; furloughed from division hospital August 24. In the hospital this case was diagnosed typhoid fever.

No. 48. Company F: Diarrhea, August 1; furloughed from division hospital August 26.

No. 49. Company F: Quotidian malaria, August 1; furloughed from division hospital August 26. In hospital this case was diagnosed diarrhea.

No. 50. Company M: Enteritis, August 1; furloughed August 26.

No. 51. Company G: Diarrhea, August 1; furloughed from division hospital August 13. In the hospital this case was diagnosed remittent malaria.

No. 52. Company D: Remittent malaria, August 1; furloughed from division hospital August 26. In the hospital this case was diagnosed typhoid fever.

No. 53. Company I: Remittent malaria, August 1; furloughed August 26.

No. 54. Company A: Tertian malaria, August 1; furloughed from division hospital August 29. In the hospital this case was diagnosed remittent malaria.

No. 55. Company H: Diarrhea, August 1; furloughed August 26.

No. 56. Company H: Diarrhea, August 1; still sick in hospital August 31.

No. 57. Company H: Remittent malaria, August 1; furloughed August 30.

No. 58. Company M: Typhoid fever, August 1; furloughed August 21.

No. 59. Company M: Typhoid fever, August 2; furloughed August 24.

No. 60. Company F: Remittent malaria, August 2; furloughed August 26.

No. 61. Company B: Remittent malaria, August 2; furloughed August 29.

No. 62. Company K: Remittent malaria, August 2; furloughed August 22.

No. 63. Company E: Intermittent malaria, August 3; furloughed August 26.

No. 64. Company M: Quotidian malaria, August 3; still sick August 31.

No. 65. Company F: Remittent malaria, August 3; furloughed August 26.

No. 66. Company G: Quotidian malaria, August 3; furloughed August 26.

No. 67. Company B: Enteritis, August 4; furloughed August 26.

No. 68. Company G: Quotidian malaria, August 4; still sick August 31.

No. 69. Company L: Quotidian malaria, August 4; furloughed August 26.

No. 70. Company H: Enteritis, August 5; furloughed August 29.

No. 71. Company H: Typhoid fever, August 5; furloughed August 24.

No. 72. Company G: Remittent malaria, August 5; furloughed August 24.

No. 73. Company G: Remittent malaria, August 6; still sick August 31.

No. 74. Company B: Remittent malaria, August 6; furloughed August 26.

No. 75. Company F: Quotidian malaria, August 6; furloughed August 24.

No. 76. Company G: Remittent malaria, August 6; furloughed August 18.

No. 77. Company L: Remittent malaria, August 7; furloughed August 26. This man is recorded as having had dysentery June 14 to 28 and again July 10 to 16.

No. 78. Company G: Quotidian malaria, August 7; furloughed August 26.

No. 79. Company G: Intermittent malaria, August 7; furloughed August 14.

No. 80. Company K: Quotidian malaria, August 7; furloughed August 16.

No. 81. Company G: Remittent malaria, August 7; furloughed August 28.

No. 82. Company E: Typhoid fever, August 7; died in Sternberg Hospital September 19.

No. 83. Company M: Remittent malaria, August 8; furloughed August 26.

No. 84. Company A: Quotidian malaria, August 8; died in Leiter Hospital September 17.

No. 85. Company K: Remittent malaria, August 9; furloughed August 26.

No. 86. Company M: Remittent malaria, August 9; furloughed August 26.

No. 87. Company M: Diarrhea, August 9; furloughed August 27. In hospital this case was diagnosed typhoid fever.

No. 88. Company D: Enteritis, August 10; furloughed August 29. In hospital this case was diagnosed typhoid fever.

No. 89. Company E: Remittent malaria, August 10; furloughed August 20.

No. 90. Company M: Remittent malaria, August 10; furloughed August 22.

No. 91. Company M: Quotidian malaria, August 11; furloughed August 22.

No. 92. Company B: Quotidian malaria, August 11; furloughed August 18.

No. 93. Company B: Remittent malaria, August 11; furloughed August 26.

No. 94. Company M: Quotidian malaria, August 11; furloughed August 26.

No. 95. Company M: Quotidian malaria, August 12; still sick August 31.

No. 96. Company G: Quotidian malaria, August 12; furloughed from Leiter Hospital September 30. In hospital this case was diagnosed typhoid fever.

No. 97. Company I: Dysentery, August 12; furloughed from division hospital August 27. In hospital this case was diagnosed remittent malaria.

No. 98. Company C: Quotidian malaria, August 12; furloughed from Leiter Hospital August 26. In hospital this case was diagnosed typhoid fever.

No. 99. Band: Typhoid fever, August 13; furloughed August 24.

No. 100. Company E: Typhoid fever, August 13; died in division hospital August 18.

No. 101. Company I: Quotidian malaria, August 13; still sick in Leiter Hospital August 31. In hospital this case was diagnosed typhoid fever.

No. 102. Company A: Remittent malaria, August 13; furloughed August 22.

No. 103. Company G: Quotidian malaria, August 14; furloughed August 29.

No. 104. Company G: Quotidian malaria, August 14; furloughed August 26.

No. 105. Company K: Quotidian malaria, August 14; furloughed August 18.

No. 106. Company A: Typhoid fever, August 14; furloughed August 26.

No. 107. Company L: Remittent malaria, August 14; furloughed from division hospital September 30. In hospital this case was diagnosed typhoid fever.

No. 108. Company E: Quotidian malaria, August 15; furloughed August 29.

No. 109. Company E: Remittent malaria, August 15; furloughed from Leiter Hospital September 15. In hospital this case was diagnosed typhoid fever.

No. 110. Company E: Typhoid fever, August 15; still sick in division hospital September 30.

No. 111. Company I: Quotidian malaria, August 15; furloughed August 29.

No. 112. Company C: Quotidian malaria, August 15; furloughed August 26.

No. 113. Company M: Quotidian malaria, August 15; furloughed from division hospital August 28. In hospital this case was diagnosed typhoid fever.

No. 114. Company D: Quotidian malaria, August 15; furloughed August 24.

No. 115. Company not given: Remittent malaria, August 15; furloughed August 24.

No. 116. Company G: Quotidian malaria, August 15; furloughed from Leiter Hospital August 22. In hospital this case was diagnosed typhoid fever.

No. 117. Company A: Diarrhea, August 16; furloughed August 24.

No. 118. Company E: Typhoid fever, August 16; still sick in Sternburg hospital August 31.

No. 119. Company H: Diarrhea, August 16; furloughed August 24.

No. 120. Company A: Diarrhea, August 16; furloughed August 24.

No. 121. Company G: Remittent malaria, August 16; furloughed August 26.

No. 122. Company E: Typhoid fever, August 16; furloughed from Leiter Hospital September 30.

No. 123. Company E: Typhoid fever, August 17; furloughed August 21.

No. 124. Company B: Typhoid fever, August 17; furloughed August 29.

No. 125. Company G: Quotidian malaria, August 17; furloughed August 29.

No. 126. Company D: Diarrhea, August 18; furloughed August 23.

No. 127. Company K: Quotidian malaria, August 18; furloughed August 29.

No. 128. Band: Quotidian malaria, August 19; furloughed August 26.

No. 129. Band: Quotidian malaria, August 19; furloughed August 29.

No. 130. Company A: Remittent malaria, August 19; furloughed August 23.

No. 131. Company G: Typhoid fever, August 20; furloughed August 22.

No. 132. Company A: Typhoid fever, August 20; furloughed August 22.

No. 133. Company E: Diarrhea, August 20; furloughed August 24.

No. 134. Company C: Quotidian malaria, August 20; furloughed August 29.

No. 135. Company M: Remittent malaria, August 20; furloughed from Leiter Hospital September 30. In hospital this case was diagnosed typhoid fever.

No. 136. Company G: Quotidian malaria, August 20; furloughed from division hospital September 19. In hospital this case was diagnosed typhoid fever.

No. 137. Company M: Remittent malaria, August 20; furloughed August 22.

No. 138. Company K: Quotidian malaria, August 20; furloughed August 29.

No. 139. Company E: Quotidian malaria, August 20; furloughed August 29.

No. 140. Company G: Typhoid fever, August 20; still sick in Leiter Hospital August 31.

No. 141. Company A: Diarrhea, August 20; furloughed August 26.

No. 142. Company E: Diarrhea, August 20; furloughed August 30.

No. 143. Company E: Typhoid fever, August 20; furloughed September 8.

No. 144. Company K: Remittent malaria, August 20; furloughed August 29.

- No. 145. Company K: Quotidian malaria, August 21; still sick August 31.
- No. 146. Company K: Quotidian malaria, August 21; furloughed August 29.
- No. 147. Company K: Quotidian malaria, August 22; furloughed August 29.
- No. 148. Company D: Quotidian malaria, August 23; furloughed August 29.
- No. 149. Company B: Typhoid fever, August 23; furloughed from Leiter Hospital September 17.
- No. 150. Company K: Typhoid fever, August 23; still sick in Leiter Hospital August 31.
- No. 151. Company K: Quotidian malaria, August 23; furloughed August 29.
- No. 152. Company B: Typhoid fever, August 23; furloughed from division hospital September 30.
- No. 153. Company G: Typhoid fever August 23; furloughed from Leiter Hospital September 27.
- No. 154. Company E: Diarrhea, August 23; furloughed August 29.
- No. 155. Company B: Typhoid fever, August 25; furloughed August 29.
- No. 156. Company G: Quotidian malaria, August 25; furloughed from division hospital August 28. In hospital this case was diagnosed typhoid fever.
- No. 157. Company A: Typhoid fever, August 25; furloughed August 29.
- No. 158. Company L: Quotidian malaria, August 25; furloughed from division hospital August 29. In hospital this case was diagnosed typhoid fever.
- No. 159. Company K: Typhoid fever, August 26; furloughed August 29. On the record this man is reported for duty, but this must be a mistake.
- No. 160. Company G: Quotidian malaria, August 26; furloughed August 30.
- No. 161. Company E: Typhoid fever, August 27; furloughed August 29.
- No. 162. Company B: Quotidian malaria, August 28; furloughed from Leiter Hospital October 4. In hospital this case was diagnosed typhoid fever.
- No. 163. Company K: Typhoid fever, August 29; furloughed August 29.
- No. 164. Company A: Typhoid fever, August 30; furloughed from Sternberg Hospital October 15.
- No. 165. Company E: Typhoid fever, August 30; died in Sternberg Hospital September 11.
- No. 166. Company E: Typhoid fever, August 30; furloughed from Sternberg Hospital September 15.
- No. 167. Company E: Typhoid fever, August 31; furloughed from Sternberg Hospital September 9.

SUMMARY.

Assembled at Camp Alvin Saunders, Lincoln, Nebr., April 27, 1898.

Mustered into United States service May 10, 1898.

Arrived at Chickamauga Park, Ga., May 22, 1898.

Strength on arrival, 1,020.

Date of first case of probable typhoid fever, May 26, 1898.

Date of first case of recognized typhoid fever, June 30, 1898.

Left Chickamauga Park, Ga., August 31, 1898.

Strength on departure, 1,303.

Number of cases of probable typhoid fever developed at Chickamauga 167

The record of this regiment stops with its leaving Chickamauga Park, Ga.

Total number of cases of probable typhoid fever developed in the Second Nebraska Volunteer Infantry from May to August, 1898 167

H. Doc. 757, 58-2—12

These 167 cases were diagnosed as follows:

Typhoid fever.....	56
Malaria.....	82
Diarrhea.....	23
Enteritis.....	3
Gastritis.....	1
Intestinal colic.....	1
Dysentery.....	1
Total.....	167

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Brown, Harry E.....	Pvt., E.	1898. Sept. 11	Chickamauga, Ga.	Typhoid; acute hepatitis.
Burt, Oliver W.....	Pvt., K.	Oct. 8	Clay Center, Nebr.	Typhoid.

Total deaths..... 26

Deaths due to typhoid fever..... 22

Percentage of deaths among probable cases (167) of typhoid fever, 13.17.

Percentage of deaths among recognized cases (56) of typhoid fever, 39.28.

It will be seen from these figures that it is not at all likely that we have obtained the full list of cases of typhoid fever.

Major Hoover states:

Second Nebraska National Guard assembled at Camp Alvin Saunders, Lincoln, Nebr., April 27, 1898. The weather was intensely cold and wet until May 8, and developed over 200 cases of acute tonsillitis, and more than 50 cases of diarrhea; about 30 cases of measles were reported while here. The above-named cases were taken from First and Second regiments, Nebraska National Guard. I was the only surgeon in charge. The cases of measles were in isolated tents and quarantined. The others rallied quickly, so that by May 10, the date of mustering into the United States service as volunteers, the majority had been assigned to duty. We were transferred to Chickamauga Park, Ga., arriving there May 22, being two days en route. We were assigned to the First Division, Second Brigade, Third Army Corps. Our camp was heavy with foliage and undergrowth, but was soon cleared and kept thoroughly policed during our stay. The main supply of water was from Chickamauga Creek, and after a couple of weeks iron pipes were laid on the surface and water carried by this means to the various camps, and often it was so hot that the horses would not drink it. Orders were given to have all water boiled that was used for drinking purposes, and later on a system of filtering the water was adopted, which proved a failure, as the amount of solid refuse was

so great as to render the filters useless. Part of the water was carried from Crawfish Springs, which was undoubtedly pure at first, but later became unfit for drinking. Then water was brought from Blue Springs. A small lake formed where the water was taken, and this was frequently contaminated by hogs, cattle, and mules wading, wallowing, and standing in same, but it was the best we had or could get. The water supply—i. e., good, pure water—was inadequate to the demand and very difficult to procure, and undoubtedly this was an important factor in the causation of typhoid fever and dysenteries.

The first month in camp our regiment was in good condition. A few cases of measles and diarrhea were all that answered to sick call. From about the 1st of July malaria in various degrees manifested itself with intermittent and remittent fevers, some of a pernicious type, simulating, in some respects, symptoms of typhoid, and in a great many instances were called typhoid.

Being assigned to command First Division, Third Army Corps Hospital June 1, and not returned to regiment until August 30, I can only report on cases received in same. About July 1 the first pronounced case of typhoid fever was received, where we had the characteristic lesion, and from then until our leaving camp quite a number of cases were received, but did not assume alarming proportions in comparison with malarial cases. Microscopical examinations of the blood were made in a number of suspected cases, and in a few instances showed characteristic lesions of typhoid. In every case of typhoid fever received in hospital during my command we had the eruptions plainly shown, in some cases the spots being very numerous and extending from pubes to the upper margin of the stomach. Delirium was manifest in all cases; but in the majority, of a mild form. Tympanites, subsultus tendinum, and pea-green stools were present in all cases, as was excessive thirst and occasional vomiting. Only in cases of intestinal hemorrhage did the patients die, all others recovering, the convalescing extending from two to five weeks. The death rate of typhoid fever in our hospital was very small, our greatest mortality occurring after returning to Fort Omaha, Nebr., where we arrived September 1 and remained until mustered out October 24. Our camp at Omaha was a good one from every standpoint, but the weather was cold and damp, and a great many cases developed.

The symptoms in these cases were about the same, and all died who had hemorrhages. A great many cases (so-called typhoid) were reported, but recovery took place in from three to four weeks, and in many instances these were cases of pernicious intermittent and remittent fevers, malaria, and jaundice, all with some pronounced symptoms of typhoid, but not the typhoid lesion. You will see from report of deaths, 20 were from pronounced typhoid, the other 8 from various causes. There were numerous factors that entered into the spread of this fever in the Georgia camp, some might have been averted entirely, some modified by change of camp early in the summer, but the main cause of same (the water supply) was a difficult one and could not be overcome except by removal of troops to some other camp. The number of cases treated from September 1 to October 24, inclusive, approximated about 200, of which number about 40 cases were of typhoid fever, and 8 deaths resulted from same. I am not sure as to whether it is 5 or 8 deaths from typhoid, as I have not the records. Some died after the regiment was mustered out, and no report was ever made to me of same after October 24.

COMMENT.

Major Hoover has sent us a corrected list of deaths in which the total number is the same, but he has changed the causes of death in several instances and, according to him, only 20 cases instead of 24 died of typhoid fever. He says that Harry Brown, of Company E, died of acute hepatitis. The records of Stern-

berg Hospital show that this man died of typhoid fever. He was received at Sternberg Hospital without regimental diagnosis August 30 and died September 11. Major Hoover reports that Chris Kyris died of heart lesion. It will be seen that this man died at Norfolk, Nebr., and the attending physician reported his death as due to typhoid fever. Major Hoover reports N. G. Wiggins as having died of appendicitis. The records of the hospital at Fort Crook report him as having died of typhoid fever.

SECOND NEW YORK VOLUNTEER INFANTRY.

Second Brigade, First Division, Third Army Corps.

This regiment was at Chickamauga Park, Ga., for only twelve days. It reached Chickamauga May 21 and departed June 1. From Chickamauga it went to Tampa, Fla., and became a part of the Second Brigade of the Second Division of the Fourth Army Corps.

The first report that we have of this regiment is for the month of June, and is signed by Asst. Surg. Henry C. Baum, who makes no comment.

CONDENSED SICK REPORT FOR JUNE.

Mean strength.....	1,078
Typhoid fever.....	2
Indigestion.....	3
Gastritis.....	1
Undiagnosed.....	10
Malaria.....	1
Diarrhea.....	231
Injured by lightning.....	10
Other diseases and accidents.....	53
Total.....	311

The July report is also signed by Asst. Surg. Henry C. Baum without comment.

CONDENSED SICK REPORT FOR JULY.

Mean strength, not given.	
Typhoid fever.....	2
Malarial fever.....	19
Diarrhea.....	242
Other diseases and accidents.....	197
Total.....	460

The exact location of this regiment at Tampa is not given in any of the reports. It is stated that the sick were sent to the hospital at Tampa Heights.

In the August report Louis Balch, major and surgeon, makes the following statement:

The command moved from Tampa, Fla., to Fernandina, Fla., the latter part of July. The camp ground was much better and more healthy than the one at Tampa, but sickness still kept up to an alarming extent. Part of this, I think, may be attributed to the fact that the command had fallen into a highly nervous state, the presence of so many sick men in camp acting on the well as an exciting cause. Being retained in the fever belt had also its effect.

August 24 the command was ordered north to Troy, N. Y., and reached that place August 27, going into camp on the 28th and 29th at Averill Park, 12 miles out from Troy, on high rolling ground

about 800 to 900 feet above sea level. Here rapid improvement took place and while malaria still developed it was much less in amount. All cases requiring hospital treatment were removed to the hospitals in the city and the effect upon the command of not seeing so many sick crawling or lying about camp was marked. Catarrh and jaundice began to develop. Twelve cases died during the month; only two of these are noted in the text, the other deaths taking place at hospitals or at home.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength	1,358
Typhoid fever.....	2
Malaria and malarial fever	258
Diarrhea	206
Constipation	22
Indigestion	26
Biliousness.....	2
Gastro-enteritis.....	1
Catarrh of stomach	2
Undiagnosed	20
Other diseases.....	153
Total	692

During the month of August 90 patients were transferred to the hospital.

The September report is signed by Major Balch, who makes the following statement:

Camp Hardin, at Averill Park, was on high ground, the camp being pitched on the crown of a knoll. The soil was a gravelly clay, water not sinking in rapidly after rain, but slowly evaporating, absorbing, or running off as the situation allowed.

Water taken from a stand pipe from Sand Lake was of good quality, having, however, a slight peaty taste. It was clear and clean. No chemical or biological examination of it was made. Nine more men were sent to hospital than appear upon this report. This may be partly accounted for by the fact that on the arrival of the regiment in Troy cases were at once sent to hospital, and as books and papers did not reach Camp Hardin until some days after the command (headquarters baggage car being lost in North Carolina), no record appears to have been properly kept of these cases.

Many men were allowed to go home on passess, being ill, and all record of them was lost. The deaths reported in summary are the number reported from hospitals and homes. Eight deaths were reported in October, making the total loss by death to the regiment 35.

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength	1,346
Typhoid fever.....	2
Malaria	28
Undiagnosed.....	5
Gastritis	3
Constipation	4
Diarrhea.....	34
Debility	2
Indigestion	5
Colitis	1
Other diseases.....	47
Total	131

The following is a list of the recognized and probable typhoid cases in this regiment. It should be stated, however, that in all probability this list is quite incomplete. This point will be discussed later:

No. 1. Company H: Intermittent malaria, June 1 to 12.

No. 2. Company M: Typhoid fever, June 11 to July 26.

No. 3. Company A: Diarrhea, June 13; still sick June 30.

No. 4. Hospital Corps: Typhoid fever, June 24; sent to Fort McPherson June 30.

No. 5. Company not given: Malaria, July 2; sent to division hospital August 8.

No. 6. Company G: Diarrhea, July 5 to 20.

No. 7. Company M: Malaria, July 9 to August 8.

No. 8. Company D: Typhoid fever, July 10; sent to hospital July 14.

No. 9. Company M: Typhoid fever, July 10; sent to hospital July 14.

No. 10. Company M: Malaria, July 12; sent to division hospital August 9.

No. 11. Company G: Malaria, July 13; sent to hospital at Tampa Heights July 13. There is no evidence that this man was ever returned to duty.

No. 12. Company D: Typhoid fever, July 14; died at Fort McPherson July 19.

No. 13. Company I: Malaria, July 16; sent to Fort Thomas July 18. Here the diagnosis was changed to typhoid fever and the patient was discharged October 5.

No. 14. Company M: Malaria, July 16; sent to Third Division Hospital, Fernandina, August 9. Here the disease was diagnosed typhoid fever and the patient was furloughed September 13.

No. 15. Company M: Malaria, July 17; sent to Fort Thomas July 22; transferred to Third Division Hospital August 9; furloughed September 10. At Fort Thomas this case was diagnosed typhoid fever.

No. 16. Company M: Typhoid fever, July 17; sent to division hospital at Fernandina August 9.

No. 17. Company M: Diarrhea and malaria, July 17; sent to division hospital at Fernandina August 9. Here the disease was diagnosed typhoid fever and the patient was furloughed August 17.

No. 18. Company K: Malaria, July 19; sent to hospital at Tampa Heights July 25; further disposition of this patient is not given.

No. 19. Company I: Malaria, July 19 to August 10.

No. 20. Company I: Malaria, July 19 to August 4.

No. 21. Company K: Diarrhea, July 19; sent to Fort Thomas July 29. Here the disease was diagnosed typhoid fever and the patient was furloughed August 28.

No. 22. Company I: Malaria, July 19; sent to Fort McPherson August 10. Here the disease was diagnosed typhoid fever. Further disposition not given.

No. 23. Company M: Malaria, July 19 to August 21.

No. 24. Company L: Malaria, July 20; sent to Fort McPherson July 21. Further disposition not given.

No. 25. Company H: Malaria, July 20; still sick in hospital at Tampa Heights July 31.

No. 26. Company not given: Malaria, July 20; died in regimental hospital at Fernandina July 31.

No. 27. Company F: Typhoid fever, July 22; furloughed July 26.

No. 28. Company M: Sent to hospital without date or diagnosis July 22. In hospital the case was diagnosed typhoid fever and the patient was furloughed August 6.

No. 29. Company M: Without date or diagnosis; sent to hospital July 22. Here the disease was diagnosed typhoid fever, and the patient was furloughed August 25.

No. 30. Company D: Malaria, July 22; still sick at Fort Thomas July 31.

No. 31. Company M: Without date or diagnosis; sent to Fort Thomas July 22. Here the disease was diagnosed typhoid fever, and the patient was furloughed August 18.

No. 32. Company E: Malaria, July 23; still sick in division hospital July 31.

No. 33. Company K: Malaria, July 23; sent to hospital July 24; transferred to Fort Thomas July 29; furloughed September 21.

No. 34. Company H: Malaria, July 25; sent to Second Division Hospital at Fernandina July 28; further disposition is not given.

It might be remarked here that all of the records of the division hospital at Fernandina were destroyed in a storm.

No. 35. Company M: Malaria, July 26; sent to Third Division Hospital at Fernandina August 9.

No. 36. Company D: Malaria, July 27; sent to Third Division Hospital at Fernandina July 30.

No. 37. Company I: Malaria, July 28; sent to hospital at Troy August 28.

No. 38. Company M: Typhoid fever, July 28; sent to division hospital at Fernandina July 30; transferred to Fort Thomas August 20; furloughed September 13.

No. 39. Company L: Malaria, July 29; sent to Third Division Hospital at Fernandina August 1.

No. 40. Company C: Malaria, July 29; sent to division hospital at Fernandina August 7.

No. 41. Company C: Malaria, July 29; furloughed August 17.

No. 42. Company L: Malaria, July 29; still sick at Fernandina August 31.

No. 43. Company K: Diarrhea, July 29; still sick August 14.

No. 44. Company D: Malaria, July 29; furloughed September 9.

No. 45. Company I: Malaria, July 29; furloughed September 9.

No. 46. Company I: Malaria, July 30; sent to Fort McPherson August 1. Here the disease was diagnosed typhoid fever, and the further disposition of this patient is not given.

No. 47. Company D: Malaria, July 30; died at Fort McPherson August 8.

No. 48. Company L: Malaria, July 30; died at Fernandina July 31.

No. 49. Company H: Malaria, July 31; still sick August 31.

No. 50. Company L: Typhoid fever, July 31; furloughed August 7.

No. 51. Company F: Typhoid fever, July 31; sent home on train August 7.

No. 52. Company K: Malaria, July 31; still sick at Fernandina August 31.

No. 53. Company D: Typhoid fever, July 31; furloughed without date.

No. 54. Company H: Malaria, July 31; furloughed August 10.

No. 55. Company D: Malaria, July 31; furloughed August 10.

No. 56. Company I: Malaria, July 31; discharged from hospital October 14.

No. 57. Company C: Malaria, August 1; still sick at Fernandina August 31.

No. 58. Company I: Malaria, August 1; still sick at home August 31.

No. 59. Company F: Diarrhea, August 1; furloughed August 15.

No. 60. Company C: Diarrhea, August 1; still sick at Fernandina August 31.

No. 61. Company C: Continued fever, August 1; furloughed August 25.

No. 62. Company I: Malaria, August 1; sent to Fort Thomas August 10. Here the disease was diagnosed typhoid fever, and the patient was discharged October 14.

No. 63. Company A: Malaria, August 2; sent to Fort McPherson August 8.

No. 64. Company L: Malaria, August 2; still sick at Fernandina August 31.

No. 65. Company K: Malaria, August 2; still sick at Fernandina August 31.

No. 66. Company M: Typhoid fever, August 3; died August 9.

No. 67. Company L: Malaria, August 3; still sick at Fernandina August 31.

No. 68. Company C: Malaria, August 3; sent to Fort McPherson August 10.

No. 69. Company E: Malaria, August 3; still sick at Fernandina August 31.

No. 70. Company B: Malaria, August 4; still sick at Fernandina August 31.

No. 71. Company L: Malaria, August 4; still sick at Fernandina August 31.

No. 72. Company M: Continued fever, August 5; furloughed September 7.

No. 73. Company I: Malaria, August 5; still sick at Fernandina August 31.

No. 74. Company K: Diarrhea, August 5; furloughed August 17.

No. 75. Company M: Malaria, August 6; still sick at Fernandina August 31.

No. 76. Company M: Malaria, August 6; furloughed August 23.

No. 77. Company K: Malaria, August 6; still sick at Fernandina August 31.

No. 78. Company A: Diarrhea, August 6; still sick at home August 31.

No. 79. Company A: Typhoid fever, August 6; furloughed August 13.

No. 80. Company B: Typhoid fever, August 7; disposition not given.

No. 81. Company B: Malaria, August 7; still sick in hospital August 31.

No. 82. Company D: Malaria, August 8; still sick at Fernandina August 31.

No. 83. Company K: Malaria, August 8; still sick at Fernandina August 31.

No. 84. Company D: Malaria, August 8; still sick at Fernandina August 31.

No. 85. Company C: Malaria, August 8; still sick at Fernandina August 31.

No. 86. Company E: Malaria, August 8; still sick at Fernandina August 31.

No. 87. Company H: Malaria, August 8; still sick at Fernandina August 31.

No. 88. Company C: Malaria, August 8; still sick at Convent Hospital, Fernandina August 31.

No. 89. Company D: Malaria, August 8; still sick at Fernandina August 31.

No. 90. Company K: Malaria, August 9; still sick at Fernandina August 31.

No. 91. Company L: Malaria, August 9; sent to division hospital at Fernandina August 14.

No. 92. Company D: Malaria, August 10; sent to division hospital at Fernandina August 13.

No. 93. Company L: Malaria, August 10; sent to division hospital at Fernandina August 20.

No. 94. Company L: Diarrhea, August 11; still sick at Fernandina August 31.

No. 95. Company C: Diarrhea, August 11; furloughed August 23.

No. 96. Company H: Malaria, August 11; sent to hospital at Fernandina August 16.

No. 97. Company H: Diarrhea, August 11; sent to hospital at Fernandina August 15; transferred to Fort Thomas August 20. Here the disease was diagnosed typhoid fever, and the patient was discharged October 14.

No. 98. Company K: Malaria, August 12; sent to division hospital at Fernandina August 15.

No. 99. Company F: Malaria, August 12; sent to division hospital at Fernandina August 15.

No. 100. Company F: Malaria, August 13; sent to division hospital at Fernandina August 15.

No. 101. Company F: Malaria, August 13; furloughed August 25.

No. 102. Company L: Malaria, August 13; sent to division hospital at Fernandina August 20.

No. 103. Company E: Undiagnosed, August 13; furloughed August 23.

No. 104. Company F: Diarrhea, August 13; furloughed August 25.

No. 105. Company A: Malaria, August 13; died at home August 27.

No. 106. Company F: Diarrhea, August 13; furloughed August 23.

No. 107. Company F: Malaria, August 13; sent to division hospital August 15; transferred to Fort Thomas August 20. Here the disease was diagnosed typhoid fever, and the patient was discharged October 14.

No. 108. Company D: Malaria, August 14; sent to division hospital at Fernandina August 16.

No. 109. Company K: Malaria, August 14; sent to division hospital at Fernandina August 15. There is no record that any of these cases were ever returned to duty.

No. 110. Company I: Malaria, August 14; still sick at home August 31.

No. 111. Company D: Malaria, August 14; sent to division hospital at Fernandina August 22.

No. 112. Company I: Malaria, August 15; sent to division hospital at Fernandina August 24.

No. 113. Company A: Malaria, August 15; furloughed August 18.

No. 114. Company E: Malaria, August 15; sent to division hospital at Fernandina August 28.

No. 115. Company D: Malaria, August 15; sent to division hospital at Fernandina August 16.

No. 116. Company H: Malaria, August 15; sent to division hospital at Fernandina August 16.

No. 117. Company H: Diarrhea, August 15; sent to division hospital at Fernandina August 17.

No. 118. Company M: Malaria, August 16; sent to division hospital at Fernandina August 21.

No. 119. Company L: Malaria, August 16; sent to division hospital at Fernandina without date.

No. 120. Company I: Diarrhea, August 17; furloughed August 31.

No. 121. Company I: Malaria, August 17; furloughed August 30.

No. 122. Company L: Malaria, August 18; sent to division hospital at Fernandina.

No. 123. Company I: Malaria, August 18; sent to division hospital at Fernandina August 24.

No. 124. Company M: Malaria, without date; sent to Fort Thomas August 20. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 20.

No. 125. Company M: Malaria, without date; sent to Fort Thomas August 20. Here the disease was diagnosed typhoid fever, and the patient was furloughed without date.

No. 126. Company D: Diarrhea, August 20; furloughed without date.

No. 127. Company A: Malaria, August 20; sent to division hospital at Fernandina August 24.

No. 128. Company D: Malaria, August 20; sent to Fort Thomas September 3. Here the disease was diagnosed typhoid fever, and the patient was discharged October 19.

No. 129. Company D: Malaria, August 20; furloughed without date.

No. 130. Company not given: Malaria, August 20; furloughed August 27.

No. 131. Company L: Malaria, August 20; sent to hospital at Troy August 28.

No. 132. Company E: Malaria, August 20; sent to division hospital at Fernandina August 23.

No. 133. Company L: Malaria, August 20; sent to division hospital at Fernandina August 24.

No. 134. Company L: Without date or diagnosis; sent to Fort Thomas August 20. Here the disease was diagnosed typhoid fever, and the patient was discharged October 9.

No. 135. Company A: Malaria, August 20; sent to division hospital at Fernandina August 24.

No. 136. Company D: Without date or diagnosis; sent to Fort Thomas August 20. Here the disease was diagnosed typhoid fever, and the patient was discharged October 18.

No. 137. Company F: Malaria, August 21; sent to hospital at Troy August 30.

No. 138. Company I: Malaria, August 21; furloughed August 31.

No. 139. Company A: Malaria, August 23; sent to hospital at Troy August 27.

No. 140. Company E: Continued fever, August 24; furloughed September 20.

No. 141. Company I: Malaria, August 29; still sick at home September 30.

No. 142. Company I: Malaria, August 29; still sick at home September 30.

No. 143. Company I: Malaria, August 29; sent to hospital at Troy August 31.

No. 144. Company C: Typhoid fever, September 1; sent to hospital at Troy September 3.

No. 145. Company D: Typhoid fever, September 5; disposition not given.

No. 146. Company I: Malaria, September 7; sent to hospital at Troy September 13.

No. 147. Staff: Malaria, September 7; sent to hospital at Troy September 10.

No. 148. Company I: Malaria, September 7; sent to Fort Thomas September 7. Here the disease was diagnosed typhoid fever and the patient was discharged October 29.

No. 149. Company K: Without date or diagnosis; sent to Fort Thomas September 7. Here the disease was diagnosed typhoid fever and the patient was discharged October 29.

No. 150. Company I: Without date or diagnosis; sent to Fort Thomas September 7. Here the disease was diagnosed typhoid fever and the patient was discharged October 14.

No. 151. Company M: Without date or diagnosis; sent to Fort Thomas September 7. Here the disease was diagnosed typhoid fever and the patient was discharged October 19.

No. 152. Company K: Without date or diagnosis; sent to Fort Thomas September 7. Here the disease was diagnosed typhoid fever and the patient was discharged October 14.

No. 153. Company D: Without date or diagnosis; sent to Fort Thomas September 7. Here the disease was diagnosed typhoid fever and the patient was discharged November 3.

No. 154. Company H: Without date or diagnosis; sent to Fort Thomas September 7. Here the disease was diagnosed malaria and the patient was discharged October 14.

No. 155. Company K: Without date or diagnosis; sent to Fort Thomas September 7. Here the disease was diagnosed typhoid fever and the patient was discharged October 14.

No. 156. Company H: Without date or diagnosis; sent to Fort Thomas September 7. Here the disease was diagnosed malaria and the patient was discharged October 14.

No. 157. Company D: Typhoid fever, September 28; died October 3.

No. 158. Company M: Typhoid fever, September 28; furloughed September 30.

No. 159. Company F: Typhoid fever, September 28; furloughed October 1.

No. 160. Company D: Typhoid fever, September 28; furloughed October 23.

No. 161. Company E: Typhoid fever, September 28; furloughed September 30.

SUMMARY.

Assembled at Peeskill.

Mustered into United States service May 8, 1898.

Arrived at Chickamauga Park, Ga., May 21, 1898.

Strength on arrival, 1,078.

Date of first case of probable typhoid fever, June 1, 1898.

Date of first case of recognized typhoid fever, June 11, 1898.

Left Chickamauga Park, Ga., June 1, 1898.

Strength on departure, 1,014.

Number of cases of probable typhoid fever developed at Chickamauga..... 1

Arrived at Tampa, Fla., about June 3, 1898.

Left Tampa, Fla., about July 20, 1898.

Number of cases of probable typhoid fever developed at Tampa, Fla..... 24

Arrived at Fernandina, Fla., about July 20, 1898.

Left Fernandina, Fla., August 24, 1898.

Number of cases of probable typhoid fever developed at Fernandina, Fla.....	115
Arrived at Troy, N. Y., August 27, 1898.	
Number of cases of probable typhoid fever developed after reaching Troy, N. Y.....	21
Total number of cases of probable typhoid fever developed in the Second New York Volunteer Infantry, from May to September, 1898.....	161
These 161 cases were diagnosed as follows:	
Typhoid fever.....	46
Malaria.....	98
Continued fever.....	3
Diarrhea.....	13
Undiagnosed.....	1
Total.....	161

The following is an alphabetical list of total deaths in this regiment, so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
1898.				
Allen, Charles W.....	Pvt., M	Aug. 9	Fort McPherson, Ga.	Typhoid.
Bahme, Felix W.....	Pvt., D	Sept. 1	Fernandina, Fla.....	Do.
Baker, Charles N.....	Pvt., C	Aug. 9	Atlanta, Ga.....	Do.
Blakely, Andrew W.....	Pvt., D	Oct. 22	Fort McPherson, Ga.	Do.
Chapel, Herbert S.....	Pvt., M	Sept. 9	Fernandina, Fla.....	Do.
Daniels, Frank H.....	Pvt., E	Oct. 1	Pneumonia.
Dewey, Frank.....	Pvt., D	Sept. 7	Fernandina, Fla.....	Typhoid.
Hayner, Horatio H.....	Corpl., A	Sept. 20	Troy, N. Y.....	Do.
Holden, James A.....	Pvt., L	Sept. 13do.....	Do.
Jessup, F. W.....	Pvt., D	Sept. 27do.....	Do.
Jourdan, Elmer J.....	Pvt., L	Aug. 16	Fort McPherson, Ga.	Do.
Kennedy, W. S.....	Pvt., A	Aug. 28	Troy, N. Y.....	Do.
Legnard, Frank S.....	Pvt., L	July 31	Fernandina, Fla.....	(Typhoid); convulsions.
MacArthur, W. H.....	Pvt., A	Aug. 18do.....	Intestinal hemorrhage, resulting from typhoid.
McNair, F. P.....	Corpl., L	Oct. 18	Saratoga Springs, N. Y.	Typhoid malaria.
McNamara, T. W.....	Pvt., L	Sept. 7	Troy, N. Y.....	Typhoid.
Morrison, C. H.....	Pvt., D	Aug. 10	Fort McPherson, Ga.	Do.
Nellis, Webster W.....	Pvt., H	Sept. 21	Amsterdam, N. Y.....	Do.
O'Brien, Michael J.....	Pvt., C	Aug. 19	Fernandina, Fla.....	Do.
Olena, Edgar J.....	Pvt., D	Sept. 4	Troy, N. Y.....	Do.
Parker, R. A.....	Pvt., L	Sept. 5	Fernandina, Fla.....	Do.
Parks, Frank L.....	Corpl., K	Oct. 13	South Glens Falls, N. Y.	Do.
Powers, Auer E.....	Pvt., M	Aug. 21	Fort McPherson, Ga.	Do.
Putnam, Frank A.....	Pvt., L	Aug. 31	Fernandina, Fla.....	Do.
Roach, Royal T.....	Pvt., K	Oct. 23	Saratoga Springs, N. Y.	Do.
Searing, W. J.....	Pvt., L	Aug. 19	Fernandina, Fla.....	Do.
Thayer, Charles L.....	Pvt., D	July 19	Fort McPherson, Ga.	Do.
West, Tracey E.....	Pvt., L	Aug. 7	Fernandina, Fla.....	Do.
Wilson, Warren A.....	Pvt., K	Aug. 30	Fort McPherson, Ga.	Do.
Woodcock, S. C.....	Corpl., A	Oct. 4	Troy, N. Y.....	Do.
Wylie, John L.....	Sgt., D	Aug. 25	Fernandina, Fla.....	Do.

Total deaths.....	31
Deaths due to typhoid fever.....	30
Percentage of deaths among probable cases (161) of typhoid fever, 18.63.	
Percentage of deaths among recognized cases (46) of typhoid fever, 65.21.	

It will be readily seen from these figures that we have not obtained a complete list of cases of typhoid fever in this regiment.

THIRD TENNESSEE VOLUNTEER INFANTRY.

Third Brigade, First Division, Third Army Corps.

In the May report Maj. William Bowen, surgeon in charge, makes the following statement:

On May 5, 1898, Maj. William Bowen and Capt. George Manning were mustered in at Nashville, Tenn., as surgeon and assistant

surgeon of the Third Regiment of Tennessee Volunteers. They were immediately placed on duty as examining surgeons, under command of Major Carter, U. S. Army, and served under his orders until the regiment left for Chickamauga, May 23, 1898. The regiment arrived at Camp George H. Thomas May 24, 1898. On May 27, Captain Ellis went to Chattanooga on sick leave granted by Major Bowen, approved by Col. J. P. Fyffe, regimental commander, and recent reports from his attending physician show him to be seriously ill. No second assistant surgeon has yet been mustered into the regiment. The health of the regiment has been admirable, considering the fact that nearly all the men are new to the diet and exposure of campaign life. Several incompetent men succeeded in passing the examining board at Nashville, Tenn., and discharges for disability will be recommended for them as soon as possible. The water supply of the camp is poor. The water is warm and is contaminated by bathing and excrement in the creek above the source of the supply.

CONDENSED SICK REPORT FOR MAY.

Mean strength.....	997
Acute diarrhea.....	25
Intermittent malaria.....	2
Subacute gastritis.....	3
Acute dysentery.....	2
Gastro-enteritis.....	1
Other diseases.....	32
Total.....	65

In the June report Major Bowen states:

The large percentage of diarrhea is due largely to drinking water after heavy exercise in the sun.

CONDENSED SICK REPORT FOR JUNE.

Mean strength.....	1,174
Typhoid fever.....	1
Intermittent malaria.....	7
Remittent malaria.....	4
Acute diarrhea.....	41
Acute dysentery.....	3
Acute enteritis.....	3
Subacute enteritis.....	1
Acute gastritis.....	2
Subacute gastritis.....	2
Acute intestinal colic.....	1
Other diseases.....	125
Total.....	190

In the July report Major Bowen states:

The number of cases of typhoid fever is, in my opinion, due rather to general climatic conditions than to any unhygienic or unsanitary state of affairs. Remittent malarial fevers are frequently present in this section throughout the rainy season. The small number of cases of mumps and measles tend to show that conditions favoring infection and contagion are at a minimum. Coryza, pharyngitis, bronchitis, rheumatism, and neuralgia have been quite prominent, largely owing to the fact that the shelter furnished the men has been very imperfect and the atmosphere very humid.

CONDENSED SICK REPORT FOR JULY.

Mean strength.....	1,297
Typhoid fever.....	15
Intermittent malaria.....	4
Remittent malaria.....	26

Acute diarrhea	28
Acute dysentery	8
Subacute enteritis	1
Subacute gastritis	3
Acute dyspepsia	1
Gastric and intestinal indigestion	3
Hepatic engorgement	19
Other diseases	80
Total	188

From the August report we have failed to extract anything more than the following general numerical data:

CONDENSED SICK REPORT FOR AUGUST.

Mean strength	1,191
Admissions:	
Remaining from last month	35
From command	419
Total	454
Returned to duty	388
Died	5
Transferred to other hospitals	20
Total	413
Remaining on sick report:	
Hospital	413
Quarters	41

There are no comments made on this report.

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength	1,198
Admissions:	
Remaining from last month	58
From command	338
Total	396
Returned to duty	352
Died	1
Transferred to other hospitals	10
Total	363
Remaining on sick report:	
Hospital	10
Quarters	23

On September 5 this regiment left Chickamauga Park, Ga., and went to Anniston, Ala.

In the October report Major Bowen states:

The large number of cases of measles and mumps prevailing in the command is due to the fact that a majority of the men composing the regiment were raised in the mountains and thus not exposed to these diseases during childhood.

We have no numerical data from the reports for October and November.

In November Major Bowen states:

The health of the command has been remarkably good. The few cases in the division hospital were mostly measles and mumps. There is now neither typhoid nor malarial fever in the regiment. The regimental hospital answers admirably the purpose for which it was instituted. Many cases after a few days detention can be returned to duty. These might have become seriously ill if left in quarters.

The following is a list of the probable cases of typhoid fever in this regiment:

- No. 1. Company F: Malarial fever, June 9 to July 10.
- No. 2. Company M: Typhoid fever, June 16; disposition not given.
- No. 3. Company E: Intermittent malaria, June 16; disposition not given.
- No. 4. Company E: Intermittent malaria, June 20; still sick July 31.
- No. 5. Company E: Intermittent malaria, June 26; still sick July 31.
- No. 6. Company D: Typhoid fever, July 2; sent to Fort McPherson July 24.
- No. 7. Company E: Typhoid fever, July 4; furloughed July 29.
- No. 8. Company K: Typhoid fever, July 4; furloughed August 1.
- No. 9. Company H: Subacute gastritis, July 4 to 22.
- No. 10. Company A: Remittent malaria, July 5; furloughed July 16.
- No. 11. Company G: Intermittent malaria, July 5; still sick July 31.
- No. 12. Company E: Typhoid fever, July 7; still sick in division hospital July 31.
- No. 13. Company E: Remittent malaria, July 8; still sick in division hospital July 31.
- No. 14. Company G: Intermittent malaria, July 9; still sick July 31.
- No. 15. Company D: Remittent malaria, July 10 to 23.
- No. 16. Company D: Typhoid fever, July 12; still sick in division hospital July 31.
- No. 17. Company E: Typhoid fever, July 14; still sick in division hospital July 31.
- No. 18. Company C: Intermittent malaria, July 15; still sick July 31.
- No. 19. Company E: Intermittent malaria, July 16; furloughed July 25.
- No. 20. Company C: Typhoid fever, July 17; still sick in division hospital July 31.
- No. 21. Company B: Diarrhea, July 19 to 30.
- No. 22. Company B: Typhoid fever, July 20; furloughed from Leiter Hospital August 23.
- No. 23. Company D: Typhoid fever, July 21; furloughed July 24.
- No. 24. Company C: Remittent malaria, July 23; furloughed August 1.
- No. 25. Company C: Remittent malaria, July 23; furloughed August 5.
- No. 26. Company H: Typhoid fever, July 23; furloughed August 26.
- No. 27. Band: Typhoid fever, July 24; died August 1.
- No. 28. Band: Typhoid fever, July 26; furloughed August 26.
- No. 29. Company G: Typhoid fever, July 27; disposition not given.
- No. 30. Band: Remittent malaria, July 27; furloughed August 14.
- No. 31. Company D: Remittent malaria, July 29; furloughed August 8.
- No. 32. Company F: Remittent malaria, July 29; still sick August 31.
- No. 33. Company I: Remittent malaria, July 29; still sick August 31.
- No. 34. Company B: Typhoid fever, July 30; furloughed August 3.
- No. 35. Company C: Typhoid fever, July 31; disposition not given.
- No. 36. Company G: Typhoid fever, August 1; furloughed August 23.
- No. 37. Company H: Typhoid fever, August 1; died October 9.
- No. 38. Company D: Remittent malaria, August 1; furloughed August 13.

No. 39. Company D: Remittent malaria, August 1; furloughed August 13.

No. 40. Company F: Remittent malaria, August 3; furloughed August 8.

No. 41. Company K: Typhoid fever, August 3; furloughed from Sternberg Hospital August 19.

No. 42. Band: Remittent malaria, August 3; furloughed August 15.

No. 43. Company G: Remittent malaria, August 3; furloughed August 23.

No. 44. Company G: Typhoid fever, August 3; furloughed August 11.

No. 45. Company C: Remittent malaria, August 3; furloughed August 14.

No. 46. Company L: Remittent malaria, August 3; furloughed August 15.

No. 47. Company H: Typhoid fever, August 3; died August 9.

No. 48. Company G: Typhoid fever, August 3; furloughed August 11.

No. 49. Company E: Typhoid fever, August 3; died August 17.

No. 50. Company E: Typhoid fever, August 3; died August 17.

No. 51. Company K: Remittent malaria, August 5; furloughed August 11.

No. 52. Company H: Remittent malaria, August 6; furloughed August 23.

No. 53. Company D: Remittent malaria, August 8; furloughed August 25.

No. 54. Company E: Typhoid fever, August 8; furloughed August 30.

No. 55. Company D: Typhoid fever, August 10; disposition not given.

No. 56. Company F: Remittent malaria, August 10; furloughed August 31.

No. 57. Band: Remittent malaria, August 11; furloughed August 23.

No. 58. Company E: Typhoid fever, August 11; furloughed from Sternberg Hospital October 4.

No. 59. Company C: Remittent malaria, August 11; furloughed August 29.

No. 60. Company B: Typhoid fever, August 11; still sick in Sternberg Hospital August 31.

No. 61. Company E: Remittent malaria, August 12; still sick in Sternberg Hospital August 31.

No. 62. Company H: Remittent malaria, August 12; furloughed August 19.

No. 63. Company C: Remittent malaria, August 12; furloughed August 23.

No. 64. Company E: Typhoid fever, August 12; furloughed from Sternburg Hospital September 3.

No. 65. Company H: Typhoid fever, August 12; furloughed August 30.

No. 66. Company L: Remittent malaria, August 12 to 30.

No. 67. Company L: Remittent malaria, August 12 to 26.

No. 68. Company D: Remittent malaria, August 13; furloughed August 23.

No. 69. Company G: Remittent malaria, August 15; furloughed August 30.

No. 70. Company B: Remittent malaria, August 15; furloughed August 30.

No. 71. Company B: Remittent malaria, August 17; furloughed August 23.

No. 72. Company K: Remittent malaria, August 17; furloughed August 20.

No. 73. Company B: Remittent malaria, August 17; furloughed August 23.

No. 74. Company K: Typhoid fever, August 18 to October 1.

No. 75. Company B: Remittent malaria, August 18; furloughed August 29.

No. 76. Company D: Typhoid fever, August 18; died in Sternberg Hospital October 6.

No. 77. Company K: Typhoid fever, August 19; still sick in Sternberg Hospital August 30.

No. 78. Company C: Typhoid fever, August 19; furloughed from Sternberg Hospital September 10.

No. 79. Company G: Remittent malaria, August 19; furloughed August 30.

No. 80. Company B: Remittent malaria, August 19; furloughed August 30.

No. 81. Company D: Remittent malaria, August 19; furloughed August 30.

No. 82. Company A: Remittent malaria, August 19; furloughed August 26.

No. 83. Company F: Remittent malaria, August 20; still sick in Sternberg Hospital in September.

No. 84. Company B: Remittent malaria, August 20; furloughed August 22.

No. 85. Company M: Typhoid fever, August 20; furloughed August 23.

No. 86. Band: Remittent malaria, August 20; furloughed August 23.

No. 87. Company A: Typhoid fever, August 20; furloughed from Sternberg Hospital September 23.

No. 88. Company K: Typhoid fever, August 20; furloughed September 22.

No. 89. Company B: Typhoid fever, August 20; still sick in Sternberg Hospital in September.

No. 90. Company F: Remittent malaria, August 20; furloughed August 27.

No. 91. Company I: Typhoid fever, August 21; still sick in Sternberg Hospital in September.

No. 92. Company E: Typhoid fever, August 23; furloughed September 10.

No. 93. Company H: Typhoid fever, August 23; still sick in Sternberg Hospital in September.

No. 94. Company F: Typhoid fever, August 23; furloughed August 27.

No. 95. Company A: Typhoid fever, August 25; still sick in Sternberg Hospital in September.

No. 96. Company E: Typhoid fever, August 26; furloughed from Sternberg Hospital October 15.

No. 97. Company L: Typhoid fever, August 29; furloughed from Sternberg Hospital November 14.

No. 98. Company I: Typhoid fever, August 30; furloughed November 5.

No. 99. Company K: Typhoid fever, August 30; furloughed from Sternberg Hospital September 5.

No. 100. Company A: Typhoid fever, August 30; furloughed from Sternberg Hospital September 9.

No. 101. Company M: Typhoid fever, August 30; furloughed from Sternberg Hospital October 20.

No. 102. Company B: Typhoid fever, September 4; furloughed from Sternberg Hospital September 17.

No. 103. Company E: Typhoid fever, September 4; furloughed from Sternberg Hospital September 17.

No. 104. Company I: Typhoid fever, September 4; died in Sternberg Hospital September 23.

No. 105. Company E: Typhoid fever, September 4; furloughed from Sternberg Hospital September 23.

No. 106. Company F: Typhoid fever, September 5; furloughed from Sternberg Hospital September 13.

No. 107. Company K: Typhoid fever, September 6; furloughed from Sternberg Hospital September 26.

No. 108. Company K: Typhoid fever, September 11; furloughed from division hospital September 19.

No. 109. Company A: Typhoid fever, September 15; disposition not given.

No. 110. Company B: Remittent malaria, September 20; furloughed September 30.

No. 111. Company K: Remittent malaria, September 21 to October 31.

No. 112. Company A: Remittent malaria, September 21; furloughed from division hospital October 31.

No. 113. Company C: Remittent malaria, September 24; furloughed from hospital October 18.

No. 114. Company B: Malarial fever, October 5; discharged from Fort Thomas December 17.

No. 115. Company B: Malaria, October 5; discharged from Fort Thomas December 17.

No. 116. Company I: Typhoid fever, October 9; furloughed November 11. This man is recorded as being convalescing from typhoid fever, but his name does not occur upon any previous record.

No. 117. Company C: Malarial fever, October 9 to 24.

No. 118. Company I: Typhoid fever, October 10; furloughed October 16.

No. 119. Company D: Typhoid fever, October 13; furloughed October 16. This man is recorded as being convalescing from typhoid fever, but his name can not be found on any previous record.

No. 120. Company F: Typhoid fever, October 15. This man is recorded as being received from Leiter Hospital and as convalescing from typhoid fever, but his name does not occur upon any previous record.

No. 121. Company A: Remittent malaria, October 26 to November 10.

No. 122. Company B: Typhoid fever, October 29; furloughed October 30.

No. 123. Company G: Remittent malaria, October 30; furloughed November 10.

SUMMARY.

Assembled at Nashville, Tenn., in April, 1898.	
Mustered into United States service May 5, 1898.	
Arrived at Chickamauga Park, Ga., May 24, 1898.	
Strength on arrival, 997.	
Date of first case of probable typhoid fever June 9, 1898.	
Date of first case of recognized typhoid fever June 16, 1898.	
Left Chickamauga Park, Ga., September 5, 1898.	
Strength on departure, 1,293.	
Number of cases of probable typhoid fever developed at Chickamauga	106
Arrived at Anniston, Ala., September 6, 1898.	
Number of cases of probable typhoid fever developed after reaching Anniston, Ala.	17
Total number of cases of probable typhoid fever developed in the Third Tennessee Volunteer Infantry from May to September, 1898.	123

It will be seen that in the above summary we have not taken the case of Captain Ellis as the first probable case of typhoid fever. By turning back to the May report by Major Bowen it will be seen that Captain Ellis was taken sick May 27 and sent to Chattanooga, where he became quite seriously ill. The nature of the illness is not given, and we have therefore not included it in our list of typhoid cases.

These 123 cases were diagnosed as follows:

Typhoid fever	61
Malaria	60
Subacute gastritis	1
Diarrhea	1
Total	123

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Dyer, Hugh W.	Pvt., M.	1898, Sept. 22	Chickamauga Park, Ga.	Typhoid; complication, measles.
Ford, William E.	Sgt., H.	Aug. 3	Chattanooga, Tenn.	Typhoid.
Francis, R. W.	Pvt., G.	Sept. 15	Anniston, Ala.	Pneumonia.
French, L. A.	Pvt., C.	Sept. 19	Piedmont, Tenn.	Typhoid.
Geil, Joseph T.	Band.	Aug. 1	Chickamauga, Ga.	Do.
Hughes, Samuel	Pvt., D.	Oct. 6	do	Typhoid; chronic dysentery.
Jackson, C. R.	Pvt., L.	Nov. 21	Near Wartburg, Tenn.	Consumption.
McCrosky, R. B.	Corpl., F.	Sept. 20	Camp Shipp, Ala.	Cerebro-spinal meningitis.
Perkey, David E.	Pvt., B.	Oct. 11	Anniston, Ala.	Typhoid.
Plemmons, J. L.	Pvt., M.	Sept. 6	Chattanooga, Tenn.	Typhoid; malarial remittent.
Priece, William	Pvt., D.	Sept. 30	do	Typhoid fever.
Richmond, Lester E.	Pvt., E.	Aug. 14	Inman, Tenn.	Typhoid.
Shoemaker, S. D.	Corpl., A.	Jan. 30	Camp Shipp, Ala.	Pneumonia.
Smith, Will.	Pvt., A.	Oct. 10	do	Typhoid.
Steepe, Nathan F.	Pvt., K.	Aug. 25	Camp Thomas, Ga.	Meningitis.
Sweet, Charles	Pvt., H.	Aug. 9	Chickamauga, Ga.	Typhoid.
Tilghman, J. C.	Pvt., E.	Aug. 17	Hill City, Tenn.	Do.
Triplet, R. S., jr.	2d Lt., M.	Sept. 21	Anniston, Ala.	Cerebral meningitis.
Troutman, John B.	Corpl., K.	Sept. 12	Camp Shipp, Ala.	Bronchial pneumonia.

Total deaths	19
Deaths from typhoid fever	12

Percentage of deaths among probable cases (123) of typhoid fever, 9.75.

Percentage of deaths among recognized cases (61) of typhoid fever, 19.67.

COMMUNICATIONS FROM THE SURGEONS OF THE THIRD TENNESSEE VOLUNTEER INFANTRY.

Medical officers.

William Bowen, major and surgeon, Knoxville, Tenn.

George W. Roberts, captain and assistant surgeon, Knoxville, Tenn.

Claude C. Pierce, lieutenant and assistant surgeon, Chattanooga, Tenn.

Under date of July 18, 1899, Lieutenant Pierce sends us the following statement:

While camped at Nashville, the mobilization point for Tennessee troops, the water supply was derived partly from a spring whose outlet was slightly below the level of the camp, partly from a well some 30 feet deep, and partly from the city supply pipes from the State penitentiary, which was near.

At this place sinks were dug to a depth of 10 feet in a soft and loamy soil, with a clay subsoil.

While camped at Chickamauga the water supply was derived from Chickamauga Creek. This water was not filtered and was distributed to the various regiments in surface pipes exposed to the sun. At no place near our camp at Chickamauga could sinks be dug much deeper than 4 feet, as at this depth solid limestone was encountered. Waste from the kitchen was dumped into similar sinks and was covered with earth. Tents were daily rolled up for ventilation and the company streets were thoroughly policed. Excreta from patients was emptied into special sinks and a strong solution of bichloride of mercury was used in the bedpans. The rain caused the overflow of certain sinks. Myriads of flies infested all parts of the camp, especially around the sinks and kitchens.

At Anniston, Ala., the sinks were dug to a depth of 12 feet and were prepared before the arrival of the regiment, which was not the case at Chickamauga. Kitchen slops were placed in covered, water-tight barrels, and were removed daily by employees of the quartermaster's department to a distance of 2 miles or more and

were disposed of by feeding to hogs. The regiment remained at Anniston from September 1, 1898, to February 1, 1899, when it was mustered out of service.

Major Bowen states:

In July, 1898, there were 15 cases of typhoid fever. These cases were undoubted and, in the light of my present experience, I would say were largely due to drinking of surface water, inadequate sinks, and flies.

In August and September typhoid continued to show up, and may be attributed to similar causes as in July. The sinks could never be satisfactorily closed. The proximity of sinks to kitchens caused the food to become infected by the flies, and the poor water supplied caused the men to drink surface water.

Few beer drinkers had typhoid or malarial fever in the Third Tennessee, and this I attribute to the fact that they drank little water. The water was, in my opinion, the prime cause of typhoid.

In the summing up of probable typhoid cases in the regiment I must disagree. I must reserve to myself the right to say positively that I can usually differentiate between typhoid and intermittent malarial fever, especially as the microscope was called into use in several instances. Any cases that I diagnosed as malarial intermittent fever were very positively malarial intermittent fever. The cases marked malarial remittent fever I am not so positive of, but some few of these were undoubtedly of a peculiar malarial type that I intended looking into this summer, but will not be able to do so. I found in a number of these cases a peculiar parasite differing, but not markedly, from the known plasmodia. In these very cases I found no sign of the typhoid bacillus, nor was there reaction with the culture. These cases ran an almost typical typhoid course, and one post-mortem that I saw in a case that was diagnosed typhoid showed no lesion of Peyer's patches. Of the individual cases I can tell you nothing positively.

I have been practicing in the South, 100 miles from Chickamauga, Ga., for ten years; have been teaching pathology and bacteriology for a number of years, and consider myself fairly competent as a diagnostician, and would beg to go on record as adhering to my first diagnosis in all cases, except malarial remittents, and believe my original diagnosis to have been right in the majority of them. The health of the regiment was never good at Chickamauga. The close contiguity of the regiment to the First Mississippi was unfortunate, but when the camp was moved to an open field, about August 12, there was immediate improvement, and from the date of arrival at Anniston, on September 6, the health of the regiment was almost ideal.

FIRST VERMONT VOLUNTEER INFANTRY.

Third Brigade, First Division, Third Army Corps.

In the May report Capt. James M. Hamilton states:

This regiment was mustered into the service of the United States between May 3 and May 16, 1898. It left Camp Olympia, near Burlington, Vt., the point of mobilization and muster, May 21, and arrived at Camp George H. Thomas, Chickamauga Park, Ga., May 24, 1898. The condition of the command has been remarkably good from a medical standpoint, considering change of mode of living and of climate. Since removal to Chickamauga the prevailing diseases have been bronchitis and diarrhea, neither of a severe type. The bowel trouble has been caused by indiscreet use of poor water and bad drinks sold by hucksters. The medical department has attempted to regulate this matter, and has met with fairly good success.

CONDENSED SICK REPORT FROM MAY 16 TO 31, INCLUSIVE.

Mean strength	1,026
Diarrhea	39
Dysentery	2

Indigestion	2
Intestinal colic	3
Other diseases	54
Total	100

In the June report Lieut. J. W. Jackson, acting surgeon, states:

We have a good many cases suffering from the effects of vaccination, but all are now improving. Typhoid fever is beginning to appear, and I fear that we may have a good many cases of this disease.

CONDENSED SICK REPORT FOR JUNE.

Mean strength	1,004
Typhoid fever	5
Diarrhea	140
Dysentery	8
Intestinal dyspepsia	2
Indigestion	11
Intermittent malaria	5
Remittent malaria	4
Other diseases	113
Total	288

The July report is signed by Captain Hamilton without comment.

CONDENSED SICK REPORT FOR JULY.

Mean strength	901
Diarrhea	91
Typhoid fever	27
Intermittent malaria	54
Gastric indigestion	7
Dysentery	12
Gastritis	5
Enteritis	2
Remittent malaria	4
Intestinal indigestion	1
Other diseases	77
Total	280

During this month there are reported a number of cases of German measles, confined chiefly to two companies.

In the August report Major Hamilton makes the following statement:

This command consists of twelve companies and a detachment of hospital corps. August 19 it left Camp George H. Thomas, Chickamauga Park, Ga., and arrived at Fort Ethan Allen, Vt., August 21. August 17 Maj. H. H. Lee's resignation as surgeon was accepted, and Capt. James Hamilton was promoted to major and surgeon. This command has had much typhoid fever, caused undoubtedly by the insanitary condition of Camp Thomas. Since arriving at Fort Ethan Allen all stools have been disinfected and then buried. All mattresses and pillows used by typhoid patients have been disinfected, and all possible means have been adopted to prevent the spread of the infection.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength not given.	
Typhoid fever	66
Intermittent malaria	231
Remittent malaria	22
Diarrhea	128

Gastritis	4
Gastralgia	1
Intestinal indigestion	1
Dysentery	15
Enteritis	1
Gastric indigestion	15
Debility and diarrhea	1
Indigestion	5
Other diseases	155
Total	645

In the September report Major Hamilton states:

On September 4, in accordance with General Orders, No. 130, A. G. O., the entire regiment, save the necessary property guard and the medical department, was given thirty days' leave of absence and furlough. The prevailing sickness in the regiment has been typhoid fever acquired at Chickamauga Park, Ga.

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength for four days	989
Typhoid fever	50
Intermittent malaria	102
Diarrhea	43
Remittent malaria	2
Gastritis	1
Dysentery	6
Gastric indigestion	2
Other diseases	36
Total	242

In the October report Major Hamilton states:

All the regiment except the medical department is absent from camp; many at their homes are coming down with typhoid fever. The last patient went from the hospital here October 19.

CONDENSED SICK REPORT FOR OCTOBER.

Mean strength not given.	
Rheumatism	1
Chancroid	1
Typhoid fever	11
Total	13

The following is a list of the recognized and probable cases of typhoid fever in this regiment:

No. 1. Company G: Diarrhea and heat exhaustion, May 26 to June 22.

No. 2. Company G: Diarrhea, May 28 to June 12.

No. 3. Company A: Diarrhea, June 5 to 15.

No. 4. Company A: Diarrhea, June 7 to 19.

No. 5. Company M: Diarrhea, June 10; sent to division hospital June 21. There is no record of this man leaving the hospital. His name next occurs on sick report with diarrhea from August 3 to 14, and then with quotidian malaria from August 14 to 21.

No. 6. Company K: Malaria, June 10; sent to division hospital June 29. There is no record of this man leaving the hospital. He is reported with diarrhea August 8 to 18.

No. 7. G: Enteritis, June 16; sent to division hospital June 18; still sick in hospital August 23.

No. 8. Company D: Typhoid fever, June 26; died August 25.

No. 9. Company F: Typhoid fever, June 29; sent to Fort McPherson July 24.

No. 10. Company E: Typhoid fever, June 30 to August 6.

No. 11. Company F: Typhoid fever, June 30; sent to Fort McPherson July 24.

No. 12. Company D: Typhoid fever, July 1; furloughed from division hospital August 22.

No. 13. Staff: Typhoid fever, July 2; still sick July 31.

No. 14. Company F: Indigestion, July 6; sent to division hospital July 28. The time of leaving hospital is not given; however, the patient probably did not remain but a few days, as his name again occurs on sick report with malaria, from August 4 to 12.

No. 15. Company F: Diarrhea, July 6; still sick August 31.

No. 16. Company B: Diarrhea, July 6; sent to division hospital July 16. There is no further record of this case.

No. 17. Company D: Typhoid fever, July 7; died July 12.

No. 18. Company F: Malaria, July 8; sent to division hospital August 23. It seems that this man was returned to quarters July 29, but was not able to return to duty and was again sent to the hospital.

No. 19. Company K: Diarrhea, July 8; still sick July 31.

No. 20. Company not given: Diarrhea, July 8 to August 23.

No. 21. Company I: Typhoid fever, July 9 to August 16.

No. 22. Company M: Typhoid fever, July 10; sent to Fort McPherson July 24.

No. 23. Company F: Diarrhea, July 10; sent to hospital July 22. There is no further record of this case.

No. 24. Company F: Typhoid fever, July 11 to August 18.

No. 25. Company not given: Diarrhea, July 11 to August 13.

No. 26. Company L: Intermittent malaria, July 12 to August 1.

No. 27. Company not given: Diarrhea, July 12; sent to division hospital July 26. There is no further record of this case.

No. 28. Company L: Typhoid fever, July 12 to August 23.

No. 29. Company L: Intermittent malaria, July 13 to 23.

No. 30. Company L: Typhoid fever, July 13; sent to Fort McPherson July 24.

No. 31. Company F: Gastritis, July 14; sent to division hospital August 4. There is no further record of this case.

No. 32. Company H: Diarrhea, July 14 to 30.

No. 33. Company F: Intermittent malaria, July 14; still sick July 31.

No. 34. Company B: Malaria, July 14; died July 29.

No. 35. Company I: Gastritis, July 15; sent to division hospital July 30; returned to duty August 7.

No. 36. Company I: Diarrhea, July 15; still sick August 31.

No. 37. Company C: Typhoid fever, July 16; sent to Fort McPherson July 24.

No. 38. Company A: Remittent malaria, July 16; still sick in hospital July 31.

No. 39. Company A: Diarrhea, July 18; still sick in hospital July 31.

No. 40. Company F: Typhoid fever, July 18; sent to Fort McPherson July 24.

No. 41. Hospital steward: Indigestion, July 19 to August 23.

No. 42. Company B: Typhoid fever, July 19; died July 25.

No. 43. Company D: Intermittent malaria, July 20 to September 1.

No. 44. Company L: Diarrhea, July 20 to August 5.

No. 45. Company F: Typhoid fever, July 20 to August 23. This man is recorded as having had diarrhea June 15 and 16.

No. 46. Company L: Typhoid fever, July 20; furloughed August 12.

No. 47. Company B: Tertian malaria, July 20; sent to division hospital August 7. There is no further record of this case.

No. 48. Company E: Typhoid fever, July 20 to September 18.

No. 49. Company L: Intermittent malaria, July 21 to 31.

No. 50. Company C: Typhoid fever, July 21; sent to Fort McPherson July 24.

No. 51. Company L: Typhoid fever, July 21; sent to Fort McPherson July 24.

No. 52. Company F: Diarrhea, July 21; still sick in hospital July 31.

No. 53. Band: Diarrhea, July 21; still sick in hospital July 31.

No. 54. Company H: Typhoid fever, July 21; sent to Fort McPherson July 24.

No. 55. Company D: Malaria, July 22 to August 12.

- No. 56. Company E: Malaria, July 22; sent to Fort Ethan Allen August 18.
- No. 57. Company I: Intermittent malaria, July 22; still sick August 23.
- No. 58. Company D: Tertian malaria, July 22 to August 5.
- No. 59. Company D: Quotidian malaria, July 22; still sick September 2.
- No. 60. Company M: Remittent malaria, July 23; furloughed August 6.
- No. 61. Company A: Intermittent malaria, July 23 to August 21.
- No. 62. Company I: Remittent malaria, July 23; sent to Fort Ethan Allen August 24.
- No. 63. Company L: Diarrhea, July 24 to August 23.
- No. 64. Company M: Typhoid fever, July 24; disposition not given.
- No. 65. Company E: Typhoid fever, July 24 to August 23.
- No. 66. Company D: Remittent malaria, July 24 to August 24.
- No. 67. Company F: Typhoid fever, July 24 to August 23.
- No. 68. Company A: Diarrhea, July 24; furloughed August 23.
- No. 69. Company D: Quotidian malaria, July 24; furloughed August 8.
- No. 70. Company L: Diarrhea, July 24; furloughed August 9.
- No. 71. Company L: Diarrhea, July 24; furloughed August 23.
- No. 72. Company B: General debility, July 24 to August 25.
- No. 73. Company F: Typhoid fever, July 25; died August 10.
- No. 74. Company B: Typhoid fever, July 25; furloughed August 24. This man is reported with dysentery July 11 to 16.
- No. 75. Company H: Quotidian malaria, July 25; still sick August 21.
- No. 76. Company I: Quotidian malaria, July 25; furloughed August 9.
- No. 77. Staff: Typhoid fever, July 25; returned to duty August 21, and furloughed September 4.
- No. 78. Company I: Quotidian malaria, July 25; furloughed August 22.
- No. 79. Company A: Malaria, July 25; furloughed August 25.
- No. 80. Company not given: Quotidian malaria, July 25; furloughed August 22.
- No. 81. Company D: Quotidian malaria, July 25; furloughed August 7.
- No. 82. Company C: Quotidian malaria, July 26; furloughed August 10.
- No. 83. Company K: Intermittent malaria, July 26; furloughed August 5.
- No. 84. Company L: Gastritis, July 26; furloughed August 4.
- No. 85. Company K: Quotidian malaria, July 26; furloughed August 30.
- No. 86. Company G: Dysentery, July 26; furloughed August 10.
- No. 87. Company B: Intermittent malaria, July 26; furloughed August 5.
- No. 88. Staff: Typhoid fever, July 27; furloughed August 1.
- No. 89. Company K: Diarrhea, July 27; furloughed August 22.
- No. 90. Company B: Tertian malaria, July 27; furloughed August 11.
- No. 91. Company M: Dysentery, July 27 to August 21.
- No. 92. Company L: Quotidian malaria, July 28; sent to Fort Ethan Allen August 21.
- No. 93. Company F: Malaria, July 28; sent to Fort Ethan Allen August 21.
- No. 94. Company A: Intermittent malaria, July 28 to August 22.
- No. 95. Company M: Quotidian malaria, July 28 to August 21.
- No. 96. Company M: Intermittent malaria, July 29; sent to Fort Ethan Allen August 24.
- No. 97. Company I: Intermittent malaria July 29; died. Date of death not given.
- No. 98. Company B: Diarrhea, July 29; furloughed August 12.
- No. 99. Company A: Typhoid fever, July 30; sent to Fort Ethan Allen August 21.
- No. 100. Company L: Intermittent malaria, July 30; furloughed August 11.
- No. 101. Company B: Intermittent malaria, July 30; furloughed August 18.
- No. 102. Company H: Quotidian malaria, July 30; furloughed August 21.
- No. 103. Company B: Quotidian malaria, July 31; furloughed August 26.
- No. 104. Company F: Enteritis, July 31; furloughed August 24.
- No. 105. Company A: Diarrhea, August 1; furloughed September 4.
- No. 106. Company not given: Remittent malaria, August 1; furloughed August 28.
- No. 107. Company I: Quotidian malaria, August 1; furloughed August 18.
- No. 108. Company E: Typhoid fever, August 1 to 25.
- No. 109. Company not given: Dysentery, August 1 to 25.
- No. 110. Company L: Quotidian malaria, August 1; furloughed August 23.
- No. 111. Company K: Quotidian malaria, August 1; furloughed August 23.
- No. 112. Company F: Intermittent malaria, August 1; furloughed August 21.
- No. 113. Company not given: Quotidian malaria, August 1; furloughed August 23.
- No. 114. Company M: Gastric indigestion, August 2; furloughed August 13.
- No. 115. Company H: Diarrhea, August 2; furloughed August 18.
- No. 116. Company E: Typhoid fever, August 2; sent to Fort Ethan Allen August 24.
- No. 117. Company E: Typhoid fever, August 2 to September 13.
- No. 118. Company G: Remittent malaria, August 3; still sick August 31.
- No. 119. Company G: Diarrhea, August 3 to 23.
- No. 120. Company C: Quotidian malaria, August 3; furloughed August 21.
- No. 121. Company I: Malaria, August 3; furloughed August 22.
- No. 122. Company B: Diarrhea, August 3; furloughed September 4.
- No. 123. Company G: General debility, August 3; furloughed August 23.
- No. 124. Company B: Typhoid fever, August 3; sent to Fort Ethan Allen August 21.
- No. 125. Company B: Diarrhea, August 3; still sick August 31.
- No. 126. Company not given: Indigestion, August 3; still sick August 25.
- No. 127. Company I: Typhoid fever, August 3; died August 25.
- No. 128. Company F: Remittent malaria, August 3; still sick September 30.
- No. 129. Company I: Intermittent malaria, August 4 to 29.
- No. 130. Company K: Intermittent malaria, August 4; still sick August 31.
- No. 131. Company I: Quotidian malaria, August 4; furloughed August 23.
- No. 132. Company I: Quotidian malaria, August 4; furloughed August 18.
- No. 133. Company H: Quotidian malaria, August 4; furloughed August 18.
- No. 134. Company F: Remittent malaria, August 5 to 30.
- No. 135. Company L: Intermittent malaria, August 5 to 23.
- No. 136. Staff: Typhoid fever, August 5 to 24.
- No. 137. Company H: Diarrhea, August 5; furloughed August 18.
- No. 138. Company H: Quotidian malaria, August 5; furloughed August 25.
- No. 139. Company D: Diarrhea, August 5 to September 19. In hospital this case was diagnosed typhoid fever.
- No. 140. Company G: Intermittent malaria August 6 to 25.
- No. 141. Company I: Remittent malaria August 6; still sick September 3.

No. 142. Company E: Intermittent malaria, August 6; furloughed August 23.
No. 143. Company G: Intermittent malaria, August 6; furloughed August 24.
No. 144. Company I: Intermittent malaria, August 6; furloughed August 22.
No. 145. Company I: Quotidian malaria, August 6; furloughed August 22.
No. 146. Company D: Quotidian malaria, August 6; furloughed August 22.
No. 147. Company L: Remittent malaria, August 6; sent to Fort Ethan Allen August 21.
No. 148. Company C: Quotidian malaria, August 6; furloughed September 4.
No. 149. Company F: Typhoid fever, August 6; sent to Fort Ethan Allen August 21.
No. 150. Company L: Remittent malaria, August 6 to September 6.
No. 151. Company L: Typhoid fever, August 7; furloughed September 6.
No. 152. Company A: Quotidian malaria, August 7; furloughed August 24.
No. 153. Company G: Quotidian malaria, August 7; furloughed August 26.
No. 154. Company F: Diarrhea, August 7; furloughed August 21.
No. 155. Company not given: Quotidian malaria, August 7 to September 4.
No. 156. Staff: Typhoid fever, August 8; sent to division hospital August 10; further disposition not given.
No. 157. Company B: Diarrhea, August 8; furloughed August 19.
No. 158. Company K: Quotidian malaria, August 8; still sick August 31.
No. 159. Company I: Remittent malaria, August 8; furloughed August 22.
No. 160. Company K: Malaria, August 8 to September 13.
No. 161. Band: Typhoid fever, August 8 to September 19.
No. 162. Company F: Diarrhea, August 8; furloughed August 22.
No. 163. Company E: Typhoid fever, August 9; sick in Sternberg Hospital August 31.
No. 164. Company G: Intermittent malaria, August 9; furloughed August 23.
No. 165. Company K: Indigestion, August 9 to 29.
No. 166. Company A: Typhoid fever, August 9; sent to Ethan Allen Hospital August 21.
No. 167. Company M: Quotidian malaria, August 9; furloughed August 23.
No. 168. Company L: Malaria, August 9; furloughed August 22.
No. 169. Company F: Intermittent malaria, August 10; furloughed August 22.
No. 170. Company F: Typhoid fever, August 10; sent to Port Ethan Allen August 21.
No. 171. Company not given: Diarrhea, August 10; furloughed August 22.
No. 172. Company C: Quotidian malaria, August 10; furloughed August 23.
No. 173. Company H: Quotidian malaria, August 10; furloughed August 26.
No. 174. Company I: Typhoid fever, August 10; furloughed August 22.
No. 175. Company C: Intermittent malaria, August 11; still sick August 31.
No. 176. Company G: Intermittent malaria, August 11; furloughed August 23.
No. 177. Company F: Diarrhea, August 11; furloughed August 21.
No. 178. Company F: Intermittent malaria, August 11; furloughed August 22.
No. 179. Company E: Diarrhea, August 11; furloughed August 22.
No. 180. Company E: Diarrhea, August 11; furloughed August 22.

No. 181. Company B: Typhoid fever, August 11; furloughed August 23.
No. 182. Company H: Diarrhea, August 11; furloughed August 25. Elsewhere this man is reported with malaria, August 6 to 25.
No. 183. Company A: Diarrhea, August 12; furloughed August 25.
No. 184. Company I: Diarrhea, August 12; furloughed August 27.
No. 185. Company L: Intermittent malaria, August 12; still sick September 4.
No. 186. Company E: Intermittent malaria August 12; furloughed August 23.
No. 187. Company K: Quotidian malaria, August 12; furloughed August 26.
No. 188. Company L: Typhoid fever, August 12; furloughed August 18.
No. 189. Company K: Diarrhea, August 12; furloughed August 23.
No. 190. Company B: Remittent malaria, August 12; furloughed August 23.
No. 191. Company E: Typhoid fever, August 13; sent to Fort Ethan Allen August 18.
No. 192. Company D: Diarrhea, August 13; sent to Fort Ethan Allen August 21. At the latter place this case was recognized as one of typhoid fever.
No. 193. Company M: Typhoid fever, August 14; furloughed August 21.
No. 194. Company D: Quotidian malaria, August 14; furloughed August 25.
No. 195. Company A: Malaria, August 14; sent to Fort Ethan Allen August 21; returned to duty September 21.
No. 196. Company L: Typhoid fever, August 14 to September 29.
No. 197. Company H: Diarrhea, August 15; furloughed September 4.
No. 198. Company K: Intermittent malaria, August 15; furloughed August 24.
No. 199. Staff: Typhoid fever, August 15; furloughed September 4.
No. 200. Company D: Quotidian malaria, August 15; still sick September 30.
No. 201. Company H: Quotidian malaria, August 15; furloughed August 27.
No. 202. Company M: Malaria, August 15; sent to Fort Ethan Allen August 21; reported for duty September 20.
No. 203. Company B: Quotidian malaria, August 15; furloughed August 25.
No. 204. Company I: Quotidian malaria, August 15; furloughed August 25.
No. 205. Company F: Remittent malaria, August 15; furloughed September 2.
No. 206. Company not given: Quotidian malaria, August 16; furloughed August 26.
No. 207. Staff: Typhoid fever, August 16; sent to Ethan Allen Hospital August 21.
No. 208. Company D: Typhoid fever, August 16; sent to hospital August 21; reported for duty October 11. This man is reported as having had diarrhea August 4 and 5.
No. 209. Company A: Malaria, August 16 to September 23.
No. 210. Company not given: Malaria, August 16 to October 5.
No. 211. Company D: Quotidian malaria, August 16; furloughed September 4.
No. 212. Company F: Quotidian malaria, August 16; furloughed August 26.
No. 213. Company M: Intermittent malaria, August 17; furloughed September 4.
No. 214. Company L: Malaria, August 17 to September 16.
No. 215. Company D: Malaria, August 17; sent to Fort Ethan Allen August 21.
No. 216. Company M: Typhoid fever, August 18; sent to Ethan Allen Hospital August 21.
No. 217. Company I: Typhoid fever, August 18; sent to Fort Ethan Allen August 21; returned to duty October 11.

No. 218. Company not given: Quotidian malaria, August 18; furloughed September 4.

No. 219. Company I: Typhoid fever, August 18; sent to Fort Ethan Allen August 21; reported for duty September 27.

No. 220. Company M: Typhoid fever, August 18; sent to Fort Ethan Allen August 21; reported for duty September 26.

No. 221. Hospital corps: Typhoid fever, August 19 to October 16.

No. 222. Company not given: Quotidian malaria, August 19 to September 22.

No. 223. Company F: Quotidian malaria, August 20; furloughed September 3.

No. 224. Staff: Typhoid fever, August 21 to October 18.

No. 225. Company G: Quotidian malaria, August 22; still sick September 30.

No. 226. Company G: Quotidian malaria, August 22; furloughed September 2.

No. 227. Company D: Quotidian malaria, August 22; furloughed September 1.

No. 228. Company B: Typhoid fever, August 22; died October 18.

No. 229. Company H: Typhoid fever, August 22 to September 28.

No. 230. Company L: Typhoid fever, August 23; disposition not given.

No. 231. Company L: Typhoid fever, August 23; died September 16.

No. 232. Company C: Intermittent malaria, August 23; furloughed September 4.

No. 233. Company C: Typhoid fever, August 23 to September 19.

No. 234. Company C: Typhoid fever, August 23 to September 21.

No. 235. Company B: Malaria, August 23 to September 7.

No. 236. Company L: Typhoid fever, August 23; died September 17.

No. 237. Company C: Typhoid fever, August 24 to September 22.

No. 238. Company H: Intermittent malaria, August 24; furloughed September 4.

No. 239. Company K: Quotidian malaria, August 24; furloughed September 4.

No. 240. Company H: Quotidian malaria, August 24; furloughed September 4.

No. 241. Company not given: Typhoid fever, August 24 to September 22.

No. 242. Company H: Typhoid fever, August 24 to September 13.

No. 243. Company G: Malaria, August 24; furloughed September 2.

No. 244. Company A: Typhoid fever, August 25 to October 18.

No. 245. Company B: Malaria, August 25; furloughed September 5.

No. 246. Company K: Malaria, August 25; sent to hospital September 3. Further disposition not given.

No. 247. Company I: Typhoid fever, August 26; furloughed September 4.

No. 248. Company G: Typhoid fever, August 26 to September 30.

No. 249. Company not given: Typhoid fever, August 26; furloughed September 13.

No. 250. Company I: Typhoid fever, August 26; furloughed September 4.

No. 251. Company F: Typhoid fever, August 27; furloughed September 4.

No. 252. Company I: Diarrhea, August 27; furloughed September 4.

No. 253. Company not given: Typhoid fever, August 27; furloughed September 9.

No. 254. Company M: Typhoid fever, August 27; sent to Fort Ethan Allen August 30.

No. 255. Company A: Typhoid fever, August 27; sent to hospital August 30. Further disposition not given.

No. 256. Company I: Diarrhea, August 29; furloughed September 4.

No. 257. Staff: Typhoid fever, August 29 to September 29.

No. 258. Company not given: Quotidian malaria, August 29 to September 22.

No. 259. Company A: Diarrhea, August 30; furloughed September 4.

No. 260. Company C: Intermittent malaria, August 30; furloughed September 4.

No. 261. Company C: Intermittent malaria, August 30; furloughed September 4.

No. 262. Company C: Quotidian malaria, August 30; furloughed September 4.

No. 263. Company not given: Diarrhea, August 30; furloughed September 2.

No. 264. Company not given: Malaria, August 30 to September 28.

No. 265. Company C: Malaria, August 30; still sick September 30.

No. 266. Company F: Typhoid fever, August 30; disposition not given.

No. 267. Company F: Quotidian malaria, August 30; still sick September 30.

No. 268. Company F: Intermittent malaria, August 31; furloughed September 4.

No. 269. Company A: Diarrhea, August 31; furloughed September 4.

No. 270. Company B: Diarrhea, August 31; furloughed September 4.

No. 271. Company B: Quotidian malaria, August 31; furloughed September 4.

No. 272. Company K: Typhoid fever, August 31 to October 9.

No. 273. Hospital corps: Intermittent malaria, September 3; furloughed September 21.

No. 274. Company M: Quotidian malaria, September 3; furloughed September 21.

No. 275. Staff: Quotidian malaria, September 5; furloughed September 25.

No. 276. Company F: Typhoid fever, September 18; died October 6.

No. 277. Company L: Typhoid fever, September 26 to October 17.

No. 278. Company M: Typhoid fever, October 12; sent to Fort Ethan Allen October 18.

In the records of this regiment the word "duty" is found written where "furlough" is evidently intended. That this is the case is shown by the subsequent history of the patient and by the fact that the same record is made where cases are diagnosed typhoid fever.

SUMMARY.

Assembled at Camp Olympia, near Burlington, Vt., in April, 1898.

Mustered into United States service between May 3 and May 16, 1898.

Arrived at Chickamauga Park, Ga., May 24, 1898.

Strength on arrival, 1,026.

Date of first case of probable typhoid fever, May 26, 1898.

Date of first case of recognized typhoid fever June, 26, 1898.

Left Chickamauga Park, Ga., August 18, 1898.

Strength on departure, 996.

Number of cases of probable typhoid fever developed at Chickamauga 220

Arrived at Fort Ethan Allen, Vt., August 21, 1898.

Number of cases of probable typhoid fever developed after leaving Chickamauga Park, Ga. 58

Total number of cases of probable typhoid fever developed in the First Vermont Volunteer Infantry from May to September, 1898 278

These 278 cases were diagnosed as follows:

Typhoid fever 84

Malaria 132

Diarrhea.....	47
Indigestion.....	5
Gastritis.....	3
Dysentery.....	3
Enteritis.....	2
General debility.....	2
Total.....	278

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
1898.				
Barlow, George F.....	Pvt., F.	Sept. 16	Fort Ethan Allen, Vt.	Typhoid.
Bishop, Nelson E.....	Pvt., A.	Sept. 13	Oswell, Vt.....	Do.
Chalmers, John.....	Pvt., D.	Aug. 25	Fort Ethan Allen, Vt.	(Typhoid); malnutrition.
Curtin, Daniel F.....	2d lt.	Aug. 22	St. Vincent's Hospital, East Lake, Tenn.	Typhoid.
Dole, Arthur L.....	Pvt., F.	Aug. 9	Camp Thomas, Ga.....	Do.
Dunham, W. R.....	Pvt., E.	Sept. 5	Barre, Vt.....	(Typhoid); dysentery.
Fella, Frank.....	Pvt., C.	Aug. 2	Fort McPherson, Ga.....	Typhoid.
Flynn, James W.....	Pvt., M.	Sept. 17	Burlington, Vt.....	Do.
Foyles, Harold F.....	Pvt., A.	Sept. 6	Rutland, Vt.....	Do.
Hall, Emerson L.....	Artif., K.	Sept. 27	Hortonsville, Vt.....	(Typhoid); chronic diarrhea.
Hinman, F. L.....	Corpl., L.	Aug. 12	United States General Hospital, Fort McPherson, Ga.	Typhoid.
Lamson, Harry B.....	Corpl., E.	Aug. 14	Baltimore, Md.....	Spinal meningitis.
Leach, H.....	Pvt., B.	July 25	Chickamauga, Ga.....	Typhoid.
Marsette, W. F.....	Pvt., C.	July 18	Acute peritonitis.
Place, C. A.....	Pvt., B.	July 29	Chickamauga, Ga.....	Typhoid.
Robillard, O. H.....	Pvt., C.	Oct. 5	Rutland, Vt.....	Do.
Shannon, R. F.....	Pvt., H.	Oct. 12	Montpelier, Vt.....	Do.
Smith, George R.....	Pvt., D.	July 12	Chickamauga, Ga.....	Do.
Smith, Harley A.....	Pvt., C.	Sept. 28	Pittsford, Vt.....	Do.
Smith, Henry.....	Pvt., L.	Sept. 17	Fort Ethan Allen, Vt.	Abscess resulting from typhoid.
Spafford, W. C.....	Mus., K.	June 1	Camp Thomas, Ga.....	Pneumonia.
Sullivan, W. H.....	Sgt., B.	Sept. 18	Fort Ethan Allen, Vt.	Typhoid.
Tupper, John L.....	Mus., F.	Oct. 6do.....	Do.
Vollinger, J.....	Pvt., I.	Aug. 23do.....	Do.
Wheelock, A. E.....	Pvt., D.	Oct. 6	St. Johnsbury, Vt.....	Do.
White, Fred E.....	Pvt., A.	Oct. 15	Ira, Vt.....	Cancer.

Total deaths.....	26
Deaths due to typhoid fever.....	22

Percentage of deaths among probable cases (278) of typhoid fever, 7.91.

Percentage of deaths among recognized cases (84) of typhoid fever, 26.19.

EIGHTH NEW YORK VOLUNTEER INFANTRY.

Third Brigade, First Division, Third Army Corps.

This regiment was mustered into the service of the United States between the 6th and 21st of May at Peekskill, N. Y. It left Peekskill May 23, and arrived at Chickamauga Park, Ga., May 25. At Chickamauga it was brigaded with the First Vermont and the Third Tennessee.

The first regimental sick report covers the period from May 26 to May 31, inclusive. In this report Major Neff, surgeon of the regiment, makes the following statement:

The prevailing diseases at Peekskill were tonsillitis and bronchitis; at Camp Thomas, diarrhea. The intestinal disturbances at Camp Thomas were due to change of climate, to differences in the character of the food, and to the high temperature to which the men were not accustomed.

CONDENSED SICK REPORT, MAY 26 TO 31, INCLUSIVE.

Mean strength.....	849.5
Intermittent malaria.....	4
Diarrhea.....	11

Gastro-enteritis.....	7
Dysentery.....	4
Other diseases.....	17
Total.....	43

Four of the cases of dysentery and three of diarrhea remained on the sick list at the expiration of the month.

In the June report Major Neff states:

The prevailing diseases are intestinal disturbances and malarial fever of the intermittent type. These are due to change of climate and diet. The camp has been thoroughly policed. An effort has been made to prevent men from using water from all surface springs. The command has been vaccinated during the month.

CONDENSED SICK REPORT FOR JUNE.

Mean strength.....	1,099
Dysentery.....	5
Diarrhea.....	27
Intermittent malaria.....	22
Intestinal colic.....	6
Gastro-enteritis.....	12
Other diseases.....	43
Total.....	115

In the July report Major Neff states:

The prevailing diseases are intestinal disturbances and malarial fever of the intermittent type.

CONDENSED SICK REPORT FOR JULY.

The mean strength is recorded as 328. This must be a mistake, and in all probability it should be 1,328.

Diarrhea.....	142
Intermittent malaria.....	70
Remittent malaria.....	7
Dysentery.....	2
Typhoid fever.....	19
Gastro-enteritis.....	17
Flux.....	1
Other diseases.....	89
Total.....	347

In the August report Major Neff states:

The prevailing diseases are malarial fever of the intermittent type, intestinal colic, and typhoid. Causation: Insufficiency of tentage and impurity of water in connection with change of climate and diet. Measures of prevention: Thorough policing and filtering of all drinking water.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength.....	1,275
Typhoid fever.....	69
Diarrhea.....	518
Gastritis.....	7
Intermittent malaria.....	334
Remittent malaria.....	147
Intestinal colic.....	39
Dysentery.....	13
Pernicious malaria.....	4
Other diseases.....	7
Total.....	1,138

In the September report Major Neff repeats the same statement made in August.

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength	1,275
Inintermittent malaria	58
Remittent malaria	41
Malaria	21
Typhoid fever	164
Diarrhea	63
Intestinal colic	16
Dysentery	9
Other diseases	83
Total	455

This regiment left Chickamauga Park September 6, and was furloughed in New York September 9. Only 9 cases appear on the records as having been admitted to sick report after September 9.

In studying the sickness in this regiment we have made an alphabetical list of all names appearing on sick report, and from these have ascertained as far as possible the medical history of each case. Owing to the careless spelling of names, to the introduction or omission of initials, and to inaccuracies in statement of rank and company, this attempt to ascertain the number of total sick has proved to be not only a laborious task, but one whose results may not be absolutely correct. However, the figures arrived at are nearly exact. As we wish to make a critical study of sickness in this regiment, we will give a list of all individuals found on sick report. In doing this we will divide the sick into groups. The first group contains the cases of recognized typhoid fever, and is as follows:

No. 1. Typhoid fever, June 24; died July 1.

No. 2. Typhoid fever, July 4; sent to Leiter Hospital July 26; sent to Bellevue Hospital September 9.

No. 3. Typhoid fever, July 5; furloughed July 15. There is no further record of this case.

No. 4. Typhoid fever, July 5; sent to division hospital July 5; returned to duty August 1.

No. 5. Typhoid fever, July 10; sent to Fort McPherson July 24.

No. 6. Typhoid fever, July 10; sent to Fort McPherson July 24.

No. 7. Typhoid fever, July 11; sent to Fort McPherson July 24.

No. 8. Typhoid fever, July 14; sent to Leiter Hospital July 26; died July 31.

No. 9. Typhoid fever, July 15; sent to Leiter Hospital July 26; furloughed August 30.

No. 10. Typhoid fever, July 16; returned to duty August 5.

No. 11. Typhoid fever, July 16; sent to division hospital July 16; had endocarditis August 1.

No. 12. Typhoid fever, July 16; sent to Fort McPherson July 24. This man is reported to have suffered from heat exhaustion June 9 and 10.

No. 13. Typhoid fever, July 21; sent to division hospital July 21; furloughed August 3.

No. 14. Typhoid fever, July 23; sent to Fort McPherson July 24; returned to duty August 11.

No. 15. Typhoid fever, July 24; returned to duty August 21. This man is reported as having suffered from neuralgia July 22 and 23.

No. 16. Typhoid fever, July 21; sent to Leiter Hospital July 26; furloughed August 10. This man had the following previous illnesses: Diarrhea, June 11 to 13; intermittent malaria, July 20 and 21.

No. 17. Typhoid fever, July 29; sent to division hospital July 29; returned to duty August 21.

No. 18. Typhoid fever, July 30; furloughed August 11.

No. 19. Typhoid fever, July 31; died August 14.

No. 20. Typhoid fever, July 31; sick in Bellevue Hospital September 9.

No. 21. Typhoid fever, July 28; died August 18.

No. 22. Typhoid fever, July 28; returned to duty August 17.

No. 23. Typhoid fever, July 31; returned to duty August 14.

No. 24. Typhoid fever, July 31; returned to duty August 13. This man was probably furloughed August 13, instead of being returned to duty. Many regimental surgeons were in the habit of entering on the reports when men were furloughed "duty" or "furlough duty."

No. 25. Typhoid fever, August 2; died August 21.

No. 26. Typhoid fever, August 6; returned to quarters August 22.

No. 27. Typhoid fever, August 6; returned to duty August 31.

No. 28. Typhoid fever, August 10; returned to duty August 22.

No. 29. Typhoid fever, August 10; returned to duty August 22.

No. 30. Typhoid fever, August 22; sick leave August 31.

No. 31. Typhoid fever, August 26; died August 31. This man is recorded as having had diarrhea August 11 to 13.

No. 32. Typhoid fever, August 26; sick leave August 31.

No. 33. Typhoid fever, August 27; sick in Bellevue Hospital September 9.

No. 34. Typhoid fever, August 28; sick leave August 31. This man is registered as having had diarrhea August 1 and 2.

No. 35. Typhoid fever, August 10; returned to duty September 6.

No. 36. Typhoid fever, August 20; returned to duty September 6. This man had intermittent malaria August 8 to 13.

No. 37. Typhoid fever, August 20; sent to City Hospital, New York, September 9; returned to duty September 28. This man had intermittent malaria August 17 to 20.

No. 38. Typhoid fever, August 21; returned to duty September 16. This man had diarrhea August 12 to 14.

No. 39. Typhoid fever, August 18. There is no further record of this man.

No. 40. Typhoid fever, August 17; returned to duty September 24.

No. 41. Typhoid fever, August 17; died September 24.

No. 42. Typhoid fever, August 23; sick in Bellevue Hospital September 9. This man had neuralgia June 20 to 24.

No. 43. Typhoid fever, August 23; returned to duty September 18.

No. 44. Typhoid fever, August 23; sick in Bellevue Hospital September 9. This man had remittent malaria August 11 to 14.

No. 45. Typhoid fever, August 17; returned to duty September 24.

No. 46. Typhoid fever, August 25; sent to hospital September 9.

No. 47. Typhoid fever, August 25; returned to duty September 21.

No. 48. Typhoid fever, August 25; sent to Long Island Hospital September 9.

No. 49. Typhoid fever, August 26; sent to Sternberg Hospital August 30; furloughed October 18.

No. 50. Typhoid fever, August 26; sent to Sternberg Hospital August 30; furloughed October 4. This man is reported as having had intermittent malaria July 29, and the case is left incomplete.

No. 51. Typhoid fever, August 21; returned to duty September 18.

No. 52. Typhoid fever, August 26; returned to duty September 20.

No. 53. Typhoid fever, August 26; sent to St. Luke's Hospital September 9. This man had dysentery August 8 to 10.

No. 54. Typhoid fever, August 26; returned to duty September 30.

No. 55. Typhoid fever, August 27; returned to duty September 26.

This man is reported as having had gastro-enteritis June 2 to 26.

No. 56. Typhoid fever, August 27; sent to hospital September 9.

No. 57. Typhoid fever, August 27; sent to Long Island Hospital September 9.

No. 58. Typhoid fever, August 28; returned to duty September 18. This man is reported with intermittent malaria July 31, and the case is left incomplete.

No. 59. Typhoid fever, August 28; sent to Long Island Hospital September 9.

No. 60. Typhoid fever, August 28; returned to duty September 20.
 No. 61. Typhoid fever, August 28; returned to duty September 23.
 No. 62. Typhoid fever, August 28; returned to duty September 20.
 No. 63. Typhoid fever, August 29; sent to hospital September 9. This man is reported as having had diarrhea August 23 and 24 and diarrhea August 25 and 26.

No. 64. Typhoid fever, August 28; died September 14. This man had diarrhea July 26 to 28; diarrhea July 30 to August 2; diarrhea August 24 to 26.

No. 65. Typhoid fever, August 29; sent to Mount Vernon Hospital September 9.

No. 66. Typhoid fever, August 29; sent to Long Island Hospital September 13.

No. 67. Typhoid fever, August 30; sent to hospital September 9.

No. 68. Typhoid fever, August 31; sent to hospital September 9.

No. 69. Typhoid fever, August 31; returned to duty September 27.

No. 70. Typhoid fever, August 31; returned to duty September 25.

No. 71. Typhoid fever, August 31; no disposition given.

No. 72. Typhoid fever, August 10; sent to Presbyterian Hospital September 9. This man had dysentery August 8 to 10.

No. 73. Typhoid fever, September 9; sent to Bellevue Hospital September 9. This man had intermittent malaria August 21 to 25 and intestinal colic August 30 to September 9. Evidently his typhoid fever should date from August 21.

No. 74. Typhoid fever, September 9; sent to Bellevue Hospital September 9. This man had intermittent malaria August 22 to September 9.

No. 75. Typhoid fever, September 9; sent to St. Luke's Hospital September 9. This man had gastritis July 25 to August 6; intermittent malaria August 8 to 20; was granted sick leave August 29, and reported at St. Luke's Hospital September 9 with typhoid fever. Evidently in this case the initial date of the typhoid fever should be July 25.

No. 76. Typhoid fever, August 19; sent to Presbyterian Hospital September 9.

No. 77. Typhoid fever, September 9; sent to Presbyterian Hospital September 9. This man had intermittent malaria August 9 to 16; remittent malaria August 16 to 21, and was furloughed August 29. Evidently the initial date of this typhoid fever was August 9 instead of September 9.

No. 78. Typhoid fever, September 9; sent to St. Peter's Hospital September 9.

No. 79. Typhoid fever, September 9; sent to New York Hospital September 9. This man had diarrhea July 15 and 16; intermittent malaria August 8 to 18; was furloughed August 29, and appeared in the New York hospital September 9 with typhoid fever.

No. 80. Typhoid fever, September 9; sent to Bellevue Hospital. This man had diarrhea August 11 to 14 and intermittent malaria August 28 to September 9.

No. 81. Typhoid fever, September 9; sent to Mount Sinai Hospital September 9. This man had remittent malaria August 10 to 31.

No. 82. Typhoid fever, September 9; sent to Presbyterian Hospital September 9. This man had diarrhea August 19 to 22 and remittent malaria August 22 to 27, and was furloughed August 29.

No. 83. Typhoid fever, September 9; sent to Presbyterian Hospital September 9.

No. 84. Typhoid fever, September 9; sent to Presbyterian Hospital September 9.

No. 85. Typhoid fever, September 9; sent to Presbyterian Hospital September 9.

No. 86. Typhoid fever, August 6; sent to St. Luke's Hospital September 9. This man had intermittent malaria June 8 and 9; diarrhea, July 30 to August 6. Evidently in this case the initial date of the typhoid fever is July 30.

No. 87. Typhoid fever, September 9; sent to Presbyterian Hospital September 9. This man had intermittent malaria beginning August 21, and was granted sick leave August 29.

No. 88. Typhoid fever, September 9; sent to Long Island Hos-

pital September 9. This man had intermittent malaria August 26 to September 9.

No. 89. Typhoid fever, September 9; sent to St. Luke's Hospital September 9. This man had intermittent malaria August 24, and was furloughed August 29.

No. 90. Typhoid fever, September 9; sent to Presbyterian Hospital September 9.

No. 91. Typhoid fever, September 9; sent to St. Luke's Hospital September 9. This man had diarrhea August 18 and 19, and was furloughed August 29.

No. 92. Typhoid fever, August 28; sent to Harlem Hospital September 9. This man had diarrhea August 12 to 14.

No. 93. Typhoid fever, September 28; sent to German Hospital September 28.

No. 94. Typhoid fever, September 5; sent to St. Luke's Hospital September 9; died September 16. This man had gastroenteritis July 26 to 28.

No. 95. Typhoid fever, September 5; sent to St. Luke's Hospital September 9. This man had diarrhea August 17 to 19, diarrhea again August 22 and 23, and remittent malaria August 23 to 27. We suppose the initial date of the typhoid fever in this case to be August 17.

No. 96. Typhoid fever, September 9; sent to Bellevue Hospital September 9. This man had remittent malaria August 6 to 31.

No. 97. Typhoid fever, September 9; sent to Long Island Hospital September 9; died September 14. This man had intermittent malaria September 1 to 9.

No. 98. Typhoid fever, September 9; sent to St. Luke's Hospital September 9; died September 17.

No. 99. Typhoid fever, September 9; sent to St. Luke's Hospital September 9.

No. 100. Typhoid fever, September 9; sent to St. Luke's Hospital September 9. This man had diarrhea, August 12 and 13, intermittent malaria August 8 to 21, and was granted sick leave August 29. Evidently the initial date of the typhoid fever in this case was August 8.

No. 101. Typhoid fever, September 9; sent to St. Peter's Hospital September 9. This man had diarrhea August 26 and 27 and intermittent malaria September 1 to 9.

No. 102. Typhoid fever, September 9; sent to Presbyterian Hospital September 9.

No. 103. Typhoid fever, September 9; sent to Presbyterian Hospital September 9.

No. 104. Typhoid fever, September 9; sent to St. Luke's Hospital September 9.

No. 105. Typhoid fever, September 9; sent to Presbyterian Hospital September 9. This man had intermittent malaria August 24 to 27.

No. 106. Typhoid fever, September 9; sent to Bellevue Hospital September 9. This man had diarrhea August 14 to 16.

No. 107. Typhoid fever, September 9; sent to Presbyterian Hospital September 9. This man had diarrhea August 1 and 2, again August 12 to 22, and remittent malaria August 22 to 25.

No. 108. Typhoid fever, September 9; sent to German Hospital September 9.

No. 109. Typhoid fever, September 9; sent to New York Hospital September 9. This man was sick July 30 to August 30 with gastritis.

No. 110. Typhoid fever, September 9; sent to German Hospital September 9; died September 19.

No. 111. Typhoid fever, September 9; sent to German Hospital September 9. This man had intermittent malaria August 24 to 29 and diarrhea September 6 to 8.

No. 112. Typhoid fever, September 17; no disposition.

No. 113. Typhoid fever, September 9; sent to Presbyterian Hospital September 9. This man had intestinal colic June 2 to 4.

No. 114. Typhoid fever, September 9; sent to St. Luke's Hospital September 9; duty September 14. This man had intestinal colic August 10 to 13.

No. 115. Typhoid fever, September 9; sent to Flower Hospital September 9.

No. 116. Typhoid fever, September 9; sent to Fordham Hospital September 9. This man had diarrhea August 29 and 30.

No. 117. Typhoid fever, September 9; sent to Bellevue Hospital September 9. This man had diarrhea August 31 to September 9.

No. 118. Typhoid fever, September 9; sent to Presbyterian Hospital September 9.

No. 119. Typhoid fever, September 9; sent to Presbyterian Hospital September 9.

No. 120. Typhoid fever, September 9; sent to Presbyterian Hospital September 9. This man had intermittent malaria from August 6 to August 28, when he was granted sick leave.

No. 121. Typhoid fever, September 9; sent to New York Hospital September 9.

No. 122. Typhoid fever, September 9; sent to Mount Sinai Hospital September 9; returned to duty September 28. This man had diarrhea July 10 and 11, diarrhea August 15 to 18, remittent malaria August 18 to 22.

No. 123. Typhoid fever, September 9; sent to New York Hospital September 9. This man had remittent malaria August 21, and was granted sick leave August 27.

No. 124. Typhoid fever, September 9; sent to St. Luke's Hospital September 9. This man had bronchitis July 31 to August 1.

No. 125. Typhoid fever, September 9; no disposition given.

No. 126. Typhoid fever, September 9; sent to Bellevue Hospital September 9. This man had gastritis June 6 to 8, diarrhea August 26 and 27, diarrhea August 31 to September 9.

No. 127. Typhoid fever, September 9; sent to St. Luke's Hospital September 9; returned to duty September 15. This man had intermittent malaria August 23, and was granted sick leave August 29; he is also reported as having had diarrhea September 1 to 3.

No. 128. Typhoid fever, September 9; sent to Bellevue Hospital September 9; returned to duty September 10. This man had diarrhea August 4 to 10 and remittent malaria August 10 without any disposition.

No. 129. Typhoid fever, September 9; sent to Long Island Hospital September 9; returned to duty September 24. This man had remittent malaria September 6 to 9.

No. 130. Typhoid fever, September 9; sent to St. Francis' Hospital September 9.

No. 131. Typhoid fever, September 9; sent to St. Luke's Hospital September 9. This man had diarrhea August 31 to September 4.

No. 132. Typhoid fever, September 9; sent to St. Luke's Hospital September 9.

No. 133. Typhoid fever, September 9; sent to Presbyterian Hospital September 9. This man had intermittent malaria August 10 to 15, diarrhea August 19 to 21, remittent malaria August 21, and is next reported with typhoid fever September 9.

No. 134. Typhoid fever, September 9; sent to Harlem Hospital September 9.

No. 135. Typhoid fever, September 9; sent to St. Peter's Hospital September 9.

No. 136. Typhoid fever, September 9; sent to Bellevue Hospital September 9. This man had gastro-enteritis June 28 to July 1; diarrhea August 20 and 21. We have supposed that the initial date of his typhoid fever was August 20.

No. 137. Typhoid fever, September 9; sent to Bellevue Hospital September 9; This man had diarrhea September 3 to 6; remittent malaria September 6 to 9.

No. 138. Typhoid fever, September 9; sent to Long Island Hospital September 9. This man had diarrhea August 27 and 28 and intermittent malaria August 31 to September 15. It is clear that this case was first diagnosed as diarrhea and the diagnosis was changed to intermittent malaria, but was not recorded as such until the man had been in the hospital six days with typhoid fever.

No. 139. Typhoid fever, September 9; sent to Long Island Hospital September 9.

No. 140. Typhoid fever, September 1; sent to Bellevue Hospital without date.

No. 141. Typhoid fever, September without date; sent to Presbyterian Hospital without date; returned to duty September 23. This man had intermittent malaria August 24 to 29.

No. 142. Typhoid fever, September 9; sent to Presbyterian Hospital September 9; returned to duty September 20. This man had diarrhea July 30 to August 5; intermittent malaria August 17 to 22; remittent malaria August 22; was granted sick leave August 27.

No. 143. Typhoid fever, September 9; sent to German Hospital September 9; returned to duty September 17.

No. 144. Typhoid fever, September 9; sent to Hudson Hospital September 9; returned to duty September 20. This man had diarrhea August 16 to 21.

No. 145. Typhoid fever, September 9; sent to Bellevue Hospital September 9; returned to duty September 14.

No. 146. Typhoid fever, September 9; no disposition given. This man had diarrhea August 27 and 28; diarrhea August 29 and 30, and remittent malaria September 1 to 9.

No. 147. Typhoid fever, September 9; sent to Mount Sinai Hospital September 9; returned to duty September 24. This man had intermittent malaria July 18 to 21; intermittent malaria July 29 to August 3; diarrhea August 10 to 12.

No. 148. Typhoid fever, September 9; sent to St. Luke's Hospital September 9; returned to duty September 14. This man had intermittent malaria August 13 to 18; remittent malaria August 18, and was granted sick leave August 31.

No. 149. Typhoid fever, September 9; sent to St. Luke's Hospital September 9; returned to duty September 14. This man had intermittent malaria August 13 to 18; remittent malaria August 18 to 23.

No. 150. Typhoid fever, September 9; sent to Presbyterian Hospital September 9. This man had dysentery May 31 and June 1. Evidently in this case the dysentery had nothing to do with the subsequent typhoid fever.

No. 151. Typhoid fever, September 9; sent to Long Island Hospital September 9. This man had diarrhea September 6 to 9.

No. 152. Typhoid fever, September 9; sent to St. Luke's Hospital September 9; returned to duty September 14. This man had remittent malaria July 10 and 11.

No. 153. Typhoid fever, September 9; sent to Mount Sinai Hospital September 9; returned to duty September 16. This man had diarrhea July 10 and 11; diarrhea July 30 to August 4; intermittent malaria August 23 and 24, and was granted sick leave August 29.

No. 154. Typhoid fever September 9; sent to Long Island Hospital September 9; returned to duty September 16. This man had diarrhea August 30 to September 9.

No. 155. Typhoid fever, September 9; sent to St. Luke's Hospital September 9; returned to duty September 14. This man had diarrhea August 20 to 22, and remittent malaria August 22 to 27.

No. 156. Typhoid fever, September 9; sent to Mount Sinai Hospital September 9.

No. 157. Typhoid fever, September 9; sent to German Hospital September 9.

No. 158. Typhoid fever, September 9; sent to Metropolitan Hospital September 9. This man had diarrhea July 14 to 21; diarrhea August 2 to 6; remittent malaria August 6, and was granted sick leave August 27. The initial date of this typhoid fever was probably August 2.

No. 159. Typhoid fever, September 9; sent to Bellevue Hospital September 9. This man had remittent malaria July 31 to August 31.

No. 160. Typhoid fever, September 9; sent to Bellevue Hospital September 9. This man had intermittent malaria August 29 to September 9.

No. 161. Typhoid fever, September 9; sent to Bellevue Hospital September 9. This man had intermittent malaria August 6 to 13; intermittent malaria August 25; was granted sick leave August 29.

No. 162. Typhoid fever, September 9; sent to New York Hospital September 9; returned to duty September 21. This man had

diarrhea July 17 to 19; diarrhea July 26 to 29; intermittent malaria July 29 to August 27.

No. 163. Typhoid fever, September 9; sent to Long Island Hospital September 9; returned to duty September 21. This man had diarrhea July 11 to 14; diarrhea July 16 to 24.

No. 164. Typhoid fever, September 9; sent to Mount Sinai Hospital September 9.

No. 165. Typhoid fever, September 9; sent to Mount Sinai Hospital September 9. This man had diarrhea July 11 and 12; diarrhea July 31 to August 4.

No. 166. Typhoid fever, September 9; sent to German Hospital September 9.

No. 167. Typhoid fever, September 9; sent to Bellevue Hospital September 9.

No. 168. Typhoid fever, September 9; sent to Bellevue Hospital September 9. This man had remittent malaria September 6 to 9.

No. 169. Typhoid fever, September 9; sent to German Hospital September 9. This man had diarrhea August 15 to 17.

No. 170. Typhoid fever, August 15; sent to Sternberg Hospital August 15; furloughed October 15.

No. 171. Typhoid fever, July 11; sent to division hospital July 11; sent to Fort McPherson, without date.

No. 172. Typhoid fever, August 16; sent to division hospital August 16; sent to Sternberg Hospital August 30.

No. 173. Remittent malaria, July 31; sent to Sternberg Hospital August 30. Here the disease was diagnosed typhoid fever, and the patient died September 5.

No. 174. Intermittent malaria, August 11; sent to division hospital August 11. Here the disease was diagnosed typhoid fever, and the patient remained on sick report August 31.

No. 175. Intermittent malaria, August 4; patient was sent to division hospital without date. Here the disease was diagnosed typhoid fever, and the patient was furloughed October 6.

No. 176. Intermittent malaria, July 28; sent to Leiter Hospital August 2. Here the disease was diagnosed typhoid fever; the patient was sent to Bellevue Hospital September 9, and was returned to duty September 20.

No. 177. Remittent malaria, August 2; patient was sent to division hospital without date. Here the disease was diagnosed typhoid fever, and the man was furloughed September 6.

No. 178. Remittent malaria, August 17; sent to division hospital without date. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 5.

No. 179. Remittent malaria, August 18; sent to division hospital without date. Here the disease was diagnosed typhoid fever, and the man was furloughed September 5.

No. 180. Typhoid fever, September 5; sent to Sternberg Hospital September 5; died September 12.

No. 181. Remittent malaria, August 6; sent to division hospital without date. Here the disease was diagnosed typhoid fever, and the patient was returned to duty September 21.

No. 182. Typhoid fever, August 18; patient sent to Sternberg Hospital August 18; furloughed September 5.

No. 183. Intermittent malaria, July 26; sent to Sternberg Hospital August 31. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 6.

No. 184. Remittent malaria, August 15; sent to division hospital without date. Here the disease was diagnosed typhoid fever, and the patient was furloughed October 25.

No. 185. Typhoid fever, without date; sent to Sternberg Hospital August 30. Here the disease was diagnosed typhoid fever, and the disposition of the patient is not given.

No. 186. Remittent malaria, August 1; sent to Bellevue Hospital September 9. Here the disease was diagnosed typhoid fever.

No. 187. Typhoid fever, July 18; disposition not given.

No. 188. Typhoid fever, September 9; sent to Long Island Hospital September 12.

No. 189. Typhoid fever, July 16 to August 5.

No. 190. Typhoid fever, July 22; disposition not given.

It must not be supposed that September 9 was the initial date of many of these cases of typhoid fever. Inspection of the above figures will show that typhoid fever was not recognized in many cases until the patients reached the New York hospitals, and many of them were convalescent at the time of their admission to these hospitals.

The following is a list of the probable cases of typhoid fever which were not diagnosed as such either in the regiment or in hospital:

No. 1. Remittent malaria, July 29; furloughed August 27.

No. 2. Remittent malaria, July 23; furloughed August 5.

No. 3. Intermittent malaria, July 30; returned to duty August 26.

No. 4. Diarrhea, August 1; returned to duty August 19.

No. 5. Remittent malaria, August 3; furloughed August 29.

No. 6. Remittent malaria, August 10; furloughed August 22.

No. 7. Intermittent malaria, August 12; furloughed August 31.

No. 8. Intermittent malaria, August 15; furloughed August 29.

No. 9. Intermittent malaria, August 16; furloughed August 27.

No. 10. Remittent malaria, August 16; furloughed August 31.

No. 11. Intermittent malaria, August 17; furloughed August 29.

No. 12. Intermittent malaria, August 20; sick September 10.

This man had diarrhea July 15 to 23.

No. 13. Intermittent malaria, August 21; furloughed August 29.

No. 14. Remittent malaria, August 21; furloughed August 29.

This man had diarrhea August 20.

No. 15. Intermittent malaria, August 22; furloughed August 29.

No. 16. Intermittent malaria, August 21; furloughed August 29.

This man had intermittent malaria, July 31, and the record is left incomplete.

No. 17. Intermittent malaria, August 23; furloughed August 29.

No. 18. Diarrhea, August 25; returned to duty September 16.

No. 19. Intermittent malaria, August 29; returned to duty September 23.

No. 20. Intermittent malaria, August 29; returned to duty September 16. This man had intermittent malaria July 4 to 6.

No. 21. Diarrhea, August 31; returned to duty September 23.

No. 22. Diarrhea, June 18; still sick July 31; no report after this date. This man had diarrhea May 26 and 27.

No. 23. Intermittent malaria, without date; sent to division hospital July 13; returned to duty August 5.

No. 24. Remittent malaria, without date; sent to division hospital August 19; furloughed August 26.

No. 25. Remittent malaria, without date; sent to division hospital August 20; furloughed August 30.

No. 26. Intermittent malaria, August 18; furloughed August 29.

No. 27. Intermittent malaria, August 18; furloughed August 29.

No. 28. Intermittent malaria, August 20; furloughed August 29.

No. 29. Intermittent malaria, August 20; furloughed August 29.

No. 30. Intermittent malaria, August 8; furloughed August 29.

No. 31. Diarrhea, July 28; returned to duty August 22.

No. 32. Intermittent malaria, July 30; furloughed August 29.

No. 33. Diarrhea, July 30; returned to duty August 14. This man had diarrhea July 15 and 16; dysentery July 22 to 27.

No. 34. Remittent malaria, August 1; furloughed August 29.

No. 35. Intermittent malaria, August 6; furloughed August 29.

No. 36. Intermittent malaria, August 9; furloughed August 29.

No. 37. Intermittent malaria, August 11; furloughed August 29.

No. 38. Intermittent malaria, August 12; furloughed August 29.

No. 39. Intermittent malaria, August 12; returned to duty September 21.

No. 40. Intermittent malaria, August 23; returned to duty September 16.

No. 41. Intermittent malaria, August 29; returned to duty September 16.

No. 42. Intermittent malaria, August 29; returned to duty September 17.

- No. 43. Diarrhea, August 29; returned to duty September 21.
 No. 44. Diarrhea, August 29; returned to duty September 15.
 No. 45. Intermittent malaria, July 30; furloughed August 29.
 No. 46. Diarrhea, July 16 to 18; diarrhea, July 30 to August 2; intermittent malaria, August 4 to 16; remittent malaria, August 16; granted sick leave August 31.
 No. 47. Intermittent malaria, July 31 to August 5; remittent malaria, August 5; granted sick leave August 31.
 No. 48. Intermittent malaria, July 31 to August 13; diarrhea, August 14; still sick August 31.
 No. 49. Diarrhea, July 18 and 19; diarrhea, August 3 to 8; intermittent malaria, August 9; granted sick leave August 27.
 No. 50. Diarrhea, August 12 to 18; remittent malaria, August 18; furloughed August 22.
 No. 51. Intermittent malaria, August 15 to 31.
 No. 52. Intermittent malaria, August 17; furloughed August 31.
 No. 53. Diarrhea, June 7 to 14; intermittent malaria, June 15 to 19; intermittent malaria, June 24 to 29; intermittent malaria, July 1 to 4.
 No. 54. Intermittent malaria, September 4 to 14.
 No. 55. Intermittent malaria, August 4 to 10; remittent malaria, August 10; furloughed August 27.
 No. 56. Intermittent malaria, August 4 to 11; diarrhea, August 16 to 27; malaria, August 27 to September 15.
 No. 57. Intermittent malaria, July 13 to 17; diarrhea, July 18 to 22; intermittent fever, August 9 to 14; diarrhea, August 19; granted sick leave August 29.
 No. 58. Diarrhea, August 14 to 16; remittent malaria, August 16; granted sick leave August 31; sent to Harlem Hospital with malaria September 9.
 No. 59. Intermittent malaria, June 11 to 22.
 No. 60. Intermittent malaria, June 29 to July 6; gastritis, July 14 to August 2.
 No. 61. Diarrhea, August 1 and 2; remittent malaria, August 12 to 22; diarrhea, August 22 to 25.
 No. 62. Diarrhea, August 5 to 8; diarrhea, August 9 to 11; diarrhea, August 11 to September 6.
 No. 63. Diarrhea, July 24 to 26; intermittent malaria, August 6 to 10; remittent malaria, August 10; granted sick leave August 27.
 No. 64. Intermittent malaria, August 9 to 13; remittent malaria, August 13; granted sick leave August 29.
 No. 65. Diarrhea, August 16 to 19; intermittent malaria, August 24; granted sick leave August 29.
 No. 66. Intermittent malaria, August 18; granted sick leave August 29.
 No. 67. Remittent malaria, without date; sent to division hospital August 13; granted sick leave August 22.
 No. 68. Remittent malaria, without date; sent to division hospital August 16; furloughed August 24.
 No. 69. Remittent malaria, without date; sent to division hospital August 21; furloughed August 27.
 No. 70. Diarrhea, July 29 to August 12; remittent malaria, August 13; granted sick leave August 31.
 No. 71. Diarrhea, July 30 to August 15; diarrhea, August 16 and 17.
 No. 72. Intermittent malaria, August 9 to 14; remittent malaria, August 14 to 27.
 No. 73. Intermittent malaria, August 17; granted sick leave August 29.
 No. 74. Diarrhea, August 26 to 28; intermittent malaria, August 31 to September 17.
 No. 75. Intermittent malaria, August 29 to September 16.
 No. 76. Intermittent malaria, August 29 to September 15.
 No. 77. Remittent malaria, without date; sent to division hospital August 16; granted sick leave August 30.
 No. 78. Intermittent malaria, July 31 to August 28.
 No. 79. Diarrhea, July 31 to August 6; remittent malaria, August 6 to 14.
 No. 80. Intermittent malaria, August 9 to 27; diarrhea, August 29 and 30.
 No. 81. Intermittent malaria, August 9 to 14; remittent malaria, August 14; granted sick leave August 29.
 No. 82. Intermittent malaria, August 13 to 26.
 No. 83. Diarrhea, August 16 and 17; intermittent malaria, August 19; granted sick leave August 29.
 No. 84. Remittent malaria, August 16; granted sick leave August 31.
 No. 85. Diarrhea, August 17 to 19; remittent malaria, August 19; sent to Bellevue Hospital September 8.
 No. 86. Intermittent malaria, August 18; granted sick leave August 29.
 No. 87. Diarrhea, August 18 and 19; diarrhea, August 24 and 25; diarrhea, August 29 and 30.
 No. 88. Diarrhea, May 26 to 28; intermittent malaria, August 21 to 28; intermittent malaria, August 29 to September 15.
 No. 89. Intermittent malaria, August 3 to 13; intermittent malaria, August 13; granted sick leave August 29.
 No. 90. Diarrhea, August 29 to September 12.
 No. 91. Intermittent malaria, August 30 to September 14.
 No. 92. Continued malaria, without date; sent to Sternberg Hospital, September 5; furloughed September 23.
 No. 93. Remittent malaria, without date; sent to division hospital August 16; furloughed August 23.
 No. 94. Gastritis, July 29 to August 2; remittent malaria, August 4 to 6; remittent malaria, August 6 to 19.
 No. 95. Diarrhea, August 2 to 6; remittent malaria, August 6 to 19.
 No. 96. Intermittent malaria, August 11 to 16; remittent malaria, August 16 to 22.
 No. 97. Intermittent malaria, August 14; still sick August 31. There is no further record of this man.
 No. 98. Intermittent malaria, August 22 to 28; intermittent malaria, August 29 to September 15.
 No. 99. Intermittent malaria, August 29 to September 17.
 No. 100. Diarrhea, August 19; sent to division hospital August 20. Here the disease was diagnosed remittent malaria, and the patient was furloughed August 27.
 No. 101. Diarrhea, August 20 and 21; remittent malaria, August 21; granted sick leave August 27.
 No. 102. Diarrhea, August 20 and 21; intermittent malaria August 22; granted sick leave August 29.
 No. 103. Diarrhea, August 23 to 25; intermittent malaria, August 29 to September 20.
 No. 104. Diarrhea, August 29 to September 12.
 No. 105. Intermittent malaria, August 29 to September 10.
 No. 106. Intermittent malaria, August 31 to September 15.
 No. 107. Diarrhea, July 14 and 15; diarrhea, July 30 to August 4; intermittent malaria, August 6 to 17; intermittent malaria, August 21; granted sick leave August 29.
 No. 108. Intermittent malaria, July 31 to August 6; remittent malaria, August 6; granted sick leave August 29.
 No. 109. Diarrhea, August 11 to 14; remittent malaria August 16; granted sick leave August 31.
 No. 110. Remittent malaria, August 11; granted sick leave August 27.
 No. 111. Diarrhea, August 15 to 19; intermittent malaria, August 22; granted sick leave August 29.
 No. 112. Diarrhea, August 14 to 16; sent to division hospital August 16. Here the diagnosis was changed to remittent malaria. The patient was returned to duty August 26.
 No. 113. Diarrhea, July 21 to 25; diarrhea, July 30 to August 8; intermittent malaria, August 17; granted sick leave August 29.
 No. 114. Diarrhea, June 1 to 3; intermittent malaria, July 31 to August 22.
 No. 115. Remittent malaria, August 16 to September 19.
 No. 116. Diarrhea, August 7 to 10; remittent malaria, August 10; granted sick leave August 31.

No. 117. Intermittent malaria, August 9 to 13; diarrhea, August 19 to 21; remittent malaria, August 21; granted sick leave August 27.

No. 118. Diarrhea, August 9 and 10; diarrhea, August 16 to 19; intermittent malaria, August 22; granted sick leave August 29.

No. 119. Intermittent malaria, August 9 to 17; intermittent malaria, August 21; granted sick leave August 29.

No. 120. Remittent malaria, August 14; granted sick leave August 31; reported still sick in New York September 16.

No. 121. Intermittent malaria, August 30 to September 17.

No. 122. Remittent malaria, September 3 to 14.

No. 123. Diarrhea, August 5 and 6; sent to division hospital August 6. Here the diagnosis was changed to malaria. Returned to duty August 22.

No. 124. Intermittent malaria, August 10 to 16; remittent malaria, August 16 to 22; sent to Harlem Hospital with malaria September 9.

No. 125. Intermittent malaria, August 13 to 18; remittent malaria, August 21; granted sick leave August 27.

No. 126. Remittent malaria, August 14 to 27.

No. 127. Remittent malaria, August 16; granted sick leave August 31.

No. 128. Remittent malaria, August 29 and 30; remittent malaria, September 4 to 15.

No. 129. Intermittent malaria, August 25 to September 16.

No. 130. Intermittent malaria, August 27 to September 19.

No. 131. Intermittent malaria, July 31 to August 13. This man had constipation from July 27 to 31.

No. 132. Diarrhea, July 31 to August 10; intermittent malaria, August 10 to 22.

No. 133. Intermittent malaria, August 3 to 11; remittent malaria, August 11; granted sick leave August 29.

No. 134. Intermittent malaria, August 5 to 10; remittent malaria, August 10 to 28.

No. 135. Intermittent malaria, August 6 to 31; remittent malaria, September 9 to 12.

No. 136. Intermittent malaria, August 6 to 21.

No. 137. Diarrhea, August 7 to 10; remittent malaria, August 10 to 22.

No. 138. Diarrhea, August 7 to 10; remittent malaria, August 10 to 22.

No. 139. Intermittent malaria, August 10 to 22; remittent malaria, August 22 to 27.

No. 140. Intermittent malaria, August 8; granted sick leave August 29.

No. 141. Intermittent malaria, August 8 to 13; remittent malaria, August 13 to 23.

No. 142. Malaria, July 13 to 30.

No. 143. Diarrhea, July 26 to August 1; intermittent malaria, August 3 to 7; intermittent malaria, August 10 to 22; sent to Sternberg Hospital August 31.

No. 144. Intermittent malaria, August 14 to 19; remittent malaria, August 19; granted sick leave August 27.

No. 145. Intermittent malaria, August 1 to 16.

No. 146. Intestinal colic, August 18 and 19; intermittent malaria, August 20; granted sick leave August 29.

No. 147. Diarrhea, August 25 and 26; intermittent malaria, August 29 to September 18.

No. 148. Intermittent malaria, July 16 to 26.

No. 149. Intermittent malaria, June 21 to 25; intermittent malaria, June 29 to July 3; diarrhea, July 3 to August 13; remittent malaria, August 14 to 17.

No. 150. Intermittent malaria, July 31; died (no date given).

No. 151. Diarrhea, August 29 to September 9; malaria, September 9; sent to St. Luke's Hospital September 28.

No. 152. Diarrhea, July 22 to 24; intermittent malaria, August 17; granted sick leave August 29.

No. 153. Intermittent malaria, August 29 to September 15.

No. 154. Remittent malaria, August 5 to 16.

No. 155. Intermittent malaria, August 6 to 10; remittent malaria, August 10 to 16.

No. 156. Intermittent malaria, August 7 to 25; diarrhea, September 1 to 3.

No. 157. Diarrhea, August 9 to 13; remittent malaria, August 13; granted sick leave August 27.

No. 158. Intermittent malaria, August 28 to September 15.

No. 159. Intermittent malaria, August 22 to 28; remittent malaria, August 29 to September 14.

No. 160. Intermittent malaria, August 31 to September 20.

No. 161. Intermittent malaria, July 15 to August 21.

No. 162. Diarrhea, July 12 to 24; intermittent malaria, July 30 to August 13.

No. 163. Diarrhea, July 30 to August 5; diarrhea, August 7 to 12.

No. 164. Diarrhea, May 21 to 23; intermittent malaria, July 8 to 22; intermittent malaria, July 31; died August 23.

No. 165. Diarrhea, July 15 and 16; gastro-enteritis, July 25 to 27; diarrhea, August 5 and 6; diarrhea, August 10 to 14; remittent malaria, August 14; granted sick leave August 31.

No. 166. Diarrhea, August 5 and 6; remittent malaria, August 6; granted sick leave August 28.

No. 167. Diarrhea, August 9 and 10; diarrhea, August 16 to 19; remittent malaria, August 19 to 21.

No. 168. Remittent malaria, August 10 to 22.

No. 169. Remittent malaria, August 14; granted sick leave August 29.

No. 170. Intermittent malaria, June 26 to 28; remittent malaria, August 6 to 14; remittent malaria, August 16; granted sick leave August 27.

No. 171. Intermittent malaria, August 29 to September 20.

No. 172. Intermittent malaria, August 30 to September 17.

No. 173. Intermittent malaria, August 31 to September 25.

No. 174. Diarrhea, July 11 to 24.

No. 175. Diarrhea, July 12 to 24.

No. 176. Intermittent malaria, August 25 to September 20.

No. 177. Intermittent malaria, July 13 to 27.

No. 178. Intermittent malaria, August 8; granted sick leave August 29.

No. 179. Diarrhea, August 10 and 11; remittent malaria, August 13; granted sick leave August 31.

No. 180. Diarrhea, August 29 to September 24.

No. 181. Diarrhea, August 4 to 15; diarrhea, August 16 to 19; remittent malaria, August 20; granted sick leave August 29.

No. 182. Diarrhea, August 5 and 6; remittent malaria, August 6 to 23.

No. 183. Diarrhea, August 5 and 6; remittent malaria, August 6 to 27.

No. 184. Diarrhea, August 18 and 19; intermittent malaria, September 3 to 18.

No. 185. Diarrhea, August 4 to 6; remittent malaria, August 6; granted sick leave August 29; died September 26.

No. 186. Remittent malaria, August 8; granted sick leave August 29.

No. 187. Remittent malaria, August 14; granted sick leave August 29.

We will now proceed to give a complete list of all individuals found on the sick reports of this regiment not already given in the above lists. These are as follows:

No. 1. Intestinal colic, June 1 to 5.

No. 2. Gastro-enteritis, June 5 to 7.

No. 3. Cystitis, June 18 to 27.

No. 4. Diarrhea, July 12 to 14.

No. 5. Diarrhea, July 14 and 15; diarrhea, July 16 to 23.

No. 6. Intermittent malaria, July 15 and 16.

No. 7. Diarrhea, July 20 to 28.

No. 8. Constipation, July 28 and 29; diarrhea, July 30; incomplete.

- No. 9. Diarrhea, July 12; incomplete.
- No. 10. Intermittent malaria, July 23; incomplete.
- No. 11. Diarrhea, June 1 and 2.
- No. 12. Dysentery, June 2 to 5.
- No. 13. Gastro-enteritis, June 11 and 12.
- No. 14. Diarrhea, June 11 to 13.
- No. 15. Intermittent malaria, June 26 and 27; intermittent malaria, June 28 to July 2.
- No. 16. Rheumatism, June 18 to July 23.
- No. 17. Gastritis, July 10 to 17.
- No. 18. Gastritis, July 10 to 17.
- No. 19. Diarrhea, July 15 and 16.
- No. 20. Diarrhea, July 15 and 16.
- No. 21. Diarrhea, July 24 to 27.
- No. 22. Gastro-enteritis, July 30 and 31.
- No. 23. Diarrhea, June 8 and 9.
- No. 24. Intermittent malaria, June 8 and 9.
- No. 25. Intestinal colic, June 18 to 26; gastro-enteritis, June 29 to July 2.
- No. 26. Intermittent malaria, July 11 to 23.
- No. 27. Diarrhea, July 11 to 15.
- No. 28. Diarrhea, July 15 and 16.
- No. 29. Heat exhaustion, May 21 and 22.
- No. 30. Diarrhea, July 20 and 21.
- No. 31. Dysentery, May 31 and June 1.
- No. 32. Gastro-enteritis, June 1 to 3.
- No. 33. Heat exhaustion, June 3 to 5.
- No. 34. Diarrhea, June 6 and 7.
- No. 35. Intermittent malaria, June 23 to 26.
- No. 36. Diarrhea, July 12 to 18.
- No. 37. Diarrhea, July 15 and 16.
- No. 38. Diarrhea, July 22 and 23.
- No. 39. Diarrhea, July 25 to 27.
- No. 40. Diarrhea, July 22 to 24.
- No. 41. Diarrhea, May 20 to 22; intermittent malaria, September 5 to 15.
- No. 42. Diarrhea, May 26 and 27.
- No. 43. Gastro-enteritis, June 3 to 5.
- No. 44. Pleurodynia, June 7 to 10.
- No. 45. Heat exhaustion, June 26 to 28; diarrhea, July 14 to 17.
- No. 46. Diarrhea, July 10 to 14.
- No. 47. Gastritis, July 1 to 12; intermittent malaria, September 4 to 10.
- No. 48. Diarrhea, July 12 to 14; diarrhea, July 15 and 16.
- No. 49. Diarrhea, July 15 and 16.
- No. 50. Diarrhea, July 16 and 17.
- No. 51. Intermittent malaria, May 27 and 28.
- No. 52. Indigestion, May 27 to 30.
- No. 53. Diarrhea, June 13 and 14.
- No. 54. Diarrhea, July 12 and 13.
- No. 55. Diarrhea, July 15 and 16.
- No. 56. Diarrhea, July 15 and 16.
- No. 57. Bronchitis, July 22 to 26.
- No. 58. Diarrhea, July 22 and 23.
- No. 59. Intermittent malaria, July 26 and 27.
- No. 60. Rheumatism, July 30; left incomplete.
- No. 61. Heat exhaustion, June 1 to 4.
- No. 62. Diarrhea, July 16 to 24.
- No. 63. Intermittent malaria, July 23 to 28.
- No. 64. Diarrhea, July 31; left incomplete.
- No. 65. Enteritis, May 28 and 29.
- No. 66. Diarrhea, July 14 and 15.
- No. 67. Diarrhea, July 16 to 23.
- No. 68. Gastro-enteritis, July 18 to 24.
- No. 69. Diarrhea, July 19 to 27.
- No. 70. Heat exhaustion, May 26 and 27.
- No. 71. Dysentery, May 31 and June 1.
- No. 72. Intermittent malaria, June 9 and 10; diarrhea, July 22 and 23.
- No. 73. Neuralgia, June 13 to 17; diarrhea, September 3 to 6.
- No. 74. Gastritis, June 13 to 15.
- No. 75. Diarrhea, July 10 to 14.
- No. 76. Diarrhea, July 11 and 12.
- No. 77. Diarrhea, July 20 to 27.
- No. 78. Diarrhea, July 27 and 28.
- No. 79. Diarrhea, July 30 and 31.
- No. 80. Intermittent malaria, July 31; left incomplete.
- No. 81. Heat exhaustion, May 20 and 21.
- No. 82. Heat exhaustion, June 6 and 7.
- No. 83. Gastro-enteritis, June 21 to 27.
- No. 84. Diarrhea, July 3 to 5.
- No. 85. Diarrhea, July 14 to 17.
- No. 86. Diarrhea, July 15 and 16; intermittent malaria, July 28; left incomplete.
- No. 87. Diarrhea, July 15 and 16.
- No. 88. Gastro-enteritis, July 25 and 26.
- No. 89. Constipation, July 27 to 31.
- No. 90. Heat exhaustion, July 25; left incomplete.
- No. 91. Gastro-enteritis, July 29; left incomplete.
- No. 92. Diarrhea, July 29; left incomplete.
- No. 93. Intermittent malaria, July 31; left incomplete.
- No. 94. Diarrhea, July 31; left incomplete.
- No. 95. Diarrhea, May 31 and June 1.
- No. 96. Intermittent malaria, June 8 and 9; intermittent malaria, June 11 and 12.
- No. 97. Diarrhea, July 16 and 17.
- No. 98. Intermittent malaria, July 25 to 29.
- No. 99. Diarrhea, July 27 and 28.
- No. 100. Diarrhea, July 31; left incomplete.
- No. 101. Heat exhaustion, May 26 and 27.
- No. 102. Diarrhea, June 2 to 5.
- No. 103. Intermittent malaria, June 26 to 28.
- No. 104. Intermittent malaria, July 14 to 16.
- No. 105. Intermittent malaria, July 16 to 26.
- No. 106. Gastro-enteritis, May 28 and 29.
- No. 107. Diarrhea, July 12 to 14.
- No. 108. Diarrhea, July 14 and 15; intermittent malaria, July 16 to 18.
- No. 109. Diarrhea, July 16 and 17; rheumatism, July 17 to 23.
- No. 110. Diarrhea, May 26 and 27; heat exhaustion, May 31 to June 3.
- No. 111. Bronchitis, May 29 to 31.
- No. 112. Diarrhea, June 5 and 6.
- No. 113. Hemorrhage, June 15 to 17.
- No. 114. Neuritis, June 24 to July 21.
- No. 115. Intestinal colic, July 24 to 26.
- No. 116. Bronchitis, June 1 and 2.
- No. 117. Pernicious anæmia, June 5 to 10.
- No. 118. Intermittent malaria, June 11 and 12.
- No. 119. Diarrhea, June 23 to 25.
- No. 120. Intestinal colic, June 11 and 12.
- No. 121. Diarrhea, July 12 and 13; hemorrhage, July 25 to 27. The source of this hemorrhage is not given.
- No. 122. Hemorrhage, July 15 to 17.
- No. 123. Diarrhea, July 15 and 16.
- No. 124. Intermittent malaria, July 16 to 18.
- No. 125. Constipation, July 15 to 17.
- No. 126. Sunburn, June 20 to 23.
- No. 127. Intestinal colic, July 21 and 22.
- No. 128. Migraine, July 22 and 23.
- No. 129. Rheumatism, July 21; left incomplete.
- No. 130. Diarrhea, July 30; left incomplete.
- No. 131. Diarrhea, June 1 to 3.
- No. 132. Inebriety, July 10 and 11; remittent malaria, September 6 to 16.
- No. 133. Gastritis, July 13 to 26.
- No. 134. Cellulitis, July 15 and 16.
- No. 135. Diarrhea, July 26 and 27.

- No. 136. Diarrhea, July 14 and 15.
 No. 137. Diarrhea, June 3 and 4; diarrhea, September 3 to 5.
 No. 138. Intermittent malaria, June 4 to 10.
 No. 139. Bronchitis, June 11 and 12.
 No. 140. Flux, July 3 to 16.
 No. 141. Diarrhea, July 11 to 14.
 No. 142. Lumbago, July 28 and 29; diarrhea, August 4 to 6.
 No. 143. Dysentery, August 31 to September 2.
 No. 144. Diarrhea, July 27 to August 1.
 No. 145. Diarrhea, July 30 to August 4.
 No. 146. Intermittent malaria, July 31 to August 8.
 No. 147. Diarrhea, August 1 and 2; diarrhea, August 8 and 9.
 No. 148. Diarrhea, August 1 and 2; sent to Bellevue Hospital September 9 with remittent malaria.
 No. 149. Intermittent malaria, August 6 to 16.
 No. 150. Dysentery, August 6 to 11.
 No. 151. Intermittent malaria, August 7 to 13.
 No. 152. Diarrhea, August 8 to 13.
 No. 153. Carbuncle, July 4 and 5; diarrhea, July 12 to 14.
 No. 154. Gastro-enteritis, June 13 to 15; diarrhea, August 17 to 19.
 No. 155. Diarrhea, August 18 and 19.
 No. 156. Intermittent malaria, August 19 to 22.
 No. 157. Remittent malaria, August 19 to 22.
 No. 158. Remittent malaria, August 19 to 22.
 No. 159. Intermittent malaria, August 19 to 25.
 No. 160. Diarrhea, August 20 to 22.
 No. 161. Diarrhea, August 20 and 21.
 No. 162. Dysentery, August 21 to 25.
 No. 163. Intermittent malaria, August 21 to 25.
 No. 164. Remittent malaria, August 21 and 22.
 No. 165. Diarrhea, August 21 and 22.
 No. 166. Diarrhea, August 24 and 25.
 No. 167. Diarrhea, August 25 and 26.
 No. 168. Colic, August 25 to 27.
 No. 169. Diarrhea, August 25 to 27.
 No. 170. Intermittent malaria, August 27 to 30.
 No. 171. Diarrhea, August 27 and 28.
 No. 172. Remittent malaria, August 10; disposition not given in either August or September report.
 No. 173. Diarrhea, August 30 to September 2.
 No. 174. Diarrhea, August 31 to September 3.
 No. 175. Diarrhea, May 29 and 30.
 No. 176. Diarrhea, May 31; left incomplete.
 No. 177. Malarial fever, May 31 to June 4.
 No. 178. Diarrhea, August 29 to September 9.
 No. 179. Dysentery, September 3 to 7.
 No. 180. Dysentery, September 6 to 10.
 No. 181. Diarrhea, July 30 to August 2.
 No. 182. Diarrhea, July 30 to August 5.
 No. 183. Intermittent malaria, July 31 to August 5.
 No. 184. Diarrhea, July 31 to August 7.
 No. 185. Diarrhea, July 31 to August 5.
 No. 186. Diarrhea, August 1 and 2; intestinal colic, August 2 to 6; diarrhea, August 26 and 27.
 No. 187. Diarrhea, June 2 to 5; diarrhea, August 1 to 6; diarrhea, September 3 to 5.
 No. 188. Intestinal colic, August 5 to 15.
 No. 189. Diarrhea, August 8 to 10.
 No. 190. Diarrhea, August 10 to 12.
 No. 191. Diarrhea, August 11 and 12.
 No. 192. Diarrhea, June 13 and 14; diarrhea, August 3 and 14.
 No. 193. Diarrhea, July 16 and 17; diarrhea, August 14; deserted August 24.
 No. 194. Diarrhea, August 14 to 16.
 No. 195. Remittent malaria, August 19 to 22.
 No. 196. Diarrhea, August 20 and 21.
 No. 197. Pernicious malaria, August 21 to 25.
 No. 198. Diarrhea, August 22 to 25.
 No. 199. Intermittent malaria, August 22 to 29.
 No. 200. Intermittent malaria, August 23 to 25.
 No. 201. Diarrhea, August 31 to September 6.
 No. 202. Intermittent malaria, August 23; granted sick leave August 29.
 No. 203. Diarrhea, August 24 and 25.
 No. 204. Diarrhea, August 24 and 25.
 No. 205. Diarrhea, August 26 and 27.
 No. 206. Diarrhea, August 26; granted sick leave August 29.
 No. 207. Diarrhea, August 23 and 24; diarrhea, August 27 and 28; diarrhea, August 29 and 30; diarrhea, August 31; left incomplete.
 No. 208. Diarrhea, August 27 and 28; intermittent malaria, September 1 to 10.
 No. 209. Intermittent malaria, August 28; granted sick leave August 31.
 No. 210. Remittent malaria, August 6; left incomplete.
 No. 211. Intermittent malaria, August 26 to September 9.
 No. 212. Diarrhea, August 31 to September 2.
 No. 213. Diarrhea, September 4 to 7.
 No. 214. Remittent malaria, July 29 to August 3.
 No. 215. Intermittent malaria, July 30 to August 2.
 No. 216. Intermittent malaria, July 31 to August 5.
 No. 217. Diarrhea, August 1 and 2.
 No. 218. Diarrhea, August 8 to 10.
 No. 219. Diarrhea, August 8 to 10.
 No. 220. Diarrhea, August 8 to 17.
 No. 221. Diarrhea, August 8 to 11.
 No. 222. Diarrhea, August 12 to 15.
 No. 223. Diarrhea, August 13 and 14.
 No. 224. Intermittent malaria, August 14 to 19; diarrhea, August 20 and 21.
 No. 225. Intermittent malaria, August 15 to 22; diarrhea, August 27 to 30.
 No. 226. Diarrhea, August 18 and 19.
 No. 227. Diarrhea, August 18 and 19.
 No. 228. Diarrhea, August 20 and 21; intermittent malaria, August 25 to 28.
 No. 229. Diarrhea, August 20 to 22.
 No. 230. Intermittent malaria, August 21; granted sick leave August 29.
 No. 231. Diarrhea, August 22 to 24.
 No. 232. Intermittent malaria, August 22 to 26.
 No. 233. Diarrhea, August 23 to 25.
 No. 234. Constipation, July 11 to 14; diarrhea, August 23 to 25.
 No. 235. Intermittent malaria, August 23; granted sick leave August 29.
 No. 236. Diarrhea, July 24 and 25; diarrhea, August 23 to 25.
 No. 237. Diarrhea, August 24 to 26.
 No. 238. Diarrhea, August 24 and 25.
 No. 239. Diarrhea, August 26 and 27.
 No. 240. Intermittent malaria, August 26 and 27.
 No. 241. Nephritis, July 30; left incomplete; intermittent malaria, August 27; granted sick leave August 29.
 No. 242. Diarrhea, July 28 and 29; intermittent malaria, August 26 to September 8.
 No. 243. Intermittent malaria, August 28; left incomplete.
 No. 244. Intestinal colic, August 30 to September 4.
 No. 245. Intermittent malaria, August 28 to September 18.
 No. 246. Remittent malaria, September 3 to 10.
 No. 247. Diarrhea, September 5 to 9.
 No. 248. Intermittent malaria, July 30 to August 2.
 No. 249. Appendicitis, July 31 to August 2; diarrhea, August 24 and 25.
 No. 250. Diarrhea, August 2 and 3.
 No. 251. Intermittent malaria, August 6 to 10.
 No. 252. Diarrhea, August 6 to 8.
 No. 253. Intermittent malaria, August 16 to 25; hysteria, August 25 to 31; diarrhea, September 5 to 8.

- No. 254. Diarrhea, August 24 and 25.
 No. 255. Diarrhea, August 24 and 25.
 No. 256. Diarrhea, August 25 and 26; dysentery, September 4 to 7.
 No. 257. Diarrhea, September 1 to 5.
 No. 258. Diarrhea, September 2 to 5.
 No. 259. Intermittent malaria, June 8 and 9; diarrhea, July 16 to 19; diarrhea, August 2 to 7.
 No. 260. Diarrhea, July 30 to August 2.
 No. 261. Diarrhea, June 11 to 14; diarrhea, July 31 to August 5; heat exhaustion, August 12 to 22.
 No. 262. Diarrhea, August 2 to 4; diarrhea, August 12 and 13.
 No. 263. Diarrhea, August 14 to 16.
 No. 264. Diarrhea, August 14 and 15.
 No. 265. Remittent malaria, August 16 to 21.
 No. 266. Diarrhea, August 17 to 19.
 No. 267. Diarrhea, August 20 and 21; sent to Bellevue Hospital with malaria, September 17.
 No. 268. Heat exhaustion, June 4 and 5; gastritis, July 18 to 21; myalgia, August 21 and 22.
 No. 269. Intestinal colic, July 18 to 20; intermittent malaria, August 22; granted sick leave, August 29.
 No. 270. Remittent malaria, August 22; granted sick leave August 31.
 No. 271. Intermittent malaria, August 24; granted sick leave August 29.
 No. 272. Intermittent malaria, August 25 to 28.
 No. 273. Diarrhea, August 25 and 26.
 No. 274. Dysentery, September 3 to 7.
 No. 275. Diarrhea, September 4 and 5.
 No. 276. Sent to St. Peter's Hospital September 9 with malaria.
 No. 277. Diarrhea, July 30 to August 2; malaria, September 9 to 16.
 No. 278. Diarrhea, August 4 and 5; diarrhea, August 22 and 23; malaria, September 4 to 14.
 No. 279. Diarrhea, August 5 to 7.
 No. 280. Intermittent malaria, August 1 to 13.
 No. 281. Remittent malaria, August 6 to 15.
 No. 282. Diarrhea, August 11 and 12.
 No. 283. Diarrhea, August 11 to 13.
 No. 284. Diarrhea, August 12 and 13.
 No. 285. Diarrhea, August 16 and 17.
 No. 286. Remittent malaria, August 16 to 22.
 No. 287. Diarrhea, August 16 to 19; diarrhea, August 24 and 25.
 No. 288. Diarrhea, August 18 to 20.
 No. 289. Diarrhea, August 19 and 20; remittent malaria, August 22 and 23.
 No. 290. Diarrhea, August 20 to 22; remittent malaria, August 22 to 27.
 No. 291. Diarrhea, August 20 and 21.
 No. 292. Intestinal colic, August 21 to 25.
 No. 293. Intermittent malaria, July 16 and 17.
 No. 294. Pernicious anemia, June 5 to 10; diarrhea, August 25 to 27.
 No. 295. Intermittent malaria, August 25; granted sick leave August 29.
 No. 296. Diarrhea, August 28 and 29.
 No. 297. Intermittent malaria, August 29; left incomplete.
 No. 298. Intermittent malaria, August 29; left incomplete.
 No. 299. Dysentery, August 30 to September 6.
 No. 300. Remittent malaria, September 6 and 7.
 No. 301. Malaria, September 9 to 14.
 No. 302. Rheumatism, July 30 to August 2; rheumatism, August 6 to 8.
 No. 303. Diarrhea, July 30 to August 2; remittent malaria, August 19 to 22.
 No. 304. Intermittent malaria, August 3 to 10.
 No. 305. Intermittent malaria, August 3 to 13.
 No. 306. Intermittent malaria, August 4 to 8.
 No. 307. Intermittent malaria, August 5 to 16.
 No. 308. Intermittent malaria, August 6 to 13.
 No. 309. Remittent malaria, September 6 to 16.
 No. 310. Intestinal colic, August 8 to 10.
 No. 311. Diarrhea, August 8 to 13.
 No. 312. Diarrhea, August 8 to 10.
 No. 313. Diarrhea, July 12 to 15; diarrhea, August 10 and 11; diarrhea, August 25 to 27.
 No. 314. Diarrhea, August 10 to 13.
 No. 315. Intermittent malaria, August 10 to 17.
 No. 316. Diarrhea, August 10 to 12.
 No. 317. Diarrhea, August 12 and 13; intermittent malaria, August 16 to 21.
 No. 318. Diarrhea, August 12 and 13.
 No. 319. Otitis, August 13 to 15; otitis, August 17 to 26.
 No. 320. Diarrhea, July 12 to 14; diarrhea, July 17 to 23; discharged for debility August 13.
 No. 321. Diarrhea, August 15 and 16.
 No. 322. Intestinal colic, August 16 to 20.
 No. 323. Remittent malaria, August 16 to 22.
 No. 324. Diarrhea, August 17 and 18.
 No. 325. Diarrhea, August 20 and 21.
 No. 326. Diarrhea, August 20 and 21; diarrhea, August 29 to September 4.
 No. 327. Diarrhea, August 20 to 22.
 No. 328. Intestinal colic, August 21 to 23.
 No. 329. Intermittent malaria, August 23; sick leave, August 29.

 No. 620. Remittent malaria, August 22; granted sick leave August 31.
 No. 621. Diarrhea, August 24 and 25.

No. 622. Gonorrhea, August 24 to 28.
 No. 623. Diarrhea, August 25 to 27; intestinal colic, August 30; returned to duty September 5.
 No. 624. Diarrhea, August 25 to 28; diarrhea, August 29; returned to duty September 5.
 No. 625. Diarrhea, August 26 to 28.
 No. 626. Diarrhea, June 2 and 3; hysteria, July 21 and 22; diarrhea, August 30 and 31.
 No. 627. Diarrhea, August 29; returned to duty September 14.
 No. 628. Intestinal colic and intermittent malaria, August 31; returned to duty September 18.

SUMMARY.

Assembled at Peekskill, N. Y., in April, 1898.
 Mustered into United States service between May 6 and 21, 1898.
 Arrived at Chickamauga Park, Ga., May 25, 1898.
 Strength on arrival, 849.
 Date of first case of probable typhoid fever, June 24, 1898.
 Date of first case of recognized typhoid fever, June 24, 1898.
 Left Chickamauga Park, Ga., September 6, 1898.
 Strength on departure, 1,301.
 Number of probable cases of typhoid fever developed at Chickamauga 390 (?)
 Arrived in New York City about September 9, 1898.
 Furloughed in New York City September 9, 1898.
 Number of probable cases of typhoid fever developed after leaving Chickamauga 35 (?)
 Total number of probable cases of typhoid fever developed in the Eighth New York Volunteer Infantry from May to September, 1898..... 425
 These 425 cases were diagnosed as follows:
 Typhoid fever..... 190
 Malaria..... 212
 Diarrhea..... 22
 Intestinal colic 1
 Total 425

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Amann, Jacob.....	Pvt., A.	Sept. 3	Camp Thomas, Ga....	Typhoid.
Black, James.....	Pvt., K.	July 30	Lytle, Ga.....	Do.
Clarke, W. F.....	Hosp. S.	Aug. 26	New York City.....	Pneumonia.
Clevenger, W. A.....	Artificer, C.	Sept. 5	Chickamauga, Ga....	Typhoid.
Daly, John A.....	Pvt., E.	Sept. 14	Long Island City, N. Y.	Do.
Duff, William P.....	Sgt., H.	Sept. 16	Long Island College Hospital, Brooklyn, N. Y.	Do.
Duncan, Thomas S....	Pvt., F.	Sept. 8	St. Luke's Hospital, New York City.....	Do.
Durand, Frank.....	Pvt., I.	Sept. 17	New York City.....	Do.
Feit, Adam, jr.....	Pvt., H.	Sept. 14do.....	Do.
Glover, Joseph.....	Mus., L.	Sept. 6	Mount Vernon, N. Y.	Do.
Grossman, G. H.....	Pvt., M.	Sept. 30	New York City.....	Do.
Jones, W. S. H.....	Pvt., A.	Sept. 12	Camp Thomas, Ga....	Do.
Kelly, M. J.....	Q.M.sgt.	July 1do.....	Do.
Law, Charles A.....	Pvt., F.	Aug. 17	Chickamauga, Ga....	Do.
Lindheim, George.....	Asst. surg.	Sept. 16	New York City.....	Do.
O'Brien, Mortimer.....	Pvt., E.	Aug. 24	Chickamauga, Ga....	Do.
Patterson, H. D.....	Pvt., G.	Aug. 21	Camp Thomas, Ga....	Peritonitis and typhoid fever.
Rany, Joseph.....	Pvt., K.	Sept. 24do.....	Typhoid.
Rosenbohm, A.....	Pvt., A.	Sept. 21	New York City.....	Do.
Schilling, F.....	Pvt., D.	Aug. 23	Camp Thomas, Ga....	Do.
Storm, Howard J.....	Sgt., B.	Aug. 13	Chickamauga, Ga....	(Typhoid); neutraemia.
Von Hillebrandt, O....	Corpl. B.	Aug. 30	Camp Thomas, Ga....	Typhoid.
Young, Charles.....	Pvt. K.	Sept. 26	Chickamauga, Ga....	Do.

Total deaths..... 23
 Deaths due to typhoid fever 22
 Percentage of deaths among probable cases (425) of typhoid fever, 5.17.
 Percentage of deaths among recognized cases (190) of typhoid fever, 11.58.

It will be observed that the number of probable cases of typhoid fever in this regiment is greatly in excess of that in any other regiment of this division. For this reason we have made alphabetical lists of all the sick from all causes found on the regimental reports.

We will now attempt a critical study of the sickness in this regiment. In doing this we will first give attention to the group of cases of recognized typhoid fever. These cases naturally fall into two classes:

(a) Those recognized as typhoid fever by the regimental surgeons.

(b) Those sent to the hospitals under some other diagnosis and first recognized as typhoid fever by the surgeon in charge of the hospital.

The first class includes the following cases: Nos. 1 to 72 inclusive, and Nos. 76, 86, 92, 94, 95, 140, 141, 170, 171, 172, 180, 182, 187, 188, 189, and 190—88 in all.

Of the 102 cases first recognized as typhoid fever in the hospital, 88 apparently have the initial date of the typhoid fever on September 9, 1898. These cases are interesting, probably more interesting than they would have been had they been correctly diagnosed at first. The most superficial examination of the data given above will convince anyone that September 9 was not the true initial date of the typhoid fever in the majority of these cases, probably in none of them, although in a few there is no record of previous illness. From a study of these cases we draw the following conclusions:

1. Some of these patients were convalescing from typhoid fever when the disease was first recognized. Cases 114, 127, 128, 142, 143, 144, 145, 148, 149, 152, 153, 154, and 155 are examples of this. The true initial date in many of these cases can be determined by an inspection of the data given with each case. In others there is no record of any illness previous to September 9. Cases 78, 83, 84, 85, 90, 98, 99, 102, 103, 104, 108, 110, 115, 118, 119, 121, 125, 130, 132, 134, 135, 139, 143, 145, 156, 157, 164, 167, and 188 are examples. In still other cases the preceding recorded illness evidently had nothing to do with the typhoid fever first reported September 9. Cases 113, 124, 150, and 152 are examples. In all of these cases we are compelled to accept as a matter of record September 9 as the initial date, although it is quite evident that this is not always true. This is certainly not true in cases 98, 110, 143, 145, and 152 and is not probable in many others. For instance, in No. 98 typhoid fever was recognized September 9 and the patient died eight days later. It is more than probable that the disease had existed for some time previous to September 9. In No. 110 death occurred ten days after the disease was recognized. While we do not deny the possibility of death occurring so soon after the initial date of the disease, the greater probability is that the disease had made considerable progress before its true character was recognized according to the records. In cases 143, 145, and 152 the patients were returned to duty after eight days for one and after five days for each

of the others. There can be no doubt about the accuracy of the diagnosis in these cases, since the men were in three of the best hospitals in New York. However, the fact that they were "returned to duty" must not be supposed to indicate that they were strong enough to resume the duties of soldiers in the field or in camp. The regiment had been furloughed and the "returned to duty" probably means nothing more than that these men were considered well enough to be taken from the hospitals to their homes. Making all due allowance, it must be admitted that in all probability these men were convalescing from typhoid fever when they were admitted to hospital, and the true initial dates of illness must have been some considerable time prior to September 9.

2. In studying the data before us we are forced to conclude that among soldiers, more often probably than in civil practice, typhoid fever is often far advanced before it is recognized. The facts already given demonstrate this, and render further comment on this point unnecessary. That this is a potent factor in the spread of typhoid fever in camps must be evident. With as many unrecognized cases of typhoid fever as there were in this regiment, and with these men defecating in the pits and on the grounds over which men walked, drinking from the same water receptacles, eating at the same messes, and occupying tents in common with others, the chances for the transmission of the specific infection were great, as the history of this and other regiments in our camps during the summer of 1898 demonstrates.

3. In military practice typhoid fever is often apparently an intermittent disease. In our opinion, many of the cases in the lists made from this regiment illustrate this fact. Let us take a few examples: No. 133 had so-called intermittent malaria August 10, and was returned to duty August 15. Four days later he is registered with diarrhea, and reports under this diagnosis for two consecutive days. On the morning of August 21 he is apparently well enough to be returned to duty, but before the day is over he reports to the surgeon in charge again. This time his disease is diagnosed as remittent malaria, and he is evidently carried on the sick list under this diagnosis until September 9, when he is transferred to the Presbyterian Hospital in New York City and the true nature of the disease from which he has been suffering is for the first time recognized. No. 162 is reported with diarrhea from July 17 to 19; was on duty for five days; was carried on sick report under the diagnosis of diarrhea for three days; on the same day in which he was returned to duty his name was entered on the sick report with intermittent malaria, which continued to August 29, 1898. When he reached the New York hospital, September 9, he was convalescing from typhoid fever. The reader, if he cares to do so, may easily detect a number of similar cases. We have stated that these are "apparently" intermittent fevers. We do not intend to state that

these apparent intermissions were afebrile. It is probable that a temperature record would show that this was not the case. We mean when we state that they were apparently intermittent that there were periods when the patients felt better, and for this reason were returned to duty.

Proceeding to our second list of cases, which includes those believed by us to have been typhoid fever but which were never diagnosed as such, we ask that a comparison be made between the first and second lists, when one will readily see reasons for our belief.

Suppose that the 102 cases in the first group which were not recognized as typhoid fever by the regimental surgeons had never gone to the hospitals, would their true nature have been more clearly discernible than is the true nature of the illness in the second list of cases? After studying the data given, and after knowing that Professor Dock and Doctor Craig found only one or two cases of malaria in the hundreds of sick at Chickamauga Park, and that these cases yielded promptly to single doses of quinine, we can not come to any other conclusion than that the cases of the second list were as certainly typhoid fevers as were those of the first list. It might be asked why the mortality was so much smaller in the second group than in the first group. In the first group there are 190 cases, with 13 reported deaths; in the second group there are 187 cases, with only 3 reported deaths. Moreover, in the first group there are only 62 completed cases, with 13 deaths, while in the second group there are 95 completed cases, with only 3 deaths. However, it is more than probable that some of the cases in the first group were diagnosed typhoid fever because they died, and there is no doubt that the first group contains a larger number of the more serious cases.

In the third group or list the following cases may have been typhoid fever: Nos. 202, 206, 207, 209, 230, 235, 241, 245, 267, 269, 270, 271, 278, 280, 295, 320, 329, 331, 345, 350, 379, 380, 384, 385, 415, 431, 432, 435, 444, 461, 472, 476, 479, 496, 514, 519, 521, 560, 561, 562, 564, 570, 571, 581, 602, 617, 619, and 620—48 in all. We will call these possible cases of typhoid fever. Adding these three groups we have the following:

Cases of recognized typhoid fever.....	190
Cases of probable typhoid fever.....	187
Additional cases of possible typhoid fever.....	48
Total cases of possible typhoid fever.....	425

Twenty-two deaths in 425 cases gives a mortality of 5.17 per cent.

The history of this regiment studied along with the histories of certain other regiments, notably the Fifteenth Minnesota and the Two hundred and third New York in the Second Army Corps, seems to indicate that when a regiment is saturated, as it were, with the typhoid infection about one-third of the men are susceptible to the disease.

The first recognized case of typhoid fever in this regiment had its initial date, according to the regimental record, on June 24. However, the fact that this man died July 1 leads to the suspicion that he might have been sick some days before the recorded initial date. So far as we can ascertain from a study of the regimental and hospital records, this was the first possible case of typhoid fever in this regiment. This command reached Chickamauga, as has been stated, May 25, 1898. It is impossible to determine with any certainty whether the first case received the infection before or after arrival at Chickamauga. The probabilities seem to be that this regiment reached Chickamauga free from typhoid infection. Whether the disease was brought in by recruits or introduced from infected regiments at Chickamauga we have no means of determining.

In the third group or list 446 individuals are reported as having had some intestinal disorder. Some of these individuals had two or more attacks and some are recorded as having had both some intestinal disorder and some form of malaria. As far as we can judge from the records, very few of those who had typhoid fever show any evidence of a previous intestinal disorder. A careful study of the list of 190 cases of recognized typhoid fever convinces us that more than 80 per cent of these had neither intestinal disorder nor so-called malaria previous to infection with typhoid fever. The change in diagnosis from malaria to typhoid fever renders this apparently not true, but an inspection of the recorded data convinces anyone that in the majority of these cases the recorded previous illness was really a part of the typhoid fever. In some of the cases which we have excluded from the list of those without previous illness, the recorded previous illness was probably a part of the typhoid fever. The following cases are illustrations: Nos. 31, 36, 38, 44, 53, 80, 91, 92, 161, and 169.

In the second list containing the probable cases of typhoid fever the number without preceding intestinal disorders is more than 90 per cent of the whole. Indeed, we find that it is true of this regiment and of other regiments in general that the men who had typhoid fever had not had a preceding intestinal disorder. The converse of this is also true, that the men who had temporary intestinal disorders did not as a rule subsequently have typhoid fever. The only conclusion that we can draw from this is that many of the temporary intestinal disorders must have given at least partial and temporary immunity from typhoid fever. This means that many of the temporary intestinal disorders must have been accompanied by typhoidal infection. Studying this question more closely we find that the diarrheas of May and June gave less protection against typhoid fever than did the diarrheas of July and August. This is true not only of this regiment but of others as well. In other words, the intestinal disorders of short dura-

tion that prevailed among the troops simultaneously with the wide spread of typhoid fever protected against typhoid fever, while the intestinal disorders of short duration that prevailed before the typhoid fever infection became widespread did not, at least as greatly, protect against typhoid fever. The most plausible explanation of this seems to us to be the following: Among the troops typhoid fever was in the majority of instances spread by infection of food by means of flies, by dust, and by infected hands. A fly feeding upon infected feces in a sink alights upon some article of food. Here the fly probably deposits colon bacilli and other putrefactive germs in great numbers and typhoid bacilli in relatively small numbers. The former being present in great numbers causes within a few hours a profuse diarrhea which sweeps out of the intestines not only the putrefactive organisms but the greater part of the typhoid bacilli and the man escapes with a diarrhea, and at the same time acquires some immunity to typhoid fever. In other words, the infection is a mixed one in which the specific bacilli are greatly in the minority, and the effect of the putrefactive germs results not only in preventing serious typhoid infection but in establishing some degree of immunity to subsequent invasions of the typhoid bacillus.

COMMUNICATIONS FROM THE SURGEONS OF THE EIGHTH NEW YORK VOLUNTEER INFANTRY.

Medical officers.

Louis K. Neff, major and surgeon, New York City, N. Y.

Herman A. Haubold, captain and assistant surgeon, New York City, N. Y.

Captain Haubold thinks that typhoid fever was carried to Chickamauga by infected soldiers, and that the chief agent in its distribution was the drinking water.

GENERAL REMARKS CONCERNING TYPHOID FEVER IN THE FIRST DIVISION OF THE THIRD ARMY CORPS.

Our knowledge concerning the conditions existing among the regiments of this division at Chickamauga is meager and fragmentary. When we reached Chickamauga on our tour of inspection all the regiments of this division had departed. We obtained the testimony of Maj. Guy L. Edie, who for some time acted as sanitary inspector for this division. To this testimony we are indebted for the following information. Major Edie reached Chickamauga August 3, 1898, and began immediately to inspect these regiments. When asked as to the condition found in this inspection, he made the following statement:

I found that nearly all the companies had kitchen sinks within a few feet of the kitchens. These sinks consisted of shallow pits which when filled were covered with earth. Into these, kitchen refuse and slops were thrown. The privy vaults were dug to the rear, some of them at the proper distance, but very shallow and wide, and the contents were imperfectly covered. Some of these pits were not more than 2 feet deep. Neither earth nor lime had

been thrown upon the contents. They were in a very filthy condition and contained myriads of flies. I found the camp of the Third United States Cavalry very bad. I went through the companies and told the captains that they would probably have a great deal of sickness. I rode through the woods adjoining this camp and saw at that time fourteen men defecating in the woods. There were probably more, for there was a long stretch of the woods. With the exception of two regiments, the locations of all the organizations of this division were pretty good, but the sinks were in a miserable condition. Most of these regiments had remained in the same location since coming to this place. Efforts had been made, as I found out afterwards, to change the sites of the camps. I advised that the regiments be moved out of the woods into the sunlit fields, but was told that a man had a lease of these fields and that time would be necessary in order to get a permit to occupy them. Later lime was obtained, and I instructed each regimental and brigade surgeon to see that each regiment had a barrel of lime each day and that it be used freely for both kitchen and company sinks. I also advised that the kitchen refuse be hauled away and that the company sinks be dug deeper and the contents be covered with earth and lime each day. At that time there was not sufficient tentage for the sick, and some of them were compelled to lie under flies. A number of the hospital tents did not have floors. The quartermaster was directed to make requisitions for the lumber needed for flooring and for hospital tents. I brought these requisitions over to headquarters and had them approved. I then went and saw the quartermaster, and very shortly afterwards a sufficient quantity of hospital tents and lumber for flooring were furnished for the division hospital.

I recommended that the men be compelled to boil the water taken from the hydrant, and an order to this effect was issued. However, I believe that this order was not fully obeyed. Men frequently drank from the hydrants, and at two reviews I saw men filling their canteens from the hydrants. This water was obtained from Chickamauga Creek. A number of the regiments, however, hauled their water from springs outside the park, principally from Blue Spring and Park Spring. There was one driven well in this division, and individually the men used water from this well. This was especially true of the ambulance corps and of the Eighth New York Volunteer Infantry. The water obtained from Blue Spring was cloudy. The water obtained from the pipes was abundant in quantity, but of suspicious quality. In regard to obtaining the water from the springs, there were not enough barrels for storing this water until latterly, when a sufficient supply of barrels was obtained.

Many huckster wagons were driven through the camps, and milk from these was generally sold to the soldiers. This milk was of doubtful quality. The milk for the hospitals was sent from Biltmore, N. C., and we received about 200 gallons of this each day. This milk was supposed to be good. An order was issued to keep vendors of milk outside the limits of the division.

The regimental and brigade officers were requested to have the fruits and melons offered for sale among the men inspected and to permit the sale of only those that were apparently good.

When asked whether or not he had formed any opinion concerning the source and the manner by which typhoid fever was spread throughout this division, Major Edie made the following statement:

I thought that the piped water supply was infected and there was ample opportunity for the food around the kitchens to get infected by the flies. The fecal matter in the pits was not covered, as I have stated. The cook at the division hospital called my attention to the fact that when they were using lime freely around the sinks the flies alighting upon the food had their feet covered with lime. The great increase in typhoid fever was immediately after heavy rains—I should say about ten days or two weeks after heavy rains. We had some typhoid fever before that time, but

the great influx of typhoid cases came after the heavy rains. There were also numerous wet-weather springs in the hollows and many of the companies used this water. I saw soldiers drinking from these springs and cautioned them against it. They thought that it was good water, but it was nothing but a wet-weather spring.

In regard to the hospital of the First Division of the Third Army Corps, Major Woodhull, in a report to the Surgeon-General, under date of August 7, 1898, makes the following statement:

At the time of my inspection, July 27, the hospital control was just being assumed by a newly arrived officer, who could not be regarded as responsible for its defects nor be credited with its advantages. The staff consists of 5 medical officers, and the enlisted force was 95 noncommissioned officers and privates of the Hospital Corps. The hospital consists of 30 hospital tents for all purposes, containing at this date 179 patients. The tents are too crowded, containing 8 patients apiece, and they have had 10. There is insufficient space between the wards, the grounds are not adequately ditched, and the approach to the patients' sinks is very poor. The sinks themselves are very bad. The hospital is not divided into brigades.

The Red Cross supplies about one-half of the clothing and the bedding. The floors that have been supplied the tents were furnished by regimental means. The hospital fund started with \$50, and there was \$48 at the end of the month, but considerable expenditures had been made by emergency funds supplied by the regiments. Very serious complaints are made as to the inadequacy of the medical supplies. No atropine is on hand and the salol has been bought by private means. The chloroform supplied from the 1st to 10th of June was regarded as inert, although this might depend on the inexperience of the administrator in open-air work, but the bottles contained a small part of the marked contents. Chocolate-coated quinine tablets in stock, Parke, Davis & Co., tablet 125 (563360 in red), are insoluble and found in the stools. I am informed in Washington that this is not supplied by the Medical Department. It was evidently regarded there as part of the regular supplies. The food as a whole is good and the special diet kitchen was very neat and appeared excellent. Two of a case of twelve sides of bacon then on hand were bad, and I personally observed the maggots in them. There was only one very small coffee mill, apparently belonging to a mess chest, for the whole hospital, and one man was employed all day in grinding coffee. The average duration of treatment, excluding the typhoid cases, is stated at three or four days. Cases are transferred to Leiter and to McPherson general hospitals. Fifty men are employed as nurses and are on duty from twelve to eighteen hours continuously day by day. As far as observed, all the hospital cases of this division were taken into the hospital.

In looking over the list of cases of probable typhoid fever in this division one is at once struck by the much greater number of cases in the Eighth New York than in any other regiment of the division. Since all of these regiments used the Chickamauga Creek water, we must conclude that the great prevalence of typhoid fever in the Eighth New York must have been due to some special local condition, and that water infection could

not have been the most important factor in the spread of typhoid fever in this division. While we did not reach Chickamauga in time to inspect the regiments of this division, the general statement was made to us that the camp of the Eighth New York was especially filthy. Whether or not the men of this regiment received the typhoid infection from the water of the driven well which they used, or from wet-weather springs, we can not say.

The following figures give the principal facts concerning typhoid fever in this division:

Brigade and regiment.	Date of first case.	Total number of cases.	Number of recognized cases.	Total deaths.	Deaths from typhoid.	Per cent of deaths among probable cases.	Per cent of deaths among recognized cases.
<i>First Brigade.</i>							
Fourteenth New York ..	May 23	233	95	31	24	10.30	25.26
First Missouri	May 31	216	46	14	11	5.09	23.91
Fifth Maryland	June 25	250	147	18	17	6.80	11.56
<i>Second Brigade.</i>							
Second Nebraska	May 26	167	56	26	22	13.17	39.28
Second New York	June 1	161	46	31	30	18.63	65.21
First District of Columbia.							
<i>Third Brigade.</i>							
Third Tennessee	June 9	123	61	19	12	9.75	19.67
First Vermont	May 26	278	84	26	22	7.91	26.19
Eighth New York	June 24	425	190	23	22	5.17	11.58

Total number of cases of probable typhoid fever in the eight regiments of this division	1,853
Total number of deaths from typhoid in the eight regiments	160
Percentage of deaths among probable cases of typhoid fever	8.63
Total number of cases of recognized typhoid fever in the eight regiments of this division	725
Percentage of deaths among recognized cases of typhoid fever	22.07

Summary of deaths in the First Division of the Third Army Corps.

Brigade and regiment.	Total deaths.	Deaths due to typhoid fever.
<i>First Brigade.</i>		
Fourteenth New York	31	24
First Missouri	14	11

General remarks concerning typhoid fever in the Second Division of the Third Army Corps	264
Table showing the morbidity and mortality from typhoid fever in the Third Army Corps	268

SECOND KENTUCKY VOLUNTEER INFANTRY.

First Brigade, Second Division, Third Army Corps.

This regiment was mustered into service at Lexington, Ky., May 22. It left Lexington for Chickamauga Park on May 25 and arrived at the latter place May 26.

The surgeon in charge was Maj. Walter H. Dade.

CONDENSED SICK REPORT FROM MAY 22 TO 31, INCLUSIVE.

Mean strength	982
Diarrhea	7
Intermittent malaria	1
Other diseases	18
Total	26

In the June report, Surgeon Dade makes the following statement:

The cases reported unable for duty are due to vaccination. There is very little sickness from diseases other than those common to camp life. Regulars and recruits are all vaccinated, a small majority taking, owing to the fact that the smallpox scare in Kentucky caused them to seek protection in vaccination several months before enlisting. The proportion of sore arms is small.

CONDENSED SICK REPORT FOR JUNE.

Mean strength	1,312
Intermittent malaria	22
Acute diarrhea	53
Dysentery	1
Other diseases	68
Total	144

There is no comment offered with the July report.

CONDENSED SICK REPORT FOR JULY.

Mean strength	1,388
Intermittent malaria	63
Remittent malaria	47

Acute diarrhea	93
Typhoid fever	17
Dysentery	3
Other diseases	127
Total	350

It appears from this report that typhoid fever appeared for the first time in July. Later we will take up the recognized and suspicious cases of typhoid fever and make an analysis of the same.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength	1,329
Intermittent malaria	92
Remittent malaria	79
Acute diarrhea	121
Dysentery	1
Typhoid fever	30
Continued fever	6
Other diseases	40
Total	369

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength	1,329
Intermittent malaria	36
Remittent malaria	13
Acute diarrhea	41
Typhoid fever	6
Dysentery	1
Other diseases	23
Total	120

The following is a list of the recognized and suspected cases of typhoid fever in this regiment:

- No. 1. Company C: Typhoid fever, June 26; sent to Leiter Hospital July 6. Further disposition not given.
- No. 2. Company D: Intermittent malaria, June 29 to July 16.
- No. 3. Company G: Intermittent malaria, June 29 to July 25.
- No. 4. Company M: Intermittent malaria, June 29; still sick in

hospital July 31. The initial date of this illness was probably earlier than indicated. The same man is recorded as having had malaria June 19 to 25. Most probably he had typhoid fever with the initial date at June 19.

No. 5. Company D: Typhoid fever, June 30; died July 15.

No. 6. Company F: Remittent malaria, July 1 to 26.

No. 7. Company D: Without date or diagnosis; sent to division hospital July 2. Here the disease was diagnosed intermittent malaria, and the patient was returned to duty July 24.

No. 8. Company D: Without date or diagnosis; sent to division hospital July 2. Here the disease was diagnosed diarrhea, and the patient was furloughed July 15.

No. 9. Company D: Intermittent malaria, July 2 to 24.

No. 10. Company F: Without date or diagnosis; sent to division hospital July 3. Here the disease was diagnosed remittent malaria, and the patient was furloughed July 17.

No. 11. Company L: Typhoid fever, July 3; furloughed August 13.

No. 12. Company C: Typhoid fever, July 5; sent to Fort McPherson July 25.

No. 13. Company C: Without date or diagnosis; sent to Leiter Hospital July 6. Here the disease was diagnosed typhoid fever, and the patient was furloughed August 6.

No. 14. Company K: Typhoid fever July 6; furloughed July 27.

No. 15. Company D: Typhoid fever, July 6; sent to Fort McPherson July 25.

No. 16. Company K: Without date or diagnosis; sent to division hospital July 7. Here the disease was diagnosed typhoid fever, and the patient was furloughed July 28.

No. 17. Company B: Typhoid fever, July 7; sent to Fort McPherson July 25.

No. 18. Company D: Without date or diagnosis; sent to division hospital July 8. Here the disease was diagnosed malaria, and the patient was furloughed July 18.

No. 19. Company B: Without date or diagnosis; sent to division hospital July 8. Here the disease was diagnosed typhoid fever, and the patient was furloughed July 31.

No. 20. Company F: Without date or diagnosis; sent to division hospital July 8. Here the disease was diagnosed remittent malaria, and the patient was still sick in hospital July 31.

No. 21. Company D: Intermittent malaria, July 8; furloughed July 29.

No. 22. Company A: Diarrhea, July 9; still sick July 31.

No. 23. Company C: Intermittent malaria, July 10; still sick in hospital July 31.

No. 24. Company E: Without date or diagnosis; sent to division hospital July 10. Here the disease was diagnosed remittent malaria, and the patient was furloughed July 29.

No. 25. Company F: Diarrhea, July 10; furloughed August 1.

No. 26. Company M: Typhoid fever, July 11; died August 9.

No. 27. Company D: Without date or diagnosis; sent to division hospital July 11. Here the disease was diagnosed typhoid fever, and the patient was furloughed July 31.

No. 28. Company H: Diarrhea, July 12; furloughed August 15.

No. 29. Company L: Diarrhea, July 12; still sick in hospital July 31.

No. 30. Company A: Without date or diagnosis; sent to division hospital July 12. Here the disease was diagnosed dysentery, and the patient was furloughed July 24.

No. 31. Company B: Diarrhea, July 12; sent to division hospital August 12. Here the diagnosis was changed to malaria, and the patient was furloughed August 25.

No. 32. Company H: Typhoid fever, July 13; sent to Fort McPherson July 13.

No. 33. Company H: Diarrhea, July 13; returned to duty July 29. There is some doubt whether the "return to duty" means what it says or signifies furlough.

No. 34. Company D: Remittent malaria, July 14; still sick September 30.

No. 35. Company F: Typhoid fever, July 14; sent to Fort McPherson July 25.

No. 36. Company B: Remittent malaria, July 14; still sick September 30.

No. 37. Company L: Without date or diagnosis; sent to division hospital July 14. Here the disease was diagnosed remittent malaria and the patient remained sick September 30.

No. 38. Company F: Without date or diagnosis; sent to division hospital July 14. Here the disease was diagnosed typhoid fever and the patient was transferred to Fort McPherson July 25.

No. 39. Company F: Remittent malaria, July 15; still sick September 30.

No. 40. Company F: Without date or diagnosis; sent to division hospital July 15. Here the disease was diagnosed remittent malaria, and the patient was still sick September 30.

No. 41. Company D: Typhoid fever, July 15; still sick September 30.

No. 42. Company B: Remittent malaria, July 15; still sick September 30.

No. 43. Company M: Remittent malaria, July 15; still sick September 30.

No. 44. Company F: Diarrhea, July 15; still sick September 30.

No. 45. Company D: Without date or diagnosis; sent to division hospital July 15. Here the disease was diagnosed continued malaria, and the patient was still sick September 30.

No. 46. Company G: Without date or diagnosis; sent to division hospital July 16. Here the disease was diagnosed malaria, and the patient was still sick September 30.

No. 47. Company G: Intermittent malaria, July 16 to August 11.

No. 48. Company C: Intermittent malaria, July 16; still sick September 30.

No. 49. Company F: Remittent malaria, July 16; still sick September 30. This man is recorded as having had malaria from July 3 to 7.

No. 50. Company G: Remittent malaria, July 16; still sick September 30.

No. 51. Company F: Remittent malaria, July 16; still sick September 30.

No. 52. Company B: Remittent malaria, July 18; still sick September 30.

No. 53. Company M: Remittent malaria, July 18; still sick September 30.

No. 54. Company L: Without date or diagnosis; sent to division hospital July 18. Here the disease was diagnosed remittent malaria, and the patient was furloughed July 30.

No. 55. Company E: Without date or diagnosis; sent to division hospital July 19. Here the disease was diagnosed remittent malaria, and the patient was still sick September 30.

No. 56. Company E: Remittent malaria, July 20; still sick September 30.

No. 57. Band: Without date or diagnosis; sent to division hospital July 20. Here the disease was diagnosed malaria, and the patient was still sick September 30.

No. 58. Company B: Without date or diagnosis; sent to division hospital July 21. Here the disease was diagnosed remittent malaria, and the patient was still sick September 30.

No. 59. Company E: Typhoid fever, July 21; still sick September 30.

No. 60. Company B: Without date or diagnosis; sent to division hospital July 21. Here the disease was diagnosed remittent malaria, and the patient was still sick September 30.

No. 61. Company G: Typhoid fever, July 22; still sick September 30.

No. 62. Company K: Typhoid fever, July 22; died in Leiter Hospital July 30.

No. 63. Company M: Typhoid fever, July 22; still sick September 30.

No. 64. Company D: Remittent malaria, July 23; still sick September 30.

No. 65. Company G: Remittent malaria, July 23; still sick September 30.

No. 66. Company M: Without date or diagnosis; sent to division hospital July 23. Here the disease was diagnosed typhoid fever, and the patient was still sick September 30.

No. 67. Company E: Remittent malaria, July 23; still sick September 30.

No. 68. Company C: Remittent malaria, July 23; died in Leiter Hospital August 29. In the hospital this case was diagnosed typhoid fever.

No. 69. Company E: Typhoid fever, July 23; still sick September 30.

No. 70. Company E: Typhoid fever, July 23; still sick September 30.

No. 71. Company G: Remittent malaria, July 24; still sick September 30. This man had diarrhea June 6 to 13.

No. 72. Company B: Without date or diagnosis; sent to division hospital July 24. Here the disease was diagnosed typhoid fever, and the patient was still sick September 30.

No. 73. Company E: Without date or diagnosis; sent to division hospital July 25. Here the disease was diagnosed typhoid fever, and the patient was still sick September 30.

No. 74. Company G: Typhoid fever, July 25; still sick September 30.

No. 75. Company E: Remittent malaria, July 26; still sick September 30.

No. 76. Company B: Remittent malaria, July 26; still sick September 30.

No. 77. Company A: Intermittent malaria, July 26 to August 22.

No. 78. Company A: Without date or diagnosis; sent to division hospital July 28. Here the disease was diagnosed malaria, and the patient was still sick September 30.

No. 79. Company E: Remittent malaria, July 28; still sick September 30.

No. 80. Company F: Remittent malaria, July 28; still sick September 30.

No. 81. Company D: Without date or diagnosis; sent to division hospital July 28. Here the disease was diagnosed remittent malaria, and the patient was still sick September 30.

No. 82. Company E: Intermittent malaria, July 29; still sick September 30.

No. 83. Company G: Remittent malaria, July 29; still sick September 30.

No. 84. Company I: Remittent malaria, July 29; still sick September 30.

No. 85. Company K: Intermittent malaria, July 29; died in Leiter Hospital August 27. In the hospital this case was diagnosed typhoid fever.

No. 86. Company B: Dysentery, July 29 to August 30.

No. 87. Company E: Without date or diagnosis; sent to division hospital July 30. Here the disease was diagnosed typhoid fever, and the patient was furloughed August 6.

No. 88. Company G: Remittent malaria, July 30; still sick September 30.

No. 89. Company B: Without date or diagnosis; sent to division hospital July 30. Here the disease was diagnosed remittent malaria, and the patient was still sick September 30.

No. 90. Company A: Without date or diagnosis; sent to division hospital July 30. Here the disease was diagnosed remittent malaria, and the patient was still sick September 30.

No. 91. Company B: Remittent malaria, July 30; still sick September 30.

No. 92. Company E: Diarrhea, July 30; still sick September 30.

No. 93. Company B: Intermittent malaria, July 31; still sick September 30.

No. 94. Company K: Typhoid fever, July 31; still sick September 30.

No. 95. Company I: Remittent malaria, July 31; still sick September 30.

No. 96. Company G: Intermittent malaria, July 31; still sick September 30.

No. 97. Company A: Remittent malaria, July 31; died in Sternberg Hospital August 17. In the hospital this case was diagnosed typhoid fever.

No. 98. Company C: Intermittent malaria, July 31 to September 30.

No. 99. Company A: Without date or diagnosis; sent to division hospital July 31. Here the disease was diagnosed remittent malaria, and the patient was furloughed August 9.

No. 100. Company C: Remittent malaria, August 1; still sick September 30.

No. 101. Company F: Intermittent malaria, August 2; still sick September 30. In the hospital this case was diagnosed typhoid fever.

No. 102. Company F: Typhoid fever, August 2; died in Sternberg Hospital August 17.

No. 103. Company K: Remittent malaria, August 2; still sick September 30.

No. 104. Company F: Diarrhea, August 2; still sick September 30.

No. 105. Without company, date, or diagnosis; sent to division hospital August 3. Here the disease was diagnosed undetermined fever, and the patient was still sick September 30.

No. 106. Company E: Intermittent malaria, August 3; still sick September 30.

No. 107. Company B: Typhoid fever, August 3; died in Sternberg Hospital September 26.

No. 108. Company H: Remittent malaria, August 3; still sick September 30.

No. 109. Company B: Without date or diagnosis; sent to Sternberg Hospital August 3. Here the disease was diagnosed as continued malaria, and the patient died September 7.

No. 110. Company E: Remittent malaria, August 4; still sick September 30.

No. 111. Company B: Typhoid fever, August 4; still sick September 30.

No. 112. Company F: Typhoid fever, August 4; still sick September 30.

No. 113. Company E: Without date or diagnosis; sent to division hospital August 5. Here the disease was diagnosed continued malaria, and the patient was still sick September 30.

No. 114. Company C: Typhoid fever, August 6; still sick September 30.

No. 115. Company A: Remittent malaria, August 6; still sick September 30.

No. 116. Company A: Continued fever, August 6; still sick September 30. In Sternberg Hospital this case was diagnosed typhoid fever. This man is recorded as having had diarrhea July 31, and the record is left incomplete.

No. 117. Company B: Typhoid fever, August 6; still sick September 30.

No. 118. Company F: Intermittent malaria, August 6; still sick September 30. This man is recorded as having had diarrhea June 25 to 28; diarrhea again July 21, with an incomplete record.

No. 119. Company B: Without date or diagnosis; sent to division hospital August 6. Here the disease was diagnosed continued fever, and the patient was still sick September 30.

No. 120. Company C: Remittent malaria, August 6; still sick September 30.

No. 121. Company A: Without date or diagnosis; sent to division hospital August 6. Here the disease was diagnosed continued fever, and the patient was still sick September 30.

No. 122. Company G: Remittent malaria, August 7; still sick September 30.

No. 123. Company H: Typhoid fever, August 7; still sick September 30.

No. 124. Company G: Remittent malaria, August 7; still sick September 30.

No. 125. Company B: Typhoid fever, August 7; still sick September 30.

No. 126. Company A: Typhoid fever, August 7; died in Sternberg Hospital August 15.

No. 127. Company E: Remittent malaria, August 7; still sick September 30. In the hospital this case was diagnosed typhoid fever.

No. 128. Company C: Typhoid fever, August 7; died in Leiter Hospital August 27.

No. 129. Company G: Typhoid fever, August 8; still sick September 30.

No. 130. Company M: Typhoid fever, August 8; still sick September 30.

No. 131. Company B: Without date or diagnosis; sent to division hospital August 8. Here the disease was diagnosed continued fever, and the patient was still sick September 30.

No. 132. Company H: Without date or diagnosis; sent to division hospital August 8. Here the disease was diagnosed continued fever, and the patient was still sick September 30.

No. 133. Company L: Remittent malaria, August 8; still sick September 30.

No. 134. Company K: Remittent malaria, August 8; still sick September 30.

No. 135. Company K: Without date or diagnosis; sent to division hospital August 9. Here the disease was diagnosed continued fever, and the patient was still sick September 30.

No. 136. Company K: Intermittent malaria, August 9; still sick September 30.

No. 137. Company K: Intermittent malaria, August 9; still sick September 30.

No. 138. Company C: Intermittent malaria, August 9; still sick September 30.

No. 139. Company K: Diarrhea, August 9; still sick September 30. In the hospital this diagnosis was changed to continued malaria.

No. 140. Company B: Remittent malaria, August 10; still sick September 30.

No. 141. Company G: Without date or diagnosis; sent to division hospital August 10. Here the disease was diagnosed continued fever, and the patient was still sick September 30.

No. 142. Company G: Typhoid fever, August 10; still sick September 30.

No. 143. Company G: Intermittent malaria, August 10; still sick September 30.

No. 144. Company A: Remittent malaria, August 11; still sick September 30.

No. 145. Company I: Remittent malaria, August 11; still sick September 30.

No. 146. Company L: Without date or diagnosis; sent to division hospital August 11. Here the disease was diagnosed malaria, and the patient was furloughed from hospital October 6.

No. 147. Company G: Intermittent malaria, August 11; still sick September 30.

No. 148. Company K: Intermittent malaria, August 11; still sick September 30. In the hospital this case was diagnosed typhoid fever.

No. 149. Company K: Without date or diagnosis; sent to division hospital August 11. Here the disease was diagnosed continued fever, and the patient was still sick September 30.

No. 150. Company G: Remittent malaria, August 12; still sick September 30.

No. 151. Company M: Without date or diagnosis; sent to division hospital August 12. Here the disease was diagnosed typhoid fever, and the patient was furloughed August 16.

No. 152. Company H: Remittent malaria, August 12; still sick September 30.

No. 153. Company G: Remittent malaria, August 12; still sick September 30.

No. 154. Company M: Without date or diagnosis; sent to division

hospital August 12. Here the disease was diagnosed remittent malaria, and the patient was still sick September 30.

No. 155. Company A: Remittent malaria, August 12; still sick September 30.

No. 156. Company K: Typhoid fever, August 12; still sick September 30.

No. 157. Company D: Intermittent malaria, August 12; still sick September 30.

No. 158. Company A: Remittent malaria, August 13; still sick September 30.

No. 159. Company I: Without date or diagnosis; sent to division hospital August 13. Here the disease was diagnosed remittent malaria, and the patient was still sick September 30.

No. 160. Company I: Remittent malaria, August 13; still sick September 30. In the hospital this diagnosis was changed to undetermined fever.

No. 161. Company B: Typhoid fever, August 13; still sick in Sternberg Hospital September 30.

No. 162. Company E: Intermittent malaria, August 13; still sick September 30.

No. 163. Company M: Intermittent malaria, August 13; still sick September 30.

No. 164. Company D: Without date or diagnosis; sent to division hospital August 13. Here the disease was diagnosed typhoid fever, and the patient was still sick September 30.

No. 165. Company E: Remittent malaria, August 13; still sick September 30. This man is recorded as having had malaria July 21 to 27.

No. 166. Company I: Typhoid fever, August 14; still sick September 30.

No. 167. Company A: Without date or diagnosis; sent to Sternberg Hospital August 14. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 22.

No. 168. Company B: Intermittent malaria, August 14; still sick September 30.

No. 169. Company B: Diarrhea, August 14; still sick September 30. This man is recorded as having had malaria from July 18 to 24.

No. 170. Without company, date, or diagnosis; sent to division hospital August 14. Here the disease was diagnosed continued malaria, and the patient was still sick September 30.

No. 268. Company H: Without date or diagnosis; sent to division hospital September 6. Here the disease was diagnosed typhoid fever, and the patient was furloughed October 29.

No. 269. Company B: Typhoid fever, September 7; still sick September 30.

No. 270. Company I: Dysentery, September 7; still sick September 30.

No. 271. Company B: Without date or diagnosis; sent to Sternberg Hospital September 7. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 23.

No. 272. Company C: Remittent malaria, September 10; furloughed from Sternberg Hospital October 5.

No. 273. Company A: Typhoid fever, September 10; still sick September 30.

No. 274. Company H: Without date or diagnosis; sent to Leiter Hospital September 11. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 17.

No. 275. Company L: Without date or diagnosis; sent to Sternberg Hospital September 12. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 21.

No. 276. Company G: Without date or diagnosis; sent to Sternberg Hospital September 12. Here the disease was diagnosed as remittent malaria, and the patient was furloughed September 27.

No. 277. Company E: Without date or diagnosis; sent to Sternberg Hospital September 12. Here the disease was diagnosed typhoid fever, and the patient was furloughed October 26.

No. 278. Company A: Without date or diagnosis; sent to hospital September 13. Here the disease was diagnosed remittent malaria, and the patient was still sick September 30.

No. 279. Company A: Without date or diagnosis; sent to hospital September 13. Here the disease was diagnosed typhoid fever, and the patient was transferred to Fort Thomas November 2.

No. 280. Company H: Remittent malaria September 14; sent to division hospital September 14; returned to sick quarters October

12, and returned to division hospital October 21. Here the disease was diagnosed typhoid fever, and the patient was transferred to Fort Thomas November 5.

No. 281. Band; Without date or diagnosis; sent to hospital September 14. Here the disease was diagnosed remittent malaria, and the patient was furloughed September 24.

No. 282. Company E: Without date or diagnosis; sent to division hospital September 14. Here the disease was diagnosed typhoid fever, and the patient died September 23.

No. 283. Company G: Without date or diagnosis; sent to hospital September 16. Here the disease was diagnosed typhoid fever, and the patient was furloughed October 26.

No. 284. Company I: Without date or diagnosis; sent to division hospital September 16. Here the disease was diagnosed remittent malaria, and the patient was transferred to Fort Thomas November 2.

No. 285. Company B: Without date or diagnosis; sent to hospital September 16. Here the disease was diagnosed remittent malaria, and the patient was furloughed October 3.

No. 286. Company M: Without date or diagnosis; sent to division hospital without date. Here the disease was diagnosed typhoid fever, and the further disposition is not given.

SUMMARY.

Assembled at Lexington, Ky., during April and May, 1898.

Mustered into United States service May 22, 1898.

Arrived at Chickamauga Park, Ga., May 26, 1898.

Strength on arrival, 982.

Date of first case of probable typhoid fever, June 26, 1898.

Date of first case of recognized typhoid fever, June 26, 1898.

Left Chickamauga Park, Ga., September 12, 1898.

Strength on departure, 1,332.

Number of cases of probable typhoid fever developed at Chickamauga	277
Number of cases of probable typhoid fever developed after leaving Chickamauga	9

Total number cases of probable typhoid fever developed in the Second Kentucky Volunteer Infantry from May to September, 1898	286
--	-----

These cases were diagnosed as follows:

Typhoid fever	87
Malaria	172
Diarrhea	20
Undetermined fever	5
Dysentery	2
Total	286

The following is an alphabetical list of total deaths in this regiment, so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Boedecker, A. J.	Pvt., G.	1898. Aug. 8	Newport, Ky.	(Typhoid); malarial fever and general debility.
Bright, John M.	Pvt., D.	July 28	Lexington, Ky.	Typhoid.
Burchell, R. R.	Mus., F.	May 27	do	Pneumonia.
Cheatham, J. D.	Pvt., L.	Oct. 17	Bryantsville, Ky.	Typhoid.
Childers, Alma J.	Artif., M.	Aug. 11	Fort McPherson, Ga.	Do.
Eldridge, Arch.	Pvt., G.	Sept. 30	Camp Hamilton, Ky.	Do.
Englebert, Frank.	Pvt., E.	Sept. 23	do	Do.
Finck, Charles.	Pvt., B.	Sept. 6	Chickamauga, Ga.	Do.
Flood, Chesley J.	Pvt., C.	Sept. 4	Camp Thomas, Ga.	Do.
Gorman, John T.	Pvt., F.	Sept. 12	Flemingsburg, Ky.	Do.
Harlan, Wellington.	Pvt., A.	Oct. 12	Harrodsburg, Ky.	Do.
Holmes, Jesse D.	Corpl., E.	Aug. 15	Frankfort, Ky.	Do.
Houp, Calvin.	Pvt., M.	Aug. 11	Pleasant Hill, Ky.	Do.
Huesman, W.	Pvt., K.	July 30	Camp Thomas, Ga.	Do.

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Jenkins, Paul	Pvt., C.	1898. Sept. 26	Cynthiana, Ky	Appendicitis.
Johnston, James R	Pvt., D.	July 15	Camp Thomas, Ga.....	Typhoid.
Knarr, Louis A.....	Pvt., G.	Aug. 26	Newport, Ky	Do.
Mahone, Samuel	Pvt., C.	Aug. 29	Leiter Hospital, Ga.....	Do.
Martin, Oliver.....	Pvt., B.	Sept. 26	Sternberg Hospital.....	Do.
Otis, Joseph	Pvt., F.	Aug. 16	Camp Thomas, Ga.....	Do.
Parks, Clarence	Pvt., L.	Aug. 21	Lancaster, Ky	Do.
Patterson, Russell.....	Pvt., F.	Oct. 11	Lexington, Ky	Do.
Peaveley, W.	Pvt., K.	Aug. 27	Leiter Hospital, Ga.....	Do.
Reed, Grafton W.....	1stsgt. A.	Aug. 19	Chickamauga, Ga.....	Do.
Ronan, W. L.	Pvt., A.	Aug. 17	Camp Thomas, Ga.....	Do.
Smith, Paul P.....	Pvt., I.	Aug. 7	Chickamauga, Ga.....	Do.
Shryack, Hugh E.....	Pvt., D.	Aug. 22	Lawrenceburg, Ky	(Typhoid); hemorrhage of bowels.
Tandy, Jessie.....	Pvt., F.	July 25	Fort McPherson, Ga.....	Typhoid.
Turk, Chas.....	Pvt., B.	Sept. 7	Sternberg Hospital.....	Do.
Woosley, Woodie	Pvt., C.	Aug. 29	Chickamauga	Do.

Total deaths..... 30

Deaths from typhoid fever..... 28

Percentage of deaths among probable cases of typhoid fever (286), 9.79.

Percentage of deaths among recognized cases of typhoid fever (87), 32.18.

We inspected this regiment at Chickamauga September 10, 1898. The command was located in the woods. Fecal matter was deposited around trees, some of which were not more than 50 feet from mess tents. This fecal matter was covered with swarms of flies. Fecal matter was found deposited on the ground all through the woods and a vile odor was perceptible.

The following information is condensed from testimony given to us at the time of the inspection of this camp by Capt. Charles Farmer, assistant surgeon of this regiment. On leaving Lexington, Ky., this regiment did not bring any sick with it to Chickamauga. Upon reaching Chickamauga it encamped at the place now (September 10, 1898) occupied. Some of the tents have been moved a little, but the regiment occupies the same site. On reaching Chickamauga, drinking water was first obtained from Crawfish Spring; later, the pipes carrying Chickamauga Creek water were laid. The men were ordered not to drink from the hydrants at any time, but the probabilities are that they did drink this water. The regiment did not use boiled water at any time. Milk was purchased from venders who went through the camp, and Doctor Farmer was unable to give us any information concerning the character and source of this milk.

Captain Winn, also assistant surgeon of the Second Kentucky Volunteer Infantry, stated to us that when the regiment left Lexington, Ky., one man remained sick with typhoid fever and died later. Captain Winn testified that an attempt had been made to use filters, but they soon clogged up and were broken. When asked his opinion concerning the origin and spread of typhoid fever in the regiment, Captain Winn made the following statement:

I have believed that the disease has been caused by the water or milk which the men have been in the habit of drinking. The camp has been filled with hucksters, who have sold lemonade and milk diluted with water which may have come from some infected source.

NINTH NEW YORK VOLUNTEER INFANTRY.

First Brigade, Second Division, Third Army Corps.

The first report for this regiment covers the period from May 26 to May 31, 1898.

CONDENSED SICK REPORT FOR MAY.

Mean strength	1,025
Diarrhea.....	17
Dysentery	1
Other diseases.....	5
Total	23

The June report is signed by Capt. A. W. Preston, who makes the following statement:

The prevailing cases during the earlier part of the month were attacks of gastritis and acute diarrhea caused by climatic conditions, supplemented by habits of men and improper preparation of their food; attention was given to the direct causes, but the amount of gastritis and diarrhea has been rather on the increase. Instructions, not orders, have been given the men repeatedly about their diet and mode of living, but these instructions in many cases are not followed. The latter part of the month fevers appeared, some distinctly malarial, others unclassified at the time; on removal to division hospital some cases proved to be typhoid. A large number of the men not relieved from duty suffer from loss of appetite, mild diarrhea, and general weakness. The diarrheas have not been checked, but the bowels have been flushed out and available dietetic measures carried out. This treatment has not been possible in many cases. The general health is good, and the tone of the men is good with few exceptions. The sanitary conditions are better than they were at last report, but rules are carried out with difficulty.

CONDENSED SICK REPORT FOR JUNE.

Mean strength	1,129
Dysentery	1
Diarrhea.....	148
Gastro-enteritis	7
Intestinal colic	17
Gastritis	10
Indigestion	5
Intermittent malaria.....	18
Remittent malaria.....	3
Typhoid fever.....	5
Other diseases.....	68
Total	282

There is no comment made on the July report.

CONDENSED SICK REPORT FOR JULY.

Mean strength not given.	
Diarrhea.....	100
Intermittent malaria.....	158
Gastro-enteritis	12
Typhoid fever.....	33
Intestinal colic	6
Malarial enteritis.....	1
Remittent malaria	15
Indigestion	3
Dysentery	1
Other diseases.....	105
Total	434

In the August report Lieutenant Hommedieu makes the following statement:

The prevailing diseases are acute diarrhea, myalgia, intermittent and remittent fevers.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength	1,148
Diarrhea	148
Dysentery	3
Intermittent malaria	105
Remittent malaria	41
Typhoid fever	24
Undetermined fever	118
Gastro-enteritis	12
Intestinal colic	4
Other diseases	102
Total	557

There is no report from this regiment after August.

The following list includes the cases of recognized and probable typhoid fever in this regiment during its stay at Chickamauga Park:

- No. 1. Company E: Diarrhea, June 10 to 20.
- No. 2. Company C: Enteric fever, June 13; still sick August 31.
- No. 3. Company A: Enteric fever, June 15; still sick August 31.
- No. 4. Company L: Enteric fever, June 18; still sick August 31. In the hospital this case was diagnosed typhoid fever.
- No. 5. Company A: Enteric fever, June 18; died at Fort McPherson August 19.
- No. 6. Company E: Tertian malaria, June 24; still sick August 31.
- No. 7. Company K: Tertian malaria, June 24; died July 22.
- No. 8. Company F: Typhoid fever, June 24; still sick August 31.
- No. 9. Company L: Intermittent malaria, June 25 to July 25.
- No. 10. Company A: Tertian malaria, June 26; still sick August 31. In Leiter Hospital this case was diagnosed typhoid fever.
- No. 11. Company A: Quotidian malaria, June 27 to July 7.
- No. 12. Company H: Typhoid fever, June 27; still sick August 31.
- No. 13. Company A: Tertian malaria, June 28; still sick August 31.
- No. 14. Company L: Intermittent malaria, June 28; still sick August 31.
- No. 15. Company D: Tertian malaria, June 29; still sick August 31. At Fort McPherson this case was diagnosed typhoid fever.
- No. 16. Company I: Typhoid fever, June 29; still sick August 31.
- No. 17. Company I: Tertian malaria, June 29; still sick August 31.
- No. 18. Company F: Typhoid fever, June 29 to July 25.
- No. 19. Company E: Intermittent malaria, June 29 to July 28.
- No. 20. Company D: Intermittent malaria, July 1 to 15.
- No. 21. Company G: Typhoid fever, July 2; still sick August 31.
- No. 22. Company C: Intermittent malaria, July 2 to 28.
- No. 23. Company H: Typhoid fever, July 3; still sick August 31.
- No. 24. Company I: Typhoid fever, July 3; furloughed from Leiter Hospital October 22.
- No. 25. Company I: Intermittent malaria, July 4 to 16.
- No. 26. No company: Remittent malaria, July 4; still sick August 31.
- No. 27. Company L: Typhoid fever, July 4; still sick August 31.
- No. 28. Company L: Remittent malaria, July 5; still sick August 31.
- No. 29. Company K: Typhoid fever, July 5; died in Leiter Hospital August 5.
- No. 30. Company L: Diarrhea, July 6 to August 9.
- No. 31. Company L: Intermittent malaria, July 6 to 27.
- No. 32. Company L: Intermittent malaria, July 6; still sick August 31.
- No. 33. Company L: Intermittent malaria, July 6 to 19.
- No. 34. Company M: Malaria, July 6; still sick August 31.

- No. 35. Company C: Typhoid fever, July 7; still sick August 31.
- No. 36. Company I: Intermittent malaria, July 7; still sick August 31.
- No. 37. Company H: Intermittent malaria, July 7 to 24.
- No. 38. Company K: Continued fever, July 8; still sick August 31.
- No. 39. Company I: Remittent malaria, July 8 to August 1.
- No. 40. Company G: Remittent malaria, July 9 to 24.
- No. 41. Company D: Gastro-enteritis, July 9; still sick August 31. In the division hospital this case was diagnosed typhoid fever.
- No. 42. Company A: Typhoid fever, July 9; still sick August 31.
- No. 43. Company C: Intermittent malaria, July 9 to August 9. In the hospital this case was diagnosed typhoid fever.
- No. 44. Company E: Malaria, July 9 to 29.
- No. 45. Company C: Typhoid fever, July 9; died in hospital October 17.
- No. 46. Company F: Typhoid fever, July 10; still sick August 31.
- No. 47. Company C: Intermittent malaria, July 10; still sick August 31. In the hospital this case was diagnosed typhoid fever.
- No. 48. Company F: Typhoid fever, July 11; still sick August 31.
- No. 49. Company G: Remittent malaria, July 11; still sick August 31.
- No. 50. Company G: Continued fever, July 11 to August 2.
- No. 51. Company L: Malaria, July 12; still sick August 31.
- No. 52. Company F: Intermittent malaria, July 12 to August 3.
- No. 53. Company I: Remittent malaria, July 13; still sick August 31.
- No. 54. Company I: Intermittent malaria, July 13; still sick August 31.
- No. 55. No company: Intermittent malaria, July 14; still sick August 31.
- No. 56. Company A: Remittent malaria, July 14 to August 16.
- No. 57. Company G: Typhoid fever, July 14; still sick August 31.
- No. 58. Company D: Typhoid fever, July 14 to August 9.
- No. 59. Company D: Typhoid fever, July 14; still sick August 31.
- No. 60. Company F: Remittent malaria, July 14; still sick August 31.
- No. 61. Company D: Intermittent malaria, July 14; still sick August 31.
- No. 62. Company B: Remittent malaria, July 14; still sick August 31.
- No. 63. Company C: Remittent malaria, July 15 to 29.
- No. 64. Company F: Typhoid fever, July 15; still sick August 31.
- No. 65. Company F: Malaria, July 15 to August 9.
- No. 66. Company A: Diarrhea, July 15 to August 4.
- No. 67. Company H: Typhoid fever, July 16; still sick August 31.
- No. 68. Company B: Intermittent malaria, July 16 to August 14. In the division hospital this case was diagnosed typhoid fever.
- No. 69. Company L: Typhoid fever, July 16; still sick August 31.
- No. 70. Company M: Diarrhea, July 18; still sick August 31. In the hospital this case was diagnosed typhoid fever.
- No. 71. Company C: Typhoid fever, July 18; still sick August 31. This man is recorded as having had diarrhea June 15 to 20.
- No. 72. Company H: Intermittent malaria, July 18; still sick August 31.
- No. 73. Company L: Remittent malaria, July 18; still sick August 31.
- No. 74. Company G: Remittent malaria, July 18; still sick August 31. In the hospital this case was diagnosed typhoid fever.
- No. 75. Company K: Continued fever, July 19 to August 19.
- No. 76. Company F: Typhoid fever, July 19 to August 31.
- No. 77. Company I: Typhoid fever, July 19; still sick August 31.
- No. 78. Company B: Intermittent malaria, July 20 to August 14. In the hospital this case was diagnosed typhoid fever.
- No. 79. Company A: Typhoid fever, July 20; still sick August 31.
- No. 80. Company H: Typhoid fever, July 21; died in hospital August 17.
- No. 81. Company E: Typhoid fever, July 21; still sick August 31.
- No. 82. Company F: Intermittent malaria, July 21 to August 16.
- No. 83. Company F: Typhoid fever, July 21; still sick August 31.

No. 84. Company M: Intermittent malaria, July 21; still sick August 31.

No. 85. Company E: Typhoid fever, July 23; still sick August 31.

No. 86. Company K: Intermittent malaria, July 23; still sick August 31.

No. 87. Company C: Without date or diagnosis; sent to Leiter Hospital July 23. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 14.

No. 88. Company G: Diarrhea, July 24 to August 21.

No. 89. Company A: Typhoid fever, July 24; still sick August 31.

No. 90. Company L: Typhoid fever, July 24; died in hospital August 2. In the hospital this case was diagnosed malaria.

No. 91. Company E: Typhoid fever, July 24; died in hospital August 2.

No. 92. Company K: Intermittent malaria, July 25; still sick August 31.

No. 93. Company C: Typhoid fever, July 26; still sick August 31.

No. 94. Company C: Intermittent malaria, July 26; still sick August 31.

No. 95. Company C: Diarrhea, July 26; still sick August 31. In the hospital this case was diagnosed typhoid fever.

No. 96. Company I: Undetermined fever, July 26; still sick August 31.

No. 97. Company I: Undetermined fever, July 27; still sick August 31. In the hospital this case was diagnosed typhoid fever.

No. 98. Company M: Remittent malaria, July 28; still sick August 31.

No. 99. Company E: Undetermined fever, July 28 to August 18.

No. 100. Company E: Continued fever, July 28; died in hospital September 1. In the hospital this case was diagnosed typhoid fever.

No. 101. Company K: Diarrhea, July 29; still sick August 31.

No. 102. Company D: Undetermined fever, July 30; still sick August 31.

No. 103. Company C: Intermittent malaria, July 30; still sick August 31.

No. 104. Company D: Undetermined fever, July 30 to August 30.

No. 105. Company A: Diarrhea, July 30; still sick August 31.

No. 106. Company D: Diarrhea, July 30; still sick August 31.

No. 107. Company I: Intermittent malaria, July 30; still sick August 31. In the hospital this case was diagnosed typhoid fever.

No. 108. Company C: Intermittent malaria, July 30; still sick August 31. In the hospital this case was diagnosed typhoid fever.

No. 109. Company G: Undetermined fever, July 30; still sick August 31.

No. 110. Company D: Remittent malaria, July 30 to August 26.

No. 111. Company I: Remittent malaria, July 30; still sick August 31.

No. 112. Company A: Continued fever, July 30; still sick August 31.

No. 113. Company C: Undetermined fever, July 30; still sick August 31.

No. 114. Company F: Typhoid fever, July 31 to September 14.

No. 115. Company F: Typhoid fever, July 31; furloughed August 8. This man is recorded as having been returned to duty August 8; this must be a mistake.

No. 116. Company B: Intermittent malaria, August 1; still sick August 31.

No. 117. Company E: Typhoid fever, August 1; still sick August 31.

No. 118. Company C: Intermittent malaria, August 1; still sick August 31.

No. 119. Company F: Intermittent malaria, August 1; furloughed from division hospital August 27.

No. 120. Company C: Typhoid fever, August 1; furloughed from division hospital August 22.

No. 121. Company G: Continued fever, August 1; still sick in division hospital August 31.

No. 122. Company A: Undetermined fever, August 1; died in division hospital August 24.

No. 123. Company I: Intermittent malaria, August 1; furloughed from division hospital August 10.

No. 124. Company C: Intermittent malaria, August 1; furloughed from division hospital August 25.

No. 125. Company C: Undetermined fever, August 2; furloughed from division hospital August 22.

No. 126. Company K: Undetermined fever, August 2; died in division hospital September 3. In the hospital this case was diagnosed typhoid fever.

No. 127. Company C: Undetermined fever, August 3; furloughed from division hospital August 27.

No. 128. Company I: Remittent malaria, August 3; furloughed from division hospital August 13.

No. 129. Company A: Continued fever, August 3; furloughed from division hospital August 23.

No. 130. Company M: Intermittent malaria, August 3; furloughed from division hospital August 22.

No. 131. Company C: Undetermined fever, August 3; still sick August 31.

No. 132. Company K: Remittent malaria, August 3; still sick August 31.

No. 133. Company C: Undetermined fever, August 3; furloughed from division hospital August 22.

No. 134. Company H: Typhoid fever, August 3; furloughed from division hospital September 16.

No. 135. Company K: Undetermined fever, August 4; furloughed from division hospital August 17.

No. 136. Company C: Undetermined fever, August 4; furloughed from division hospital August 20.

No. 137. Company A: Continued malaria, August 4; furloughed from Sternberg Hospital September 7.

No. 138. Company K: Undetermined fever, August 4; furloughed from division hospital August 18.

No. 139. Company C: Undetermined fever, August 4; furloughed from division hospital August 28.

No. 140. Company G: Undetermined fever, August 4; furloughed from division hospital August 20.

No. 141. Company B: Undetermined fever, August 4; furloughed from division hospital August 18.

No. 142. Company C: Malarial fever, August 4; furloughed from division hospital August 22.

No. 143. Company L: Undetermined fever, August 4; furloughed from division hospital August 14.

No. 144. Company E: Continued fever, August 4; furloughed from division hospital August 23.

No. 145. Company E: Continued fever, August 5; still sick in hospital August 31.

No. 146. Company C: Continued fever, August 5; furloughed from division hospital August 22.

No. 147. Company C: Intermittent malaria, August 5; furloughed from division hospital August 19.

No. 148. Company D: Undetermined fever, August 5; furloughed from division hospital August 22.

No. 149. Company B: Typhoid fever, August 5; furloughed from division hospital August 18.

No. 150. Company H: Undetermined fever, August 6; furloughed from division hospital August 22.

No. 151. Company L: Intermittent malaria, August 6; furloughed from division hospital August 17.

No. 152. Company K: Undetermined fever, August 6; furloughed from division hospital August 18.

No. 153. Company K: Diarrhea, August 6; furloughed from division hospital August 22. In the hospital this case was diagnosed continued fever.

No. 154. Company K: Undetermined fever, August 6; furloughed from division hospital August 22.

No. 155. Company H: Undetermined fever, August 6; furloughed from division hospital August 21.

No. 156. Company B: Typhoid fever, August 6; died in division hospital August 22.

No. 157. Company B: Typhoid fever, August 6; furloughed August 27. In the hospital this case was diagnosed continued fever.

No. 158. Company C: Undetermined fever, August 7; furloughed from Leiter Hospital August 31. In division hospital this case was diagnosed continued fever; in Leiter Hospital it was diagnosed typhoid fever. We have, therefore, three diagnoses—a regimental diagnosis of undetermined fever, a diagnosis in division hospital of continued fever, and a diagnosis in Leiter Hospital of typhoid fever.

No. 159. Company B: Malaria, August 7; furloughed from hospital September 27.

No. 160. Company C: Typhoid fever, August 7; died in Leiter Hospital August 26.

No. 161. Company E: Typhoid fever, August 7; still sick in division hospital August 31.

No. 162. Company B: Continued fever, August 7; died in Sternberg Hospital September 7.

No. 163. Company C: Undetermined fever, August 7; furloughed from division hospital August 12.

No. 164. Company C: Undetermined fever, August 7; still sick in Sternberg Hospital September 30.

No. 165. Company G: Intermittent malaria, August 7; furloughed from division hospital August 22.

No. 166. Company L: Continued fever, August 7; still sick August 31.

No. 167. Company H: Continued fever, August 7; still sick August 31.

No. 168. Company B: Continued fever, August 7; furloughed from division hospital August 18.

No. 169. Company D: Undetermined fever, August 7; still sick in division hospital August 31.

No. 170. Company C: Undetermined fever, August 7; furloughed from division hospital August 23.

No. 171. Company E: Intermittent malaria, August 7; still sick in division hospital August 31.

No. 172. Company K: Intermittent malaria, August 7; furloughed from division hospital August 18.

No. 173. Company C: Undetermined fever, August 7; furloughed from division hospital August 26.

No. 174. Company not given: Typhoid fever, August 7; furloughed from hospital August 23.

No. 175. Company F: Intermittent malaria, August 7; furloughed from division hospital September 10. In the hospital this case was diagnosed typhoid fever.

No. 176. Company E: Continued fever, August 7; furloughed from division hospital August 14.

No. 177. Company K: Intermittent malaria, August 8; furloughed August 21.

No. 178. Company L: Typhoid fever, August 8; still sick in Sternberg Hospital August 31.

No. 179. Company A: Diarrhea, August 8 to 30.

No. 180. Company H: Undetermined fever, August 8; furloughed from Leiter Hospital September 14. In Leiter Hospital this case was diagnosed typhoid fever.

No. 181. Company C: Typhoid fever, August 8 to September 14.

No. 182. Company G: Typhoid fever, August 8; furloughed August 26.

No. 183. Company L: Undetermined fever, August 8; furloughed August 26.

No. 184. Company A: Intermittent malaria, August 8; furloughed from division hospital August 21.

No. 185. Company I: Continued fever, August 8; furloughed from division hospital August 17.

No. 186. Company C: Remittent malaria, August 9; still sick in division hospital August 31.

No. 187. Company I: Diarrhea, August 9; furloughed from divi-

sion hospital August 22. In the hospital this case was diagnosed continued fever.

No. 188. Company C: Undetermined fever, August 9; furloughed from division hospital August 23.

No. 189. Company C: Dysentery, August 10; furloughed from division hospital August 21. In the hospital this case was diagnosed diarrhea.

No. 190. Company B: Typhoid fever, August 10; furloughed from division hospital September 11.

No. 191. Company G: Remittent malaria, August 10; furloughed from Leiter Hospital September 24. In the hospital this case was diagnosed typhoid fever.

No. 192. Company I: Undetermined fever, August 11; furloughed from division hospital September 1.

No. 193. Company B: Remittent malaria, August 11; furloughed from division hospital August 25.

No. 194. Company H: Diarrhea, August 11; furloughed from division hospital August 25.

No. 195. Company K: Intermittent malaria, August 11; furloughed August 21.

No. 196. Company H: Diarrhea, August 11; furloughed August 27.

No. 302. Company A: Typhoid fever September 2; furloughed from division hospital October 22.

No. 303. Company F: Typhoid fever, September 3; furloughed from Leiter Hospital September 14.

No. 304. Company A: Typhoid fever, September 3; furloughed from Leiter Hospital October 13.

No. 305. Company B: Typhoid fever, September 3; furloughed from Leiter Hospital September 9.

No. 306. Company A: Typhoid fever, September 3; furloughed from Leiter Hospital September 14.

No. 307. Company E: Typhoid fever, September 3; furloughed from Leiter Hospital September 5.

No. 308. Company L: Typhoid fever, September 3; furloughed from Leiter Hospital September 14.

No. 309. Company M: Typhoid fever, September 3; furloughed from Leiter Hospital September 27.

No. 310. Company B: Typhoid fever, September 3; furloughed from Leiter Hospital October 13.

No. 311. Company B: Typhoid fever, September 3; furloughed from Leiter Hospital September 14.

No. 312. Company G: Continued malaria, September 5; furloughed from Sternberg Hospital September 8.

No. 313. Company B: Typhoid fever, September 5; furloughed from Sternberg Hospital October 4.

No. 314. Company B: Typhoid fever, September 5; died in Sternberg Hospital September 14.

No. 315. Company M: Typhoid fever, September 9; furloughed from Sternberg Hospital November 5.

No. 316. Company L: Typhoid fever, September 10; furloughed from Sternberg Hospital October 8.

No. 317. Company M: Typhoid fever, September 11; furloughed from Sternberg Hospital October 8.

No. 318. Company H: Continued malaria, September 12; furloughed from Sternberg Hospital September 21.

No. 319. Company I: Typhoid fever, September 12; furloughed from Sternberg Hospital October 13.

No. 320. Company C: Typhoid fever, September 12; furloughed from Sternberg Hospital November 5.

No. 321. Company I: Typhoid fever, September 12; furloughed from Sternberg Hospital November 13.

No. 322. Company D: Remittent malaria, September 12; furloughed from Sternberg Hospital September 25.

No. 323. Company H: Typhoid fever, September 12; furloughed from Sternberg Hospital November 5.

The cases in the above list sent to Sternberg Hospital and Leiter Hospital were sent to hospital without diagnosis.

SUMMARY.

Assembled at the armory, 125 West Fourteenth street, New York City. Left May 2, 1898, for Peekskill, N. Y.

Mustered into United States service May 10, 1898.

Arrived at Chickamauga Park, Ga., May 26, 1898.

Strength on arrival, 1,025.

Date of first case of probable typhoid fever, June 10, 1898.

Date of first case of recognized typhoid fever, June 13, 1898.

Left Chickamauga Park, Ga., September 14, 1898.

Strength on departure, 1,292.

Number of cases of probable typhoid fever developed while at Chickamauga 323

Total number of cases of probable typhoid fever developed in the Ninth New York Volunteer Infantry from May to September, 1898 323

These 323 cases were diagnosed as follows:

Typhoid fever.....	139
Enteric fever.....	3
Malaria.....	85
Diarrhea.....	12
Continued fever.....	31
Undetermined fever.....	52
Dysentery.....	1
Total.....	323

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Adler, Frederick	Pvt., L.	1898. Sept. 22	St. Joseph's Hospital, Lexington, Ky.	Typhoid.
Blake, James	Pvt., G.	Aug. 21	New York City	Do.
Buhr, John E.	Corpl., F.	Aug. 25	Leiter Hospital.....	Do.
Burkhardt, Chas.	Pvt., H.	Sept. 2	New York City	Do.
Byrnes, G. V.	Corpl., G.	Oct. 18	do	Do.
Connell, Thomas	Pvt., F.	Oct. 13	do	Do.
Costard, E. P., jr.	Pvt., D.	Aug. 1	Fort McPherson, Ga.	Do.
Cox, George	Band.	Aug. 26	Camp Thomas, Ga.	Do.
Crane, Thomas B.	Pvt., E.	Oct. 26	New York Hospital, N. Y.	Do.
Dean, Frank J.	Corpl., C.	Aug. 26	Camp Thomas, Ga.	Do.
Dodd, Samuel A.	Pvt., M.	Aug. 29	do	Do.
Donohue, M. F.	Sgt., A.	Oct. 2	New York City	Do.
Dowd, William	Pvt., H.	Oct. 24	Presbyterian Hospital, New York City.	Typhoid; intestinal hemorrhage and peritonitis.
Eckstein, A.	Pvt., A.	Aug. 9	Fort McPherson, Ga.	Typhoid.
Ewing, Joseph E.	Pvt., B.	Sept. 8	Chickamauga, Ga.	Do.
Falthe, P. H.	Pvt., H.	Aug. 16	Second Division Hospital, Third Army Corps.	Do.
Gephard, Edward	1st sgt., K.	Sept. 22	Hospital, New York ..	Typhoid and peritonitis.
Hubacher, Herman ..	Pvt., M.	Oct. 30	New York City	Typhoid.
Kiefer, J. F.	Pvt., I.	Sept. 4	do	Do.
Koch, Gustave	Pvt., G.	Nov. 5	do	(Typhoid); acute toxic gastritis
Lawrence, W. H.	Pvt., G.	Oct. 2	do	Typhoid.
Lebeck, C. C.	Pvt., L.	Aug. 2	Camp Thomas, Ga.	Do.

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Lynch, Thomas	Pvt., K.	1898. July 10	(Typhoid). acute malarial enteritis.
Mahoney, M. J.	1st Lt., A.	Oct. 3	New York City	Typhoid.
Merriek, C. M.	Pvt., M.	Aug. 26	do	(Typhoid): malaria and dysentery.
Metz, Edward	Pvt., M.	Sept. 4	Camp Thomas, Ga.	Typhoid.
Moore, Frank	Corpl., L.	do	do	Do.
Moore, Warren J.	Pvt., K.	Aug. 29	do	Do.
Nauheimer, John	Pvt., A.	do	Chickamauga, Ga.	Do.
Nelle, Robert E.	Pvt., F.	Oct. 17	New York City	(Typhoid).
O'Shaughnessy, F. J.	Pvt., C.	Sept. 21	do	Typhoid.
Reardon, George	Pvt., E.	Aug. 2	Camp Thomas, Ga.	Do.
Reiner, Henry	Pvt., K.	July 22	do	Do.
Ryba, Charles	Pvt., L.	Sept. 25	Fort Thomas, Ky.	(Typhoid): uræmic coma.
Seward, C. W.	2d Lt., C.	Sept. 16	His home, Montclair, N. J.	Typhoid.
Seward, E., jr.	1st Lt., C.	Oct. 17	Leiter U. S. General Hospital, Chickamauga, Ga.	Do.
Shannon, James P.	Pvt., K.	Sept. 3	Chickamauga, Ga.	Do.
Simpson, G. McC.	Pvt., B.	Aug. 23	do	Do.
Stoffers, George H.	Corpl., B.	Oct. 9	do	Do.
Stofflet, C. A.	Pvt., M.	Sept. 17	New York City	Do.
Stone, William	— B.	Sept. 14	Chickamauga, Ga.	Do.
Syuart, F. J.	Sgt., M.	Sept. 10	New York City	Do.
Wald, Frederick	Pvt., E.	Sept. 1	Camp Thomas, Ga.	Do.
Walker, F. D. L.	1st Lt., H.	Sept. 20	New York City	Do.
Watson, John W.	Corpl., M.	Oct. 5	St. Catherine's Hospital, Brooklyn, N. Y.	Do.
White, George	Pvt., M.	Sept. 25	Saranac Lake, N. Y.	Do.
Total deaths				46
Deaths due to typhoid fever				46
Percentage of deaths among probable cases of typhoid fever (323), 14.24.				
Percentage of deaths among recognized cases of typhoid fever (139), 33.09.				

We inspected this regiment September 10, 1898. The following is taken from our stenographic notes made at that inspection.

There are three battalion sinks. It is supposed that these were filled with straw and burned out each morning. This attempt at disinfection is practically worthless. Fecal matter is seen deposited around trees and elsewhere on the ground. A vile odor permeates the air around the sinks.

We wish here to speak of the attempts made by different regiments at Chickamauga to disinfect the sinks by means of burning straw. Straw was collected from the corrals every morning, thrown into the sink, and set on fire. This attempt at disinfection was practically worthless. Frequently it happened that the straw was wet and did not burn at all. In some instances the straw on top burned, but the large amount of water in the sink prevented disinfection of its contents.

The following is a condensed statement of the information which we obtained from Maj. Samuel D. Hubbard, surgeon of this regiment:

This regiment assembled at Peekskill, N. Y., in April, and was mustered into the service of the United States early in May. The water supply at Peekskill is abundant and above suspicion. It comes from the Catskill Mountains. The site at Peekskill occupies a large plateau facing the Hudson River and elevated some 200 feet above it. The regiment left Peekskill May 24 without a sick man and arrived at Chickamauga, Ga., May 26. For some time after arriving at Chickamauga water was hauled from Crawfish Spring; later, pipes carrying the Chickamauga Creek water were laid through the encampment. We had three large sinks, one for each battalion. These were located about 80 feet from the kitchens. When these were partially filled their contents were covered and new sinks were dug back farther and at a distance of

about 200 feet from the kitchens. We endeavored to cover the contents of these sinks with sand and with dust swept up in the regimental camp and by burning straw in the pits. I made a sanitary inspection of the camp twice each day. During the first days we had difficulty in getting tools necessary to dig the sinks, and during this time the men defecated on the ground. When we obtained the tools we covered the fecal matter where it lay on the ground, but did not take it up. The drainage from the hills occupied by the Second Kentucky Volunteer Infantry ran through our camp.

We had great difficulty in digging sinks to a depth of 3 or more than 3½ feet. In attempting to dig these sinks we encountered large boulders which had to be blasted or broken inside of the sinks. We obtained some water from driven wells. The water from these wells became muddy after heavy rains. During the early part of June we had a great deal of diarrhea, which I attributed largely to the fact that men bought questionable food from hucksters and ate largely of it.

When asked concerning the possibility of water that was hauled from springs in barrels being contaminated, Major Hubbard told us that in one of the Wisconsin regiments a man had been found hidden in an empty barrel on a wagon on its way to the spring to be filled with water. The man used this means to pass the guard.

Major Hubbard one morning found fecal matter deposited in an empty barrel where some one had defecated in this barrel during the night. The barrel was immediately broken up and burned.

The tents were without flooring for some months after the arrival of the troops. In attempting to keep the tents dry the men dug ditches around them, and some of these were dug so deep and so large that water stood in them.

Major Hubbard believed that the men of his regiment became infected with typhoid fever on account of their association with infected men in the First Mississippi. In fact, many medical officers at Chickamauga looked upon the First Mississippi as the regiment which brought the infection of typhoid fever into the park. As we shall see later, the First Mississippi did undoubtedly bring typhoid fever to Chickamauga, but this is equally true of the great majority of the other regiments. We will probably take up this point later.

In regard to this matter Major Hubbard made the following statement:

The First Mississippi brought the first case of typhoid fever to the division hospital, and about that time the men from the two regiments were doing a great deal of visiting, and the first thing I knew typhoid fever began to crop out in our own regiment. I think that the disease was spread by the intermingling of the soldiers of these regiments.

On June 10 Major Hubbard was detached from his regiment and sent to the division hospital. He stated that more than 90 per cent of the cases of typhoid fever brought to this hospital were not properly diagnosed by the regimental surgeon.

After Major Hubbard had been detached from this regiment to the hospital Capt. John B. L'Honnmedieu became senior medical officer of this regiment. Cap-

tain L'Hommedieu, in his testimony to us, stated that he did not believe that typhoid fever appeared in the Ninth New York until July 6. This is an evidence of how untrustworthy memory and general impressions may be. The regimental records show that a disease diagnosed as enteric fever appeared in this regiment as early as June 13, and that numerous cases had appeared, some with a diagnosis of typhoid fever, before July 6. On this point Captain L'Hommedieu made the following statement:

Cases of typhoid fever began to straggle in. The diagnosis could not be made with certainty until they passed out of our hands. We were having a great many cases of remittent malaria, and some of these proved to be typhoid fever. We had no hospital in the regiment. Men were seen in quarters and were picked up and transferred to the division hospital. Our examination was slight, and we were not able to make a positive diagnosis. Perhaps we would not hear of the development of these cases of typhoid fever until two or three weeks had elapsed.

He thought that the great influx of typhoid fever began about the 15th of July. This increase in the number of cases of typhoid fever caused this command to change its water supply from the piped water of Chickamauga Creek to that obtained from Blue Springs. An attempt was made to filter all of the water used by this brigade, but the amount obtained in this way was insufficient.

When asked his opinion as to the origin of typhoid fever in the Ninth New York Volunteer Infantry, Captain L'Hommedieu made the following statement:

There was a case of typhoid fever in a family living not far from our camp. That was the first case of typhoid fever I heard of; later a case appeared in the First Mississippi. This was the first that occurred in our division, and then there was quite a number of cases in the First Mississippi. Some time later on we had a case in the Ninth New York, and the disease began to spread, I think, from the sinks. I do not think that we were ever able to disinfect the sinks as it should have been done. On at least two occasions the sinks overflowed and polluted the ground for a distance of about 10 feet about them. Great difficulty was experienced in preventing the men from defecating around the camp, especially during the night. Men with diarrhea would get up at night and going to the sink they would stop half way, and in the morning I would find a great deal of excrement deposited on the ground. In all cases I attempted to have this removed immediately, but this attempt was not always successful. Sometimes the fecal matter was covered where it was deposited. The garbage was burned.

According to Captain L'Hommedieu the men of this regiment did not have access to water from driven wells.

It will be noticed that in number of deaths from typhoid fever this regiment leads all others at Chickamauga.

COMMUNICATIONS FROM THE SURGEONS OF THE NINTH NEW YORK.

Medical officers.

Samuel D. Hubbard, major and surgeon, New York City.

Albert W. Preston, captain and assistant surgeon, New York City.

John B. L'Hommedieu, captain and assistant surgeon, New York City.

The following extracts are taken from a letter from Major Hubbard under date of July 16, 1899:

I desire to state that I was firmly convinced at the time that the great majority of the cases diagnosed as "undetermined fever," "malaria," "diarrhea," etc., were typhoid fever. Early in June, 1898, I suggested to Major Bergen, of the Fifty-second Iowa, then in command of the Second Division hospital of the Third Army Corps, that it would be a wise plan to isolate in separate tents all cases suspected of being typhoid fever. Action was taken in accordance with this suggestion, but in a short time the number of cases was beyond our capacity for caring for them. I insisted at that time that we were on the verge of a typhoid epidemic. I took measures to secure disinfectants, but my claim that the disease prevalent at that time was typhoid fever raised against me the opposition of certain superior line officers. Therefore, it happened that for a time disinfectants were not only deficient, but none were to be had.

This regiment assembled in the armory at 125 West Fourteenth street, New York City, and on May 2, 1898, left by boat for Peekskill. During the stay of our regiment there were no cases of typhoid fever in that village. We remained in the State encampment until May 24, when we left for Chickamauga Park, Ga., arriving May 26, 1898.

The first case of typhoid fever appeared early in June; I should think about June 10 or 12.

Our first camp at Chickamauga was on a slope to the rear of the headquarters of the First Brigade of the Second Division of the Third Army Corps. It was located in the woods, and about 300 feet in the rear of our camp was a ditch about 4 feet deep. This ditch drained our camp and that of the First Arkansas.

During the first days of our stay in this camp, water was hauled by teams from any place where it could be obtained. Wagons were driven from pump to pump until, one after another, the wells were emptied. This fact alone convinced me that the water in these wells was surface water. Water obtained from the wells in our regiment was of a yellowish color and deposited, on standing, quite a sediment.

Later, pipe lines carrying Chickamauga Creek water were laid on top of the ground; two or three weeks later we were ordered to sink these pipes to a distance of 1 foot in the earth. This water was absolutely unfit for anything. It was not clear enough to serve as wash water. The deposit formed in a glass measured an inch in thickness. It was as yellow as saffron and contained floating particles. It was absolutely impossible to filter this water. Later, water was obtained from Blue and Crawfish springs. This water was clear and more pleasing to the taste.

When the camp was laid out, we had no tools for the digging of sinks. I personally visited the company streets and asked the men to use the ditch at our rear until we could get tools with which to dig sinks. Night after night the space between the Ninth New York and the Fifth Missouri was lined with deposits of fecal matter. Not having spades with which to cover this, it was allowed to lie there and dry.

Flies became numerous, and as the kitchen was only 30 feet distant, it was only a question of time when the food would be contaminated. At last we obtained one pick and two shovels, and with these we dug a sink, but before we could finish and dig a second one the first one had been filled. Diarrheas now became common. Additional tools were obtained, and three battalion sinks were dug. Many men would not use the sinks on the plea that some of the men had body lice and left them on the seats. I obtained permission from the colonel of the regiment to arrest any man found defecating outside of the sinks. This order had some effect, but at night the nuisance was almost as bad as it had been in the daytime.

About this time I was transferred to the division hospital, and Captain L'Hommedieu became regimental surgeon. After going to the hospital I sent fifty specimens of blood to Washington, in

order that they might be subjected to a Widal test. About 90 per cent of these specimens gave positive results.

At the division hospital the shortage of orderlies caused a great many patients who were in no condition to get out of bed to walk a distance into the woods when they wished to defecate. At first the sheets were boiled, but soon the number of soiled sheets became so great that we were not able to care for them. After a while some of the dirty sheets were sent to the laundries in Chattanooga, and many others which were badly soiled were burned. At first the discharges from fever patients were dumped onto the fire, but the incineration was by no means complete. Sometimes an orderly would go to sleep, let the fire die out, and the discharges would be thrown on the ground. We then constructed a large sink for the reception of the discharges from the patients. As soon as this sink was filled to within 1 foot of the top it was covered with brushwood and dirt. From sinks thus covered the contents sometimes soaked through and contaminated the ground about, especially after heavy rains.

Powdered chloride of lime was kept in all the empty bedpans. After the bedpan had received the discharge from the patient a pint of water was added and the vessel with its contents allowed to stand for a few minutes outside of the tent; then the stool was emptied into the sink. A barrel of strong solution of lime was kept near the sink, and orderlies were instructed to wash the bedpans thoroughly in these barrels. After this had been done powdered chloride of lime was placed in the bedpan, which was returned to a bench outside of the tent, there to await another call. This sink was covered with a box with a lid, in order to keep the flies out. Straw was burned over the battalion sinks, but this was an inefficient attempt at sterilization.

Early in July, 1898, I recommended portable incinerators for camp use. This recommendation was, however, never accepted. I think that some light can be thrown on the high mortality in this regiment by a statement concerning the character of the men of which it was composed. I examined all the recruits for this regiment. I made 4,500 examinations in order to pick out 1,300 men. Practically all of the men belonged to one class. The only advantage that one man had over another was that the selected men did not have a physical deformity. These men belonged to the roving class of humanity. They were whisky-soaked, homeless wanderers, the majority of whom gave Bowery lodging houses as their places of residence. While other regiments from New York City had a fair proportion of men from the country, the recruits to the Ninth New York did not contain such men, or at least but few of them. Certainly this regiment was composed of a class of men likely to be susceptible to disease and in whom typhoid fever would be likely to prove fatal in an unusually large number of cases. The regiment was hastily recruited, and while the greatest care was used to get the best, the best had to be selected from the worst.

This regiment left Chickamauga Park September 14, 1898, and was mustered out November 16, 1898. Those sick after reaching New York were distributed to the various hospitals in that city. All the cases of typhoid fever which I can remember, and which I do not find in your report, are those of officers. I, myself, contracted typhoid fever September 29 and was sick until December 1. Major Weiners, Captain Meyer, and Lieutenants Lynch and Croft all had typhoid fever. I think that these are all that I do not see in your records.

The second location of our regiment at Chickamauga was in the open, and while it was much better than the first one, before we had moved typhoid fever had become so widely disseminated that it continued to spread.

FIRST ARKANSAS VOLUNTEER INFANTRY.

First Brigade, Second Division, Third Army Corps.

This regiment was mustered into the United States service at Little Rock, Ark., May 19, 1898, by Captain

Trippe of the Tenth Cavalry. The regiment left Little Rock on May 25 and arrived at Camp George H. Thomas, Chickamauga Park, Ga., May 27, 1898. The medical officer in charge was Maj. J. C. Minor.

CONDENSED SICK REPORT FOR MAY.

Mean strength, not given.	
Intermittent malaria.....	25
Remittent malaria.....	4
Diarrhea.....	24
Dysentery.....	2
Other diseases.....	41
Total.....	96

The June report is signed by Lieut. E. C. Hay, who makes the following statement:

The prevailing sicknesses in this regiment have been malarial manifestations, dyspepsia, and bowel irregularities. I consider that the drills in the hottest part of the day, the impure and unwholesome drinking water, responsible for a large portion of our sickness. I have experienced great trouble in having the company commanders carry out my instructions on hygiene. These malarial explosions have been induced by the change to higher altitude and the heavy drinking. The drill hour I have succeeded in having changed to the early hours of the morning and late hours of the evening, and think within a few weeks our sick percentage will be very much reduced.

CONDENSED SICK REPORT FOR JUNE.

Mean strength.....	1,191
Intermittent malaria.....	131
Remittent malaria.....	21
Acute diarrhea.....	103
Dysentery.....	11
Typhoid fever.....	14
Pernicious malaria.....	8
Other diseases.....	158
Total.....	446

The cases of pernicious and some of those of remittent malaria were probably typhoid fever. It will be seen that while this regiment reached Chickamauga Park on May 27 its first case of recognized typhoid fever appeared June 6, and numerous cases immediately followed. It is, therefore, a fair presumption that this regiment became infected before it left its camp at Little Rock, Ark. This must be regarded as one of the regiments which brought the typhoid infection into the camp at Chickamauga Park.

In the July report Lieutenant Hay makes the following statement:

I will state that the malarial manifestations have been greatly reduced this month, and what has occurred has been confined mostly to the recruits. The general health of the regiment has materially improved, but the sick list has been augmented by an invasion of measles and catarrhal inflammation of the mucous membranes, caused by the exposure of the men during this rainy spell while at rifle practice, and from the camp being pitched in the shade. A great deal of organic matter and garbage has been deposited between the different regiments, instead of being deposited at some remote point. These piles are putrefying, and emit very offensive fumes, and, of course, are anything but conducive to good health. The filters provided for the regiment have not

proven practicable, and I still urge that ample means be provided for boiling of all drinking water, which would materially reduce the number of enteric disturbances.

CONDENSED SICK REPORT FOR JULY.

Mean strength	1,343
Intermittent malaria.....	129
Remittent malaria.....	76
Acute diarrhea.....	47
Dysentery.....	11
Typhoid fever.....	19
Pernicious malaria.....	5
Other diseases.....	161
Total.....	448

Some of the typhoid cases included in this month are those brought over from the preceding month. Many of the cases of remittent malaria are greatly prolonged and undoubtedly are typhoid fever. However, we will look to the hospital reports for confirmation of this suspicion. It will be seen that typhoid fever did not abate in this regiment during the month of July.

The August report is signed by Lieut. C. P. Meriweather, who makes the following statement:

Malaria has been the prevailing disease during the past month. It has been brought about by the great amount of rain during June and July, and from the fact that all the regiments in the park skinned the ground of every particle of vegetable matter on the sites of their camps, and in most instances it was thrown in heaps near their own camp. The decomposition of this matter thus heaped up has produced more malaria than is usually found in the worse malarial districts. A great deal of acute and subacute bronchitis prevails in the regiment, from the fact that we have had measles in the regiment since mustering into service.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength	1,287
Intermittent malaria.....	211
Remittent malaria.....	76
Acute diarrhea.....	75
Dysentery.....	30
Pernicious malaria.....	3
Typhoid fever.....	5
Other diseases.....	328
Total.....	728

From this report it would appear that typhoid fever had greatly decreased since last month in this regiment. However, this is probably not the case, but the apparent decrease is more likely due to the change in surgeons.

The September report is signed by Maj. J. C. Minor, who states:

The regiment broke camp at Chickamauga Park, Ga., on September 8, 1898, and proceeded to Fort Logan H. Roots, Ark., arriving there September 10. The command is on furlough for one month from September 15, 1898.

CONDENSED SICK REPORT FOR SEPTEMBER.

This report covers a detachment of only about 120 men, all others having been discharged or furloughed. It also includes the sick sent to the hospitals at Chickamauga Park before leaving that place.

Intermittent malaria.....	95
Remittent malaria.....	3
Acute diarrhea.....	9
Dysentery.....	3
Typhoid fever.....	3
Other diseases.....	84
Total.....	197

It would appear from this report that this regiment had by this time become almost free from typhoid fever. However, we are inclined to think that this is more apparent than real.

We have what appears to be a sick report for this regiment for the month of October, but it shows only 82 cases in all; and none of these are of special interest to us, except the cases given in previous reports. In several of these the diagnosis has been changed from malaria to typhoid fever. There seems to have been one death from tobacco narcotism, and another serious case of illness from the same cause. Most of the cases reported are the so-called intermittent and remittent malarias of only a few days' duration. If we were to accept this record as that of the regiment for the month of October, it must be admitted that going on furlough practically relieved the regiment from all serious illness.

The following is a list of the recognized and probable cases of typhoid fever in this regiment:

No. 1. Company F: Without date or diagnosis; sent to division hospital June 2. Here the disease was diagnosed intermittent malaria, and the man was returned to duty June 13.

No. 2. Company C: Typhoid fever, June 3 to August 2.

No. 3. Company I: Typhoid fever, June 6; furloughed July 21.

No. 4. Company A: Without date or diagnosis; sent to division hospital June 6. Here the disease was diagnosed dysentery, and the patient was returned to duty June 19.

No. 5. Company C: Typhoid fever, June 7; furloughed July 11.

No. 6. Company F: Without date or diagnosis; sent to division hospital June 8. Here the disease was diagnosed remittent malaria, and the patient was furloughed June 14.

No. 7. Company M: Dysentery, June 10; granted sick leave without date. There is no record of this man having returned to duty at any time.

No. 8. Company M: Without date or diagnosis; sent to Leiter Hospital June 10. Here the disease was diagnosed remittent malaria, and the patient was furloughed July 27.

No. 9. Company L: Typhoid fever, June 10 to July 25.

No. 10. Company L: Typhoid fever, June 10; discharged July 17.

No. 11. Company C: Without date or diagnosis; sent to division hospital June 11. Here the disease was diagnosed remittent malaria, and the man returned to duty July 7.

No. 12. Company I: Without date or diagnosis; sent to division hospital June 12. Here the disease was diagnosed intermittent malaria, and the patient was furloughed June 21.

No. 13. Company L: Without date or diagnosis; sent to division hospital June 13. Here the disease was diagnosed typhoid fever, and the patient was returned to duty July 5.

No. 14. Company K: Typhoid fever, June 14; died July 9.

No. 15. Company H: Without date or diagnosis; sent to hospital June 15. Here the disease was diagnosed typhoid fever. The further disposition of this patient is not given.

No. 16. Company B: Typhoid fever, June 15; furloughed June 29.

No. 17. Company F: Without date or diagnosis; sent to division hospital June 15. Here the disease was diagnosed dysentery, and the patient was returned to duty July 9.

No. 18. Company A: Dysentery, June 16; granted sick leave without date. There is no evidence that this man returned to duty.

No. 19. Company F: Without date or diagnosis; sent to division hospital June 16. Here the disease was diagnosed remittent malaria, and the patient was returned to duty July 2.

No. 20. Company E: Malaria, June 16; granted sick leave June 22. There is no evidence that this man ever returned to duty.

No. 21. Company M: Without date or diagnosis; sent to division hospital June 18. Here the disease was diagnosed typhoid fever. The further disposition of this patient is not given.

No. 22. Company D: Typhoid fever, June 18 to July 12.

No. 23. Company H: Without date or diagnosis; sent to division hospital June 18. Here the disease was diagnosed typhoid fever, and the patient was transferred to Leiter Hospital July 12.

No. 24. Company H: Without date or diagnosis; sent to division hospital June 18. Here the disease was diagnosed remittent malaria, and the patient remained sick July 31.

No. 25. Company L: Without date or diagnosis; sent to division hospital June 19. Here the disease was diagnosed typhoid fever. The further disposition of this patient is not given.

No. 26. Company G: Typhoid fever, June 19 to July 26.

No. 27. Company K: Without date or diagnosis; sent to division hospital June 19. Here the disease was diagnosed remittent malaria, and the patient was returned to duty July 27.

No. 28. Company D: Without date or diagnosis; sent to division hospital June 21. Here the disease was diagnosed typhoid fever, and the patient was furloughed July 7.

No. 29. Company D: Typhoid fever, June 21; died July 21.

No. 30. Company L: Typhoid fever, June 22; furloughed August 17.

No. 31. Company A: Typhoid fever, June 22; furloughed July 21.

No. 32. Company I: Typhoid fever, June 23; died July 16.

No. 33. Company C: Typhoid fever, June 24; furloughed July 16.

No. 34. Company not given. Without date or diagnosis; sent to division hospital June 24. Here the disease was diagnosed remittent malaria, and the patient was furloughed July 10.

No. 35. Company D: Typhoid fever, June 24 to July 18.

No. 36. Company D: Without date or diagnosis; sent to division hospital June 24. Here the disease was diagnosed remittent malaria, and the patient was returned to duty July 15.

No. 37. Company E: Without date or diagnosis; sent to division hospital June 24. Here the disease was diagnosed remittent malaria, and the patient was returned to duty July 14.

No. 38. Company I: Without date or diagnosis; sent to division hospital June 24. Here the disease was diagnosed intermittent malaria, and the patient was furloughed July 2.

No. 39. Company F: Without date or diagnosis; sent to division hospital June 24. Here the disease was diagnosed remittent malaria, and the patient was returned to duty July 25.

No. 40. Company F: Typhoid fever, June 29; furloughed July 24.

No. 41. Company G: Without date or diagnosis; sent to division hospital June 30. Here the disease was diagnosed malaria, and the patient remained sick July 31.

No. 42. Company D: Typhoid fever, June 30 to August 9.

No. 43. Company F: Typhoid fever, July 1; sent to Fort McPherson July 25.

No. 44. Company M: Without date or diagnosis; sent to division hospital July 1. Here the disease was diagnosed remittent malaria, and the patient was furloughed July 14.

No. 45. Company F: Typhoid fever, July 2; furloughed August 10.

No. 46. Company A: Without date or diagnosis; sent to division hospital July 2. Here the disease was diagnosed intermittent malaria, and the patient was furloughed July 13.

No. 47. Company M: Without date or diagnosis; sent to division hospital July 2. Here the disease was diagnosed typhoid fever, and the patient was furloughed August 10.

No. 48. Company D: Typhoid fever, July 3; furloughed July 21.

No. 49. Company D: Typhoid fever, July 3; furloughed July 12.

No. 50. Company C: Typhoid fever, July 3; furloughed July 21.

No. 51. Company G: Without date or diagnosis; sent to division hospital July 5. Here the disease was diagnosed remittent malaria, and the patient was furloughed July 16.

No. 52. Company I: Typhoid fever, July 6; sent to Fort McPherson July 25.

No. 53. Company F: Without date or diagnosis; sent to division hospital July 7. Here the disease was diagnosed remittent malaria, and the patient was returned to duty July 26.

No. 54. Company L: Without date or diagnosis; sent to division hospital July 7. Here the disease was diagnosed remittent malaria, and the patient was furloughed July 15.

No. 55. Company F: Without date or diagnosis; sent to division hospital July 8. Here the disease was diagnosed remittent malaria, and the patient was furloughed July 18.

No. 56. Company I: Typhoid fever, July 9; sent to Fort McPherson July 24.

No. 57. Company C: Without date or diagnosis; sent to division hospital July 11. Here the disease was diagnosed intermittent malaria, and the patient was furloughed July 21.

No. 58. Company F: Typhoid fever, July 14; sent to Fort McPherson July 25.

No. 59. Company I: Without date or diagnosis; sent to division hospital July 15. Here the disease was diagnosed typhoid fever. The further disposition of this patient is not given.

No. 60. Company C: Without date or diagnosis; sent to division hospital July 15. Here the disease was diagnosed remittent malaria, and the patient remained sick in hospital July 31.

No. 61. Company G: Without date or diagnosis; sent to division hospital July 17. Here the disease was diagnosed typhoid fever, and the patient died July 21.

No. 62. Company L: Remittent malaria, July 17; furloughed August 26.

No. 63. Company I: Remittent malaria, July 18; furloughed August 19.

No. 64. Company H: Without date or diagnosis; sent to division hospital July 20. Here the disease was diagnosed remittent malaria, and the patient was furloughed August 1.

No. 65. Company M: Without date or diagnosis; sent to division hospital July 20. Here the disease was diagnosed intermittent malaria, and the patient was furloughed August 6.

No. 66. Company F: Diarrhea, July 21; furloughed August 10. This man had dysentery July 3 to 9.

No. 67. Company E: Intermittent malaria, July 21; furloughed August 25.

No. 68. Company F: Intermittent malaria, July 21; furloughed August 10.

No. 69. Company E: Without date or diagnosis; sent to division hospital July 21. Here the disease was diagnosed remittent malaria, and the patient was furloughed August 1.

No. 70. Company D: Remittent malaria, July 23; sent to division hospital without date. Here the disease was diagnosed typhoid fever, and the patient was furloughed August 20.

No. 71. Company F: Without date or diagnosis; sent to division hospital July 23. Here the disease was diagnosed typhoid fever. The further disposition of this patient is not given.

No. 72. Company F: Intermittent malaria, July 24; sent to division hospital without date. Here the diagnosis was changed to typhoid fever, and the patient was furloughed August 16. This man is reported as having had malaria from June 24 to July 9.

No. 73. Company L: Typhoid fever, July 24; furloughed August 31.

No. 74. Company L: Without date or diagnosis; sent to division hospital July 25. Here the disease was diagnosed remittent malaria, and the patient remained sick in the hospital August 31.

No. 75. Company L: Without date or diagnosis; sent to Leiter Hospital July 27; died August 7.

No. 76. Company F: Without date or diagnosis; sent to division hospital July 27. Here the disease was recorded as undetermined fever, and the patient was furloughed August 27.

No. 77. Company M: Without date or diagnosis; sent to division hospital July 27. Here the disease was diagnosed remittent malaria, and the patient remained sick in hospital August 31.

No. 78. Company C: Without date or diagnosis; sent to division hospital July 27. Here the disease was diagnosed remittent malaria, and the patient remained sick in hospital August 31.

No. 79. Company H: Without date or diagnosis; sent to division hospital July 27. Here the disease was diagnosed remittent malaria, and the patient was furloughed August 5.

No. 80. Company M: Typhoid fever, July 29; furloughed September 26.

No. 81. Company A: Remittent malaria, July 30; furloughed July 30. There is no evidence that this man returned to duty at any time.

No. 82. Company A: Without date or diagnosis; sent to division hospital July 30. Here the disease was diagnosed typhoid fever. The further disposition of this patient is not given.

No. 83. Company C: Without date or diagnosis; sent to division hospital July 30. Here the disease was diagnosed dysentery and the patient remained sick in hospital August 31.

No. 84. Company E: Typhoid fever, July 31; sent to Leiter Hospital August 22.

No. 85. Company B: Without date or diagnosis; sent to division hospital July 31. Here the disease was diagnosed remittent malaria, and the patient remained sick in hospital August 31.

No. 86. Company C: Dysentery, July 31; died August 9.

No. 87. Company D: Without date or diagnosis; sent to division hospital July 31. Here the disease was diagnosed remittent malaria, and the patient remained sick in hospital August 31.

No. 88. Company H: Without date or diagnosis; sent to division hospital July 31. Here the disease was diagnosed continued fever, and the patient is recorded as having been returned to duty August 21.

No. 89. Company F: Remittent malaria, July 31; furloughed August 19.

No. 90. Company F: Without date or diagnosis; sent to division hospital August 1. Here the disease was diagnosed remittent malaria, and the patient was furloughed August 15.

No. 91. Company F: Without date or diagnosis; sent to division hospital August 1. Here the disease was diagnosed remittent malaria, and the patient was returned to duty August 15.

No. 92. Company G: Without date or diagnosis; sent to division hospital August 1. Here the disease was diagnosed intermittent malaria, and the patient was furloughed August 9.

No. 93. Company H: Remittent malaria, August 2; furloughed August 21.

No. 94. Company B: Without date or diagnosis; sent to division hospital August 2. Here the disease was diagnosed continued fever, and the patient remained sick in hospital August 31.

No. 95. Company D: Diarrhea, August 2; furloughed August 21.

No. 96. Company B: Without date or diagnosis; sent to division hospital August 5. Here the disease was diagnosed continued fever, and the patient was furloughed August 27.

No. 97. Company C: Remittent malaria, August 5; sent to Sternberg Hospital August 18. The records of Sternberg Hospital do not contain the name of this man.

No. 98. Company C: Continued malaria, August 5; sent to Sternberg Hospital August 31. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 17.

No. 99. Company K: Without date or diagnosis; sent to division hospital August 5. Here the disease was diagnosed remittent malaria, and the patient was furloughed August 15.

No. 100. Company I: Intermittent malaria, August 6; furloughed August 21.

No. 101. Company B: Remittent malaria, August 7; furloughed August 30.

No. 102. Company D: Without date or diagnosis; sent to division hospital August 7, and transferred to Sternberg Hospital August 9. Here the case was diagnosed typhoid fever, but further disposition is not given.

No. 103. Company D: Intermittent malaria, August 8; furloughed August 27.

No. 104. Company L: Without date or diagnosis; sent to division hospital August 8. Here the disease was diagnosed dysentery, and the patient was furloughed August 18.

No. 105. Company M: Remittent malaria, August 10; furloughed August 21.

No. 106. Company M: Without date or diagnosis; sent to division hospital August 11. Here the disease was diagnosed typhoid fever, and the patient died August 29.

No. 107. Company H: Without date or diagnosis; sent to division hospital August 11. Here the disease was diagnosed continued fever, and the patient was furloughed August 18.

No. 108. Company G: Remittent malaria, August 11; furloughed August 27.

No. 109. Company E: Without date or diagnosis; sent to division hospital August 12. Here the disease was diagnosed intermittent malaria, and the patient was furloughed August 22.

No. 110. Company K: Intermittent malaria, August 12; furloughed August 25.

No. 111. Company M: Dysentery, August 12; furloughed August 17.

No. 112. Company not given: Diarrhea, August 12; furloughed August 21.

No. 113. Company A: Intermittent malaria, August 12; furloughed August 21.

No. 114. Company E: Intermittent malaria, August 12; furloughed August 28.

No. 115. Company H: Typhoid fever, August 13; died September 3.

No. 116. Company I: Continued malaria, August 13; furloughed August 27.

No. 117. Company B: Diarrhea, August 13; furloughed August 18.

No. 118. Company E: Intermittent malaria, August 13; furloughed August 23.

No. 119. Company H: Malaria, August 13; furloughed August 31. This man is recorded as having had malaria July 18 to 21.

No. 120. Company K: Remittent malaria, August 13; died August 27.

No. 121. Company B: Remittent malaria, August 13; furloughed August 30.

No. 122. Company B: Remittent malaria, August 13; furloughed August 22.

No. 123. Company B: Diarrhea, August 13; furloughed August 30.

No. 124. Company G: Intermittent malaria, August 14; furloughed August 30.

No. 125. Company H: Diarrhea, August 14; furloughed August 24.

No. 126. Company E: Dysentery, August 14; furloughed August 23. This man is recorded as having had malaria July 2 to 8, and again August 2 to 6.

No. 127. Company B: Without date or diagnosis; sent to division hospital August 14. Here the disease is recorded as undetermined fever, and the patient remained sick in hospital August 31.

No. 128. Company C: Without date or diagnosis; sent to division hospital August 14. Here the disease was diagnosed continued fever, and the patient remained sick in hospital August 31.

No. 129. Company M: Intermittent malaria, August 14; furloughed August 21.

No. 130. Company G: Without date or diagnosis; sent to division hospital August 14. Here the disease was diagnosed continued fever, and the patient was furloughed August 21.

No. 131. Company A: Intermittent malaria, August 15; sent to division hospital without date. Here the diagnosis was changed to typhoid fever, and the patient was furloughed August 27.

No. 132. Company A: Dysentery, August 15; furloughed August 21.
No. 133. Company E: Remittent malaria, August 15; still sick in hospital August 31.
No. 134. Company H: Intermittent malaria, August 15; furloughed August 28.
No. 135. Company D: Without date or diagnosis; sent to division hospital August 15. Here the disease was diagnosed continued fever, and the patient was furloughed August 17.
No. 136. Company C: Intermittent malaria, August 15; furloughed August 21.
No. 137. Company A: Dysentery, August 15; furloughed August 21.
No. 138. Company A: Dysentery, August 15; furloughed August 21. This man is recorded as having had dysentery July 3 to 9.
No. 139. Company E: Dysentery, August 16; still sick August 31. This man is recorded as having been in hospital with malaria June 24 to July 7.
No. 140. Company A: Intermittent malaria, August 16; still sick August 31.
No. 141. Company A: Continued malaria, August 16; still sick August 31.
No. 142. Company H: Remittent malaria, August 16; still sick August 31.
No. 143. Company D: without date or diagnosis; sent to division hospital August 16. Here the disease was diagnosed continued malaria, and the patient was furloughed August 22.
No. 144. Company F: Without date or diagnosis; sent to division hospital August 16. Here the disease was diagnosed continued malaria, and the patient remained sick August 31.
No. 145. Company E: Dysentery, August 16; still sick August 31.
No. 146. Company L: Remittent malaria, August 16; still sick August 31.
No. 147. Company C: Dysentery, August 16; still sick August 31.
No. 148. Company H: Without date or diagnosis; sent to division hospital August 16. Here the disease was diagnosed dysentery, and the patient was furloughed August 27.
No. 149. Company E: Without date or diagnosis; sent to Sternberg Hospital August 16. Here the disease was diagnosed typhoid fever, and the patient died August 30.
No. 150. Company B: Remittent malaria, August 18; still sick in hospital August 31.
No. 151. Company H: Without date or diagnosis; sent to division hospital August 18. Here the disease was diagnosed remittent malaria, and the patient was furloughed August 27.
No. 152. Company K: Without date or diagnosis; sent to division hospital August 18. Here the disease was diagnosed continued fever, and the patient died September 19.
No. 153. Company K: Without date or diagnosis; sent to division hospital August 18. Here the disease was diagnosed continued fever, and the patient remained sick August 31.
No. 154. Company D: Without date or diagnosis; sent to division hospital August 19. Here the diagnosis is recorded as undetermined fever, and the patient was furloughed August 30.
No. 155. Company F: Continued fever, August 19; furloughed August 27.
No. 156. Company D: Continued malaria, August 19; furloughed August 26.
No. 157. Company C: Diarrhea, August 19; furloughed August 23.
No. 158. Company C: Intermittent malaria, August 19; furloughed August 21.
No. 159. Company F: Continued malaria, August 19; sent to Sternberg Hospital August 31. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 9.
No. 160. Company A: Diarrhea, August 19; furloughed August 23.
No. 161. Company B: Dysentery, August 19; still sick in hospital August 31.
No. 162. Company B: Intermittent malaria, August 19; sent to Leiter Hospital September 3. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 15.

No. 163. Company A: Dysentery, August 20; still sick August 31.
No. 164. Company H: Diarrhea, August 20; still sick August 31.
No. 165. Company E: Intermittent malaria, August 20; furloughed August 27.
No. 166. Company E: Without date or diagnosis; sent to division hospital August 20. Here the disease was diagnosed continued fever, and the patient was furloughed August 27.
No. 167. Company C: Remittent malaria, August 21; still sick August 31.
No. 168. Company F: Intermittent malaria, August 21; still sick August 31.
No. 169. Company I: Continued malaria, August 22; still sick September 30.
No. 170. Company K: Without date or diagnosis; sent to Leiter Hospital August 23. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 13.
No. 171. Company E: Intermittent malaria, August 23; sent to division hospital August 23. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 7.
No. 172. Company H: Without date or diagnosis; sent to Leiter Hospital August 23. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 14.
No. 173. Company B: Intermittent malaria, August 24; still sick September 30.
No. 174. Company I: Dysentery, August 25; still sick September 30.
No. 175. Company G: Fever, August 25; still sick September 30.
No. 176. Company C: Jaundice, August 25; sent to Sternberg Hospital September 3. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 4.
No. 177. Company E: Jaundice, August 25; sent to division hospital August 28. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 1.
No. 178. Company I: Without date or diagnosis; sent to division hospital August 26, and transferred to Sternberg Hospital August 30. Here the disease was diagnosed typhoid fever. Further disposition of this patient is not given.
No. 179. Company B: Without date or diagnosis; sent to division hospital August 26. Here a diagnosis of undetermined fever was recorded, and the patient was furloughed September 1.
No. 180. Company E: Intermittent malaria, August 26; still sick September 30.
No. 181. Company E: Without date or diagnosis; sent to division hospital August 26. Here a diagnosis of undetermined fever was recorded, and the patient was furloughed September 1.
No. 182. Company C: Intermittent malaria, August 27; sent to division hospital August 28. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 28.
No. 183. Company L: Remittent malaria, August 27; sent to division hospital August 27. Here the diagnosis was changed to continued fever, and the patient remained sick in hospital September 30.
No. 184. Company M: Intermittent malaria, August 27; sent to Sternberg Hospital September 3. Here the diagnosis was changed to typhoid fever, and the patient was furloughed October 7.
No. 185. Company M: Jaundice, August 27; sent to Sternberg Hospital without date. Here the diagnosis was changed to typhoid fever. The further disposition of this patient is not given.
No. 186. Company L: Intermittent malaria, August 28; sent to Sternberg Hospital September 4. Here the diagnosis was changed to continued malaria, and the patient was furloughed September 8.
No. 187. Company E: Intermittent malaria, August 28; sent to Sternberg Hospital September 3. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 10.
No. 188. Company D: Without date or diagnosis; sent to division hospital August 28, and transferred to Leiter Hospital September 3. Here the disease was diagnosed intermittent malaria, and the patient was furloughed September 8.
No. 189. Company H: Continued fever, August 28; sent to divi-

sion hospital August 28. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 7.

No. 190. Company D: Remittent malaria, August 28; still sick September 30.

No. 191. Company I: Intermittent malaria, August 29; sent to Sternberg Hospital September 3. Here the diagnosis was changed to typhoid fever, and the patient was furloughed October 8.

No. 192. Company K: Intermittent malaria, August 29; still sick September 30.

No. 193. Company I: Intermittent malaria, August 29; sent to Sternberg Hospital September 3. Here the diagnosis was changed to remittent malaria, and the patient was furloughed September 26.

No. 194. Company F: Intermittent malaria, August 29; sent to division hospital August 30. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 28.

No. 195. Company F: Intermittent malaria, August 29; still sick in division hospital September 30.

No. 196. Company B: Without date or diagnosis; sent to division hospital August 30. Here the disease was diagnosed remittent malaria, and the patient remained sick in hospital September 30.

No. 197. Company L: Without date or diagnosis; sent to division hospital August 30, and transferred to Leiter Hospital September 3. Here the disease was diagnosed remittent malaria, and the patient was furloughed October 14.

No. 198. Company D: Without date or diagnosis; sent to Sternberg Hospital August 31. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 16.

No. 199. Company B: Without date or diagnosis; sent to division hospital August 31, and transferred to Leiter Hospital September 3. Here the disease was diagnosed typhoid fever. The further disposition of this patient is not given.

No. 200. Company M: Intermittent malaria, August 31; sent to Sternberg Hospital September 3. Here the diagnosis was changed to continued malaria, and the patient was furloughed September 16.

No. 201. Company M: Without date or diagnosis; sent to Sternberg Hospital August 31. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 17.

No. 202. Company F: Without date or diagnosis; sent to Sternberg Hospital August 31. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 3.

No. 203. Company H: Jaundice, August 31; sent to Sternberg Hospital September 1. Here the diagnosis was changed to continued malaria, and the patient was furloughed September 10.

No. 204. Company L: Without date or diagnosis; sent to division hospital September 1. Here the diagnosis is recorded as undetermined fever, and the patient remained sick in hospital September 30.

No. 205. Company B: Intermittent malaria, September 1; still sick September 30.

No. 206. Company G: Without date or diagnosis; sent to division hospital September 2. The disease was here diagnosed remittent malaria, and the patient was transferred to Leiter Hospital September 3. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 8.

No. 207. Company K: Without date or diagnosis; sent to Sternberg Hospital September 3. Here the disease was diagnosed typhoid fever, and the patient died September 16.

No. 208. Company G: Without date or diagnosis; sent to Sternberg Hospital September 3. Here the disease was diagnosed remittent malaria, and the patient was furloughed September 9.

No. 209. Company K: Without date or diagnosis; sent to Sternberg Hospital September 3. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 8.

No. 210. Company I: Intermittent malaria, September 3; sent to Sternberg Hospital September 4. Here the diagnosis is recorded as malaria, and the patient was furloughed September 10.

No. 211. Company E: Without date or diagnosis; sent to Sternberg Hospital September 3. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 7.

No. 212. Company E: Intermittent malaria, September 3; sent to Sternberg Hospital September 4. Here the diagnosis was changed to typhoid fever, and the patient was furloughed September 7.

No. 213. Company F: Without date or diagnosis; sent to Leiter Hospital September 3. Here the disease was diagnosed remittent malaria, and the patient was furloughed September 23.

No. 214. Company M: Intermittent malaria, September 3; still sick September 30.

No. 215. Company L: Intermittent malaria, September 4; still sick September 30.

No. 216. Company D: Intermittent malaria, September 5; still sick September 30.

No. 217. Company D: Without date or diagnosis; sent to Sternberg Hospital September 5. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 20.

No. 218. Company I: Without date or diagnosis; sent to Sternberg Hospital September 5. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 8.

No. 219. Company K: Intermittent malaria; September 6; sent to Sternberg Hospital September 7. Here the diagnosis was changed to typhoid fever, and the patient was furloughed October 3.

No. 220. Company K: Intermittent malaria, September 6; sent to Sternberg Hospital without date. Here the diagnosis was changed to typhoid fever. The further disposition of this patient is not given.

No. 221. Company E: Typhoid fever September 7; died September 19.

No. 222. Company B: Without date or diagnosis; sent to Sternberg Hospital September 7. Here the disease was diagnosed continued malaria, and the patient was furloughed September 26.

No. 223. Company M: Typhoid fever, September 7; furloughed October 10.

No. 224. Company L: Without date or diagnosis; sent to Sternberg Hospital September 9. Here the diagnosis was changed to typhoid fever, and the patient was furloughed November 5.

No. 225. Company M: Typhoid fever, September 11; sent to Sternberg Hospital without date. This name does not occur on the records of Sternberg Hospital.

No. 226. Company K: Typhoid fever, September 12; disposition not given.

No. 227. Company K: Typhoid fever, September 15; disposition not given.

No. 228. Company M: Without date or diagnosis; sent to Sternberg Hospital October 22. Here the disease was diagnosed typhoid fever, and the patient was furloughed October 28. It must be understood that October 22 is not the initial date of this case. On the records of Sternberg Hospital it appears that this patient was transferred to this hospital from Leiter Hospital, but the name can not be found on the records of Leiter Hospital.

SUMMARY.

Assembled near Little Rock, Ark., during April and May, 1898.

Mustered into United States service May 19, 1898.

Arrived at Chickamauga Park, Ga., May 27, 1898.

Strength on arrival, 1,190.

Date of first case of probable typhoid fever, June 2, 1898.

Date of first case of recognized typhoid fever, June 3, 1898.

Left Chickamauga Park, Ga., September 8, 1898.

Strength on departure, 1,290.

Number of cases of probable typhoid fever developed at Chickamauga	224
Number of cases of probable typhoid fever developed after leaving Chickamauga	4

Total number of cases of probable typhoid fever developed in the First Arkansas Volunteer Infantry from May to September, 1898. 228

These 228 cases were diagnosed as follows:

Typhoid fever.....	83
Malaria.....	92
Continued fever.....	18
Dysentery.....	19
Diarrhea.....	9
Undetermined fever.....	6
Undiagnosed.....	1
Total.....	228

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
1898.				
Allison, A. W.....	Pvt., A.	Aug. 29	Moulton, Tex.....	Typhoid.
Anderson, T. H.....	Pvt., K.	July 9	Leiter Hospital, Ga.....	Do.
Bailey, S. M.....	Pvt., L.	Aug. 7	Chickamauga, Ga.....	Do.
Beard, B. H.....	Pvt., M.	Aug. 28	Do.....	Do.
Burbanks, Carlisle.....	Pvt., G.	July 21	Camp Thomas, Ga.....	Heart failure with typhoid.
Denson, M. J.....	Pvt., A.	Sept. 3	Leiter General Hospital, Ga.....	Typhoid.
Dickerson, J. L.....	Pvt., K.	Sept. 16	Do.....	Tobacco-narcotism.
Foster, Frank R.....	Pvt., C.	Oct. 8	Fort Logan, Ark.....	Typhoid.
Fox, Henry.....	Pvt., L.	Sept. 5	Texarkana, Tex.....	(Typhoid); continued fever.
Gateley, Henry.....	Pvt., C.	Aug. 8	Second Division hospital, Third Army Corps.	
Hall, Thomas M.....	Corpl., H.	Sept. 6	Arkadelphia, Ark.....	Typhoid while on sick furlough.
Lockie, A.....	Pvt., K.	Aug. 27	Do.....	Typhoid.
Mayo, C. H.....	Pvt., I.	July 15	Camp Thomas, Ga.....	Do.
Niger, John.....	Pvt., D.	July 21	Do.....	Do.
Quielt, R. C.....	Pvt., E.	Sept. 18	Fort Logan, Ark.....	Do.
Reynolds, J. M.....	Pvt., C.	Aug. 22	Camp Thomas, Ga.....	(Typhoid); spinal meningitis.
Simpson, W. C.....	Pvt., E.	Aug. 30	Do.....	Typhoid.
Sims, John W.....	Pvt., E.	July 16	Do.....	Pneumonia and measles.
Strinklind, J. L.....	Sgt., F.	Oct. 4	Fayetteville, Ark.....	Typhoid.
Tisdale, F. S.....	Pvt., I.	Dec. 22	Camp Shipp, Ala.....	Croupous pneumonia.
Vollman, Ivan D.....	Corpl., B.	Sept. 9	Chickamauga, Ga.....	Typhoid.
White, W. M.....	Pvt., C.	June 23	Do.....	Cerebro-spinal meningitis.
Whiteside, W. C.....	Pvt., E.	Sept. 8	Ozan, Ark.....	Typhoid.
Total deaths.....				23
Deaths due to typhoid fever.....				19

Percentage of deaths among probable cases of typhoid fever (228), 8.33.

Percentage of deaths among recognized cases of typhoid fever (83), 22.89.

COMMUNICATIONS FROM THE SURGEONS OF THE FIRST ARKANSAS VOLUNTEER INFANTRY.

Medical officers.

James C. Minor, major and surgeon, Hot Springs, Ark.
Eugene C. Hay, lieutenant and assistant surgeon, Hot Springs, Ark.
Clint P. Merriwether, lieutenant and assistant surgeon, Walnut Ridge, Ark.

Major Minor states:

The camp at Little Rock was on high, rolling ground with porous soil. The water supply was obtained from the city pipes, which had been carried through the encampment. There were no cases of typhoid fever in the neighborhood of the camp and none among the troops during their stay at this place.

The location of the camp in Chickamauga Park was unfortunate, being too close to other regiments and shaded too densely. The water supply was at all times bountiful, but doubtful as to quality, being hauled from springs in barrels not properly cared for.

Major Minor thinks that we have greatly exaggerated the number of cases of probable typhoid fever in his regiment.

FIFTH MISSOURI VOLUNTEER INFANTRY.

Second Brigade, Second Division, Third Army Corps.

The first report from this regiment covers the period from May 18 to May 31, inclusive. The regiment was under the care of Major Howelson, who makes the following statement:

The regiment left Jefferson Barracks May 25 for Chickamauga Park, Ga., arriving at the latter place May 27. The sanitary conditions at Chickamauga are good. Pneumonia, malaria, mumps, and acute diarrhea have been the prevailing diseases.

CONDENSED SICK REPORT FROM MAY 18 TO MAY 31.

Mean strength.....	1,024
Acute diarrhea.....	10
Intermittent malaria.....	2
Other diseases.....	15
Total.....	27

In the June report Major Howelson states that malaria, indigestion, and acute diarrhea were the prevailing diseases.

CONDENSED SICK REPORT FOR JUNE.

Mean strength.....	1,053
Diarrhea.....	111
Enterocolitis.....	1
Intermittent malaria.....	60
Indigestion.....	1
Malaria.....	1
Other diseases.....	67
Total.....	241

In the July report Major Howelson states:

The prevailing diseases were intermittent malarial fever, typhoid fever, and diarrhea. Water from surface wells seems to be the exciting cause of the prevailing diseases, together with peculiar formation of the ground (hardpan) in this location, which retains the sewage. The sinks become putrefied and breed disease.

CONDENSED SICK REPORT FOR JULY.

Mean strength.....	1,313
Diarrhea.....	41
Intermittent malaria.....	79
Remittent malaria.....	10
Dysentery.....	1
Typhoid fever.....	6
Other diseases.....	54
Total.....	191

In the August report Major Howelson states that the regiment left Chickamauga Park for Lexington, Ky., August 27.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength.....	1,299
Typhoid fever.....	10
Intermittent malaria.....	285
Remittent malaria.....	2
Diarrhea.....	50
Indigestion.....	2
Other diseases.....	75
Total.....	424

The September report is signed by First Asst. Surg. F. M. McCallum, who makes the following statement:

The prevailing diseases were malaria and typhoid fever. The usual means for preventing such diseases were adopted. The regiment remained at Camp Hamilton, Ky., from September 1 to September 6. It was in transit from Camp Hamilton, Ky., to Kansas City, Mo., from September 6 to September 16.

The regiment was furloughed September 16 for thirty days, a detail of 150 men being left in camp to guard property. All the sick were sent to the various hospitals in Kansas City and were under the care of Contract Surgeon Coffin.

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength.....	1,207
Intermittent malaria.....	28
Diarrhea.....	6
Typhoid fever.....	22
Gastritis.....	2
Dysentery.....	1
Other diseases.....	22
Total.....	81

The October report is also signed by Surgeon McCallum, who makes the following statement:

The prevailing diseases were typhoid fever with a few cases of malarial fever, most of the typhoid cases developing since returning from Chickamauga Park, Ga. But few cases were treated in quarters, most all cases being sent to the various hospitals in Kansas City, Mo., and treated by S. Coffin, contract surgeon. On the 19th day of September the regiment was moved into an old building in Kansas City, Mo., on account of the stormy weather; distance traveled, 8 miles.

In explanation of the statement made in the above quotation, it should be stated that when the regiment returned from Lexington, Ky., the detail left after furlough was in camp at Camp Sanger and Camp Compton, near Kansas City, Mo.

CONDENSED SICK REPORT FOR OCTOBER.

Mean strength.....	1,298
Malaria.....	2
Intermittent malaria.....	13
Typhoid fever.....	22
Gastro-enteritis.....	3
Diarrhea.....	2
Gastritis.....	2
Dysentery.....	1
Other diseases.....	55
Total.....	100

The following is a list of the recognized and probable cases of typhoid fever in this regiment:

- No. 1. Company C: Diarrhea, June 6; sent to division hospital June 17. There is no further record of this case.
- No. 2. Company L: Diarrhea, June 8; still sick June 30.
- No. 3. Company E: Diarrhea, June 8 to 19.
- No. 4. Company H: Diarrhea, June 10; furloughed from division hospital July 1.
- No. 5. Company K: Intermittent malaria, June 10; furloughed June 22.
- No. 6. Company H: Diarrhea, June 11; furloughed July 1.
- No. 7. Company L: Diarrhea, June 11 to 23.
- No. 8. Company E: Intermittent malaria, June 18 to July 17.
- No. 9. Hospital corps: Intermittent malaria, June 21; still sick in Leiter Hospital July 31.
- No. 10. Company K: Intermittent malaria, June 26 to July 10.
- No. 11. Company M: Debility and diarrhea, June 26; still sick at Fort McPherson July 31.
- No. 12. Company K: Diarrhea, June 27 to July 7.
- No. 13. Company E: Diarrhea, June 29 to July 13.
- No. 14. Company B: Typhoid fever, July 2; furloughed July 15.
- No. 15. Company D: Dysentery, July 2; furloughed July 26.
- No. 16. Company A: Diarrhea, July 2 to 28.
- No. 17. Company C: Intermittent malaria, July 6 to 29.
- No. 18. Company I: Intermittent malaria, July 8; furloughed August 14.
- No. 19. Company E: Intermittent malaria, July 9 to 30.
- No. 20. Company G: Typhoid fever, July 9; sent to Fort McPherson July 25.
- No. 21. Company M: Diarrhea, July 10 to 31.
- No. 22. Company C: Typhoid fever, July 11; died in hospital July 29.
- No. 23. Company A: Typhoid fever, July 11; died in division hospital July 20.
- No. 24. Company E: Remittent malaria, July 12; furloughed from division hospital August 20.
- No. 25. Company C: Remittent malaria, July 12; furloughed from division hospital July 25.
- No. 26. Company I: Intermittent malaria, July 14; furloughed from division hospital August 1.
- No. 27. Company L: Intermittent malaria, July 16; furloughed from division hospital August 26.
- No. 28. Company I: Typhoid fever, July 21; furloughed from Leiter Hospital September 11.
- No. 29. Company B: Intermittent malaria, July 22; furloughed from division hospital August 20.
- No. 30. Company H: Intermittent malaria, July 22 to August 15.
- No. 31. Company B: Typhoid fever, July 24; furloughed from division hospital August 30.
- No. 32. Company C: Intermittent malaria, July 24 to August 11.
- No. 33. Company A: Typhoid fever, July 25; still sick in division hospital August 31.
- No. 34. Company C: Intermittent malaria, July 26 to September 3.
- No. 35. Company E: Intermittent malaria, July 27; furloughed August 6.
- No. 36. Company H: Intermittent malaria, July 27; furloughed August 15.
- No. 37. Company H: Intermittent malaria, July 27; furloughed August 5.
- No. 38. Company G: Intermittent malaria, July 29; furloughed August 23.
- No. 39. Company B: Diarrhea, July 30; furloughed August 27.
- No. 40. Company M: Diarrhea, July 30; furloughed August 10.
- No. 41. Company M: Intermittent malaria, August 1; still sick September 30.
- No. 42. Company A: Intermittent malaria, August 1; still sick September 30.

No. 43. Company D: Intermittent malaria, August 2 to September 26.
 No. 44. Company I: Intermittent malaria, August 3; still sick September 30.
 No. 45. Company E: Intermittent malaria, August 3 to 26.
 No. 46. Company E: Intermittent malaria, August 3; still sick September 30.
 No. 47. Company C: Intermittent malaria, August 4 to 24.
 No. 48. Company C: Intermittent malaria, August 6; still sick September 30.
 No. 49. Company C: Intermittent malaria, August 6; furloughed from division hospital August 23. In the hospital this case was diagnosed typhoid fever.
 No. 50. Company A: Intermittent malaria, August 7; still sick September 30.
 No. 51. Company F: Intermittent malaria, August 8; furloughed from division hospital September 16.
 No. 52. Company I: Intermittent malaria, August 8; furloughed from division hospital August 26.
 No. 53. Company I: Intermittent malaria, August 8; still sick September 30.
 No. 54. Company C: Intermittent malaria, August 9; furloughed August 24.
 No. 55. Company L: Intermittent malaria, August 9; died August 21.
 No. 56. Company F: Intermittent malaria, August 9; furloughed August 26.
 No. 57. Company K: Malaria, August 9; died August 9.
 No. 58. Company B: Intermittent malaria, August 9; furloughed September 16.
 No. 59. Company H: Intermittent malaria, August 9; furloughed August 26.

SUMMARY.

Assembled at Jefferson Barracks, near St. Louis, Mo., during April and May, 1898.

Mustered into United States service May 18, 1898.

Arrived at Chickamauga Park, Ga., May 27, 1898.

Strength on arrival, 1,024.

Date of first case of probable typhoid fever, June 6, 1898.

Date of first case of recognized typhoid fever, July 2, 1898.

Left Chickamauga Park, Ga., August 27, 1898.

Strength on departure, 1,274.

Number of cases of probable typhoid fever developed at Chickamauga 153

Arrived at Lexington, Ky., August 28, 1898.

Left Lexington, Ky., September 6, 1898.

Went from Lexington, Ky., to Kansas City, Mo.

Furloughed September 16, 1898.

Number of cases of probable typhoid fever developed after leaving Chickamauga 59

Total number of cases of probable typhoid fever developed in the Fifth Missouri Volunteer Infantry from May to October, 1898 212

These 212 cases were diagnosed as follows:

Typhoid fever.....	51
Malaria.....	133
Diarrhea.....	21
Debility.....	1
Dysentery.....	2
Gastro-duodenitis.....	3
Gastro-enteritis.....	1
Total.....	212

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Belk, Fred B.....	Pvt., L	1898 Aug. 21	Camp Thomas, Ga.....	Typhoid.
Carse, Thomas R.....	Qmsgt., K	Sept. 26	Wellington, Mo.....	Do.
Clements, Charles B.....	Pvt., E	June 21	Chickamauga, Ga.....	Spinal meningitis.
Craig, Fred L.....	Pvt., C	July 29	Camp Thomas, Ga.....	Typhoid.
Doonan, Claude.....	Pvt., A	July 20	Chickamauga, Ga.....	Do.
Eaton, Clarence A.....	Pvt., K	Aug. 9	do.....	Do.
Elling, Martin E.....	Corpl., K	Aug. 22	Chattanooga, Tenn.....	Do.
Heimsath, Henry J.....	Pvt., A	Sept. 30	Kansas City, Mo.....	Do.
Holbs, Emery G.....	Pvt., F	June —	St. Louis, Mo.....	Do.
McCarthy, John C.....	Pvt., C	Sept. 11	Kansas City, Mo.....	Do.
McElwee, John.....	Pvt., M	Aug. 20	Excelsior Springs, Mo.	Abcess of brain.
Mason, Richard W.....	Pvt., L	May 30	St. Louis, Mo.....	(Typhoid); intermittent malarial fever tertian.
Ray, Leopold.....	Pvt., M	July 28	do.....	Typhoid.
Scott, Harley W.....	Pvt., E	Sept. 15	Pleasant Hill, Mo.....	Do.
Sexaner, Fred.....	Pvt., K	Sept. 20	Hermion, Mo.....	Do.
Tumbleson, James O.....	Corpl., E	Aug. 17	Chickamauga, Ga.....	Do.

Total deaths..... 16
Deaths due to typhoid fever 14

Percentage of deaths among probable cases (212) of typhoid fever, 6.60.
Percentage of deaths among recognized cases of typhoid fever (51), 27.45.

SECOND ARKANSAS VOLUNTEER INFANTRY.

Second Brigade, Second Division, Third Army Corps.

In the May report Major Orto makes the following statement:

There are no data from which to compile a report prior to June 1. The regiment was mustered into service May 27, 1898, at Camp Dodge, Little Rock, Ark. It was en route from Camp Dodge to Chickamauga Park May 29 and 30. The camp at Little Rock, Ark., where the regiment was mustered into service, was in part in charge of Doctor Cantrell. The present major surgeon was not at any time in charge, he having been kept on duty at the State hos-

pital examining recruits until orders for transfer to Chickamauga Park were received. From the time of muster in until the time of arrival here at the end of the month there were no cases of a serious nature and no duty which required anyone to be excused.

The mean strength is given at 1,029.

In the June report Major Orto makes the following statement:

Cases constituting the sickness in the Second Arkansas Volunteer Infantry are as follows:

	Per cent.
Vaccinia	46.89
Malaria	11.04
Diarrhea	11.02
All other cases	31.05

The regiment was vaccinated about ten days before it left Camp Dodge for this place. En route the men ate dainties and drank freely of beer and whisky given to them by their friends. Their arms sustained many injuries from their own good-natured pushing and unnecessary crowding. Their arms were treated as nearly antiseptically as circumstances and condition of medical supplies would admit.

The presence of malarial fever is due to former residence in malarial districts, manifesting itself on moving to higher altitude and change of air and water. The presence of diarrhea is due to the ignorance of raw soldiers in preparing food and lack of knowledge of personal care. They have been given instructions in such matters during the month. The changes made by gains and losses are as follows:

Gained:

June 19, enlisted men	41
June 18, chaplain	1
June 24, enlisted men	29
June 28, enlisted men	83
June 30, enlisted men	41
Total	195

Lost:

June 30, died	1
June 10, discharged	1
June 30, transferred to division hospital	30
Total	32

CONDENSED SICK REPORT FOR JUNE.

Mean strength	1,009
Intermittent malaria	35
Remittent malaria	76
Acute diarrhea	103
Dysentery	10
Typhoid fever	3
Pernicious malaria	1
Other diseases	494
Total	722

In the July report Major Orto states:

The prevailing diseases are measles, typhoid fever, malarial fever, diarrhea, and mild bronchitis. The cases of measles have been isolated. The malarial and typhoid fevers are due to local causes not easily removed. I would recommend that water be boiled and filtered before drinking, but at present we have no containers, neither barrels nor buckets to cool the water, nor have we kettles to boil it in.

The Third Battalion, composed of Companies I, K, L, and M, was detached on July 20 and returned on July 27. This regiment was on target practice, in charge of Lieut. H. Willis. His report is transmitted separately.

CONDENSED SICK REPORT FOR JULY.

Mean strength	1,323
Intermittent malaria	296
Remittent malaria	79
Acute diarrhea	187
Dysentery	17
Typhoid fever	9
Other diseases	127
Total	715

Condensed sick report of the Third Battalion of the Second Arkansas Volunteer Infantry at Target Camp, Chickamauga Park, Ga., for the month of July, 1898.

Strength of this command is not given.

Intermittent malaria	10
Remittent malaria	2
Acute diarrhea	10
Dysentery	1
Typhoid fever	9
Other diseases	23
Total	55

In the August report Lieut. H. Willis, in charge of the regiment, makes the following statement:

The prevailing diseases for the month were malaria, measles, acute diarrhea, typhoid fever, and hepatic torpor. Measles were invariably isolated from camp, but the battalion left for target practice were rained upon and exposed, and measles appeared. Water is now boiled in this regiment.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength	1,335
Intermittent malaria	240
Remittent malaria	111
Acute diarrhea	154
Dysentery	18
Typhoid fever	15
Other diseases	60
Total	598

This regiment remained at Chickamauga Park, Ga., until September 9, when it left for Anniston, Ala.

The September report is signed by Lieutenant Willis without comment.

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength	1,282
Intermittent malaria	109
Remittent malaria	167
Acute diarrhea	79
Dysentery	9
Typhoid fever	8
Other diseases	135
Total	507

The October report is signed by Lieutenant King, who makes the following statement:

The health of the regiment has been rapidly improving since the date of its arrival at Camp Shipp. The prevailing diseases have been jaundice and malarial fever, remittent and intermittent. The cause of the jaundice was due chiefly to the fact that the company tents were pitched with no means of heating. Those officers

and enlisted men who occupied heated tents have entirely escaped this complaint. Only two cases of typhoid fever have developed since the encampment of this regiment at Anniston, the infection of which was no doubt received from some source other than our water supply. I believe that the typhoid fever of Camp Shipp can be traced to one very old spring near the city of Anniston. The regimental hospital of this regiment has been almost fully equipped.

CONDENSED SICK REPORT FOR OCTOBER.

Mean strength	1,251
Intermittent malaria	26
Remittent malaria	149
Acute diarrhea	38
Dysentery	3
Typhoid fever	3
Total	219

The following is a list of the recognized and probable cases of typhoid fever in this regiment:

- No. 1. Company D: Intermittent malaria, June 4 to 18.
- No. 2. Company L: Intermittent malaria, June 8; still sick in Leiter Hospital July 31.
- No. 3. Company F: Malaria, June 11; still sick in division hospital July 31.
- No. 4. Company E: Remittent malaria, June 11; furloughed from Leiter Hospital July 11.
- No. 5. Company B: Remittent malaria, June 12; still sick July 31.
- No. 6. Company L: Dysentery, June 12 to August 20.
- No. 7. Company B: Remittent malaria, June 15 to July 25.
- No. 8. Company E: Malaria, June 15; still sick in division hospital July 31. In hospital this case was diagnosed typhoid fever.
- No. 9. Company E: Intermittent malaria, June 15; furloughed from division hospital August 1.
- No. 10. Company I: Remittent malaria, June 16 to 28.
- No. 11. Company C: Remittent malaria, June 17; died in division hospital June 30.
- No. 12. Company G: Diarrhea, June 18 to July 20.
- No. 13. Company G: Dysentery, June 18 to July 27.
- No. 14. Company E: Diarrhea, June 18 to July 7.
- No. 15. Company F: Typhoid fever, June 20; died in division hospital July 22.
- No. 16. Company F: Remittent malaria, June 20; furloughed from Sternberg Hospital September 23. In hospital this case was diagnosed typhoid fever.
- No. 17. Company B: Remittent malaria, June 20; furloughed June 30.
- No. 18. Company D: Remittent malaria, June 20 to July 9.
- No. 19. Company L: Remittent malaria, June 21; furloughed from Leiter Hospital July 27.
- No. 20. Company G: Remittent malaria, June 21; still sick in division hospital July 31.
- No. 21. Company H: Intermittent malaria, June 22 to July 5.
- No. 22. Company B: Diarrhea, June 23; still sick July 31.
- No. 23. Company E: Without date or diagnosis; sent to Leiter Hospital June 23. Here the disease was diagnosed typhoid fever, and the patient was furloughed July 21.
- No. 24. Company E: Remittent malaria, June 24; still sick in division hospital July 31.
- No. 25. Company E: Remittent malaria, June 24; still sick in division hospital July 31.
- No. 26. Company H: Remittent malaria, June 24; still sick in division hospital July 31.
- No. 27. Company D: Remittent malaria, June 24; still sick in division hospital July 31.
- No. 28. Company E: Typhoid fever, June 25; furloughed from Leiter Hospital August 13.

- No. 29. Company E: Diarrhea, June 25; still sick in Leiter Hospital July 31.
- No. 30. Company B: Remittent malaria, June 27 to July 7.
- No. 31. Company K: Remittent malaria, June 28; still sick in division hospital July 31.
- No. 32. Company B: Remittent malaria, June 28 to July 19.
- No. 33. Company B: Remittent malaria, June 29 to July 11.
- No. 34. Company M: Remittent malaria, June 29 to July 25.
- No. 35. Company G: Malaria, June 30 to July 14.
- No. 36. Company H: Malaria, July 1 to 28.
- No. 37. Company L: Diarrhea, July 1 to 12.
- No. 38. Company H: Remittent malaria, July 5 to 26.
- No. 39. Company K: Remittent malaria, July 5; still sick in division hospital July 31.
- No. 40. Company K: Remittent malaria, July 5 to 22.
- No. 41. Company E: Remittent malaria, July 5; still sick in division hospital July 31.
- No. 42. Company B: Diarrhea, July 5 to 16.
- No. 43. Company C: Diarrhea, July 6 to August 6.
- No. 44. Company E: Diarrhea, July 7 to August 22.
- No. 45. Company I: Malaria, July 7 to 17.
- No. 46. Company B: Remittent malaria, July 8 to August 3.
- No. 47. Company C: Malaria, July 10; still sick August 31.
- No. 48. Company C: Malaria, July 10 to August 3.
- No. 49. Company E: Undetermined fever, July 11; still sick in Leiter Hospital July 31. In hospital this case was diagnosed typhoid fever.
- No. 50. Company L: Remittent malaria, July 12 to August 25.
- No. 51. Company C: Remittent malaria, July 13 to August 16.
- No. 52. Company I: Remittent malaria, July 15 to August 24.
- No. 53. Company G: Typhoid fever, July 16; sent to Fort McPherson July 25.
- No. 54. Company I: Remittent malaria, July 17; died in division hospital August 19. In hospital this case was diagnosed typhoid fever.
- No. 55. Company K: Hepatic engorgement, July 18 to August 12.
- No. 56. Company G: Diarrhea, July 18 to August 4.
- No. 57. Company M: Remittent malaria, July 19 to August 1. This man is recorded as having had malaria, July 3 to 5.
- No. 58. Company K: Remittent malaria, July 19 to August 3.

- No. 62. Company G: Remittent malaria, July 20 to August 6.
- No. 63. Company not given: Diarrhea, July 20; still sick in division hospital August 31.
- No. 64. Company B: Intermittent malaria, July 21 to August 24.
- No. 65. Company D: Diarrhea, July 21 to August 3.
- No. 66. Company E: Intermittent malaria, July 21 to August 9.
- No. 67. Company I: Intermittent malaria, July 21 to August 21.
- No. 68. Company D: Intermittent malaria, July 21 to August 24.
- No. 69. Company K: Typhoid fever, July 22 to August 24.
- No. 70. Company H: Intermittent malaria, July 23 to August 4.
- No. 71. Company K: Remittent malaria, July 23 to August 28.
- No. 72. Company G: Intermittent malaria, July 23 to August 4.
- No. 73. Company I: Remittent malaria, July 23 to August 24.
- No. 74. Company D: Typhoid fever, July 23; died in Leiter Hospital July 31.
- No. 75. Company I: Remittent malaria, July 23 to August 28.
- No. 76. Company I: Remittent malaria, July 23; still sick in division hospital August 31.
- No. 77. Company D: Typhoid fever, July 24; disposition not given.
- No. 78. Company B: Remittent malaria, July 25; still sick August 31.
- No. 79. Company F: Remittent malaria, July 25 to August 24.
- No. 80. Company C: Typhoid fever, July 25; sent to Fort McPherson July 25.

- No. 81. Company K: Intermittent malaria, July 25 to August 24.
No. 82. Company C: Remittent malaria, July 25 to August 6.
No. 83. Company G: Typhoid fever, July 25; sent to Fort McPherson July 25.
No. 84. Company I: Intermittent malaria, July 26; still sick in division hospital August 31.
No. 85. Company F: Intermittent malaria, July 27 to August 24.
No. 86. Company D: Typhoid fever, July 28; disposition not given.
No. 87. Company I: Intermittent malaria, July 28; furloughed August 9.
No. 88. Company B: Typhoid fever, July 28; disposition not given.
No. 89. Company E: Typhoid fever, July 28; furloughed from Sternberg Hospital August 26.
No. 90. Company H: Remittent malaria, July 28; still sick in division hospital August 31.
No. 91. Company B: Intermittent malaria, July 26; still sick in division hospital August 31.
No. 92. Company D: Typhoid fever, July 28; still sick August 31.
No. 93. Company G: Intermittent malaria, July 28; still sick in Sternberg Hospital August 31. In hospital this case was diagnosed typhoid fever.
No. 94. Company L: Intermittent malaria, July 28 to August 28. This man is recorded as having had malaria from July 1 to 19.
No. 95. Company C: Typhoid fever, July 29; still sick in division hospital August 31.
No. 96. Company C: Remittent malaria, July 29; still sick in division hospital August 31.
No. 97. Company M: Typhoid fever, July 29; still sick August 31.
No. 98. Company L: Remittent malaria, July 29 to August 23.
No. 99. Company L: Diarrhea, July 30 to August 25.
No. 100. Company B: Diarrhea, July 30; died in division hospital August 17. In hospital this case was diagnosed typhoid fever.
No. 101. Company G: Undetermined fever, July 30 to August 24.
No. 102. Company K: Intermittent malaria, July 30 to August 14.
No. 103. Company E: Typhoid fever, July 30; furloughed from Leiter Hospital October 4.
No. 104. Company K: Intermittent malaria, July 31 to August 18.
No. 105. Company G: Diarrhea, July 31 to August 14.
No. 106. Company not given: Hepatic torpor, July 31 to August 14.
No. 107. Company I: Intermittent malaria, August 1 to 22.
No. 108. Company A: Typhoid fever, August 2; disposition not given.
No. 109. Company M: Typhoid fever, August 3; still sick in division hospital August 31.
No. 110. Company K: Intermittent malaria, August 3; furloughed from Sternberg Hospital September 10. In hospital this case was diagnosed typhoid fever.
No. 111. Company M: Without date or diagnosis; sent to Sternberg Hospital August 3. Here the case was diagnosed typhoid fever, and the patient was furloughed September 26.
No. 112. Company M: Typhoid fever, August 3; furloughed from Sternberg Hospital August 20.
No. 113. Company G: Dysentery, August 4; died in division hospital August 15.
No. 114. Company I: Continued fever, August 4; still sick in division hospital August 31.
No. 115. Company C: Diarrhea, August 5 to 23.
No. 116. Company K: Typhoid fever, August 5; disposition not given.
No. 117. Company M: Typhoid fever, August 5; disposition not given.
No. 118. Company G: Intermittent malaria, August 5 to 17.
No. 119. Company D: Intermittent malaria, August 5; still sick in division hospital August 31.
No. 120. Company G: Typhoid fever, August 5; still sick in division hospital August 31.
No. 121. Company C: Intermittent malaria, August 6; furloughed from division hospital September 17. In hospital this case was diagnosed typhoid fever.
No. 122. Company F: Malaria, August 6; furloughed from division hospital August 27. In hospital this case was diagnosed continued malaria.
No. 123. Company A: Continued malaria, August 6; furloughed from division hospital August 28.
No. 124. Company E: Diarrhea, August 6; still sick in division hospital August 31.
No. 125. Company C: Typhoid fever, August 6; still sick in division hospital August 31.
No. 126. Company L: Typhoid fever, August 6; disposition not given.
No. 127. Company C: Intermittent malaria, August 7 to 26.
No. 128. Company E: Typhoid fever, August 7; still sick in division hospital August 31.
No. 129. Company C: Typhoid fever, August 7; furloughed from division hospital August 28.
No. 130. Company A: Typhoid fever, August 7; furloughed from division hospital August 28.
No. 131. Company K: Typhoid fever, August 7; furloughed from division hospital August 17.
No. 132. Company M: Typhoid fever, August 8; still sick in division hospital August 31.
No. 133. Company A: Intermittent malaria, August 9 to 25.
No. 134. Company K: Typhoid fever, August 9; died September 2.
No. 135. Company I: Typhoid fever, August 10; furloughed from division hospital August 24.
No. 136. Company H: Continued malaria, August 10; furloughed from division hospital August 31.
No. 137. Company M: Typhoid fever, August 11; still sick in division hospital August 31.

No. 139. Company L: Intermittent malaria, August 12; still sick in division hospital August 31. In hospital this case was diagnosed typhoid fever.
No. 140. Company L: Intermittent malaria, August 12; furloughed August 27.
No. 141. Company E: Typhoid fever, August 13; furloughed from Leiter Hospital October 23.
No. 142. Company F: Typhoid fever, August 13; still sick in division hospital August 31.
No. 143. Company M: Typhoid fever, August 13; furloughed from Sternberg Hospital October 4.
No. 144. Company K: Intermittent malaria, August 14; furloughed August 28.
No. 145. Company B: Remittent malaria, August 15; furloughed August 29.
No. 146. Company L: Remittent malaria, August 15 to September 4.
No. 147. Company I: Diarrhea, August 15; still sick in division hospital August 31.
No. 148. Company G: Intermittent malaria, August 15 to September 12.
No. 149. Company I: Typhoid fever, August 15; furloughed from Sternberg Hospital October 24.
No. 150. Company H: Remittent malaria, August 16 to 31.
No. 151. Company K: Typhoid fever, August 16; furloughed from Sternberg Hospital August 20.
No. 152. Company G: Typhoid fever, August 16; died in Sternberg Hospital August 25.
No. 153. Company G: Diarrhea, August 16 to September 6.

No. 154. Company A: Typhoid fever, August 16; furloughed from Sternberg Hospital September 2.

No. 155. Company G: Intermittent malaria, August 17 to September 1.

No. 156. Company H: Intermittent malaria, August 17 to September 6.

No. 157. Company C: Hepatic torpor, August 17; furloughed from division hospital September 15. In hospital this case was diagnosed typhoid fever.

No. 158. Company H: Undetermined fever August 18; still sick September 30.

No. 159. Company G: Remittent malaria, August 18; furloughed from Sternberg Hospital October 4.

No. 160. Company M: Dysentery, August 19; still sick in Sternberg Hospital September 30. In hospital this case was diagnosed typhoid fever.

No. 161. Company H: Intermittent malaria, August 19 to September 6.

No. 162. Company G: Intermittent malaria, August 20; still sick in Sternberg Hospital September 30. In hospital this case was diagnosed typhoid fever.

No. 163. Company D: Intermittent malaria, August 20; furloughed from division hospital October 4. In hospital this case was diagnosed typhoid fever.

No. 164. Company F: Intermittent malaria, August 20 to September 4.

No. 165. Company F: Intermittent malaria, August 22; furloughed September 30.

No. 166. Company F: Typhoid fever, August 22; furloughed from Sternberg Hospital October 6.

No. 167. Company G: Remittent malaria, August 25; furloughed from Sternberg Hospital September 25. In hospital this case was diagnosed typhoid fever.

No. 168. Company G: Intermittent malaria, August 25 to September 21.

No. 169. Company K: Typhoid fever, August 26; furloughed from Sternberg Hospital September 26.

No. 170. Company H: Intermittent malaria, August 26 to October 14.

No. 171. Company H: Intermittent malaria, August 26; furloughed September 6.

No. 172. Company L: Intermittent malaria, August 26; furloughed September 8.

No. 173. Company B: Undetermined fever, August 27; still sick in Sternberg Hospital September 30. In hospital this case was diagnosed typhoid fever.

No. 174. Company C: Remittent malaria, August 27; still sick in division hospital September 30.

No. 175. Company H: Intermittent malaria, August 27; furloughed September 12.

No. 176. Company G: Remittent malaria, August 27; furloughed September 12.

No. 177. Company G: Without date or diagnosis; sent to Leiter Hospital August 27. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 24.

No. 178. Company I: Hepatic torpor, August 28; sent to Sternberg Hospital September 4. Here the disease was diagnosed typhoid fever, and the patient was furloughed October 4.

No. 179. Company C: Intermittent malaria August 28; still sick in division hospital September 30.

No. 180. Company E: Intermittent malaria, August 29; furloughed September 13.

No. 181. Company D: Remittent malaria, August 29; furloughed from Sternberg Hospital October 4. In hospital this case was diagnosed typhoid fever.

No. 182. Company H: Malaria, August 29; furloughed from Sternberg Hospital September 7. In hospital this case was diagnosed typhoid fever.

No. 183. Company not given: Typhoid fever, August 30; sent to Sternberg Hospital August 31.

No. 184. Company D: Intermittent malaria, August 30; still sick in division hospital September 30.

No. 185. Company E: Remittent malaria, August 30; furloughed from Sternberg Hospital September 17. In hospital this case was diagnosed continued malaria.

No. 186. Company I: Intermittent malaria, August 31; still sick in hospital September 30.

No. 187. Company H: Remittent malaria, August 31; furloughed September 14.

No. 188. Company L: Without date or diagnosis; sent to Sternberg Hospital August 31. Here the disease was diagnosed typhoid fever, and the patient was furloughed October 15.

No. 189. Company K: Without date or diagnosis; sent to Sternberg Hospital August 31. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 10.

No. 190. Company B: Remittent malaria, August 31; furloughed from Sternberg Hospital October 4.

No. 191. Company G: Diarrhea, August 31; furloughed from Sternberg Hospital October 7. In hospital this case was diagnosed remittent malaria.

No. 192. Company F: Without date or diagnosis; sent to Sternberg Hospital August 31. Here the disease was diagnosed remittent malaria, and the patient was furloughed September 23.

No. 193. Company M: Typhoid fever, August 31; furloughed September 7.

No. 194. Company F: Remittent malaria, September 1; furloughed from Sternberg Hospital October 14. In hospital this case was diagnosed typhoid fever.

No. 195. Company B: Remittent malaria, September 1; furloughed from Sternberg Hospital October 7. In hospital this case was diagnosed typhoid fever.

No. 196. Company D: Intermittent malaria, September 1; furloughed September 12.

No. 197. Company A: Malaria, September 3; still sick in Sternberg Hospital September 30. In hospital this case was diagnosed typhoid fever.

No. 198. Company A: Intermittent malaria, September 3; furloughed from Sternberg Hospital September 8. In hospital this case was diagnosed typhoid fever.

No. 199. Company F: Remittent malaria, September 3; still sick in Sternberg Hospital September 30.

No. 200. Company H: Diarrhea, September 3; furloughed September 14.

No. 201. Company M: Remittent malaria, September 3; furloughed from Sternberg Hospital September 17. In hospital this case was diagnosed typhoid fever.

No. 202. Company A: Remittent malaria, September 3; still sick in Sternberg Hospital September 30. In hospital this case was diagnosed typhoid fever.

No. 203. Company L: Without date or diagnosis; sent to Sternberg Hospital September 3. Here the disease was diagnosed continued malaria, and the patient was furloughed October 4.

No. 204. Company K: Remittent malaria, September 3 to 27.

No. 205. Company H: Hepatic torpor, September 3; furloughed September 13.

No. 206. Company G: Diarrhea, September 3; furloughed September 13.

No. 207. Company K: Intermittent malaria, September 3 to 21.

No. 208. Company C: Without date or diagnosis; sent to Sternberg Hospital September 3. Here the disease was diagnosed typhoid fever, and the patient was furloughed October 4.

No. 209. Company L: Typhoid fever, September 4; furloughed from Sternberg Hospital October 4.

No. 210. Company H: Diarrhea, September 4; furloughed from Sternberg Hospital October 20. In hospital this case was diagnosed typhoid fever.

No. 211. Company A: Hepatic torpor, September 5; furloughed from Sternberg Hospital October 21. In hospital this case was diagnosed typhoid fever.

No. 212. Company L: Intermittent malaria, September 5; still sick in division hospital September 30. In hospital this case was diagnosed typhoid fever.

No. 213. Company F: Without date or diagnosis; sent to Sternberg Hospital September 5. Here the disease was diagnosed typhoid fever, and the patient was furloughed October 8.

No. 214. Company C: Without date or diagnosis; sent to Sternberg Hospital September 5. Here the disease was diagnosed typhoid fever, and the patient was furloughed October 4.

No. 215. Company G: Without date or diagnosis; sent to Sternberg Hospital September 5. Here the disease was diagnosed typhoid fever, and the patient was furloughed October 5.

No. 216. Company L: Without date or diagnosis; sent to Sternberg Hospital September 5. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 26.

No. 217. Company K: Remittent malaria, September 5; furloughed from Sternberg Hospital September 9. In hospital this case was diagnosed typhoid fever.

No. 218. Company D: Without date or diagnosis; sent to Sternberg Hospital September 5. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 14.

No. 219. Company E: Typhoid fever, September 5; disposition not given.

No. 220. Company H: Constipation, September 6; furloughed from Sternberg Hospital September 17. In hospital this case was diagnosed typhoid fever.

No. 221. Company I: Intermittent malaria, September 6; still sick in Sternberg Hospital September 30. In hospital this case was diagnosed typhoid fever.

No. 222. Company B: Diarrhea, September 7 to 22.

No. 223. Company K: Remittent malaria, September 7 to October 5.

No. 224. Company L: Typhoid fever, September 7; furloughed from Sternberg Hospital October 3.

No. 225. Company L: Typhoid fever, September 7; furloughed from Sternberg Hospital October 13.

No. 226. Company D: Intermittent malaria, September 7; still sick in division hospital September 30.

No. 227. Company I: Diarrhea, September 7 to October 14.

No. 228. Company M: Intermittent malaria, September 7 to 28.

No. 229. Company K: Remittent malaria, September 7 to 28.

No. 230. Company B: Without date or diagnosis; sent to Sternberg Hospital September 8. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 22.

No. 231. Company E: Without date or diagnosis; sent to Sternberg Hospital September 8. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 17.

No. 232. Company D: Remittent malaria, September 8 to October 5.

No. 233. Company G: Remittent malaria, September 8; furloughed from Sternberg Hospital September 17.

No. 234. Company D: Diarrhea, September 8 to 30.

No. 235. Company H: Diarrhea, September 8 to 27.

No. 236. Company L: Remittent malaria, September 8; still sick September 30.

No. 237. Company A: Without date or diagnosis; sent to Sternberg Hospital September 8. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 17.

No. 238. Company H: Without date or diagnosis; sent to Sternberg Hospital September 8. Here the disease was diagnosed typhoid fever, and the patient was furloughed September 10.

No. 239. Company B: Intermittent malaria, September 11 to 28.

No. 240. Company E: Remittent malaria, September 11 to 26.

No. 241. Company K: Remittent malaria, September 11 to 24.

No. 242. Company F: Remittent malaria, September 11 to October 16.

No. 243. Company F: Jaundice, September 11; still sick October 31.

No. 244. Company I: Intermittent malaria, September 12 to 30.

No. 245. Company K: Jaundice, September 12 to 27.

No. 246. Company I: Remittent malaria, September 12 to October 6.

No. 247. Company H: Remittent malaria, September 13 to October 2.

No. 248. Company I: Remittent malaria, September 14 to October 10.

No. 249. Company K: Remittent malaria, September 14 to October 5.

No. 250. Company G: Intermittent malaria, September 15 to October 7.

No. 251. Company M: Remittent malaria, September 15 to October 6.

No. 252. Company L: Remittent malaria, September 16 to October 6.

No. 253. Civilian: Remittent malaria, September 16 to October 13.

No. 254. Company D: Typhoid fever, September 17; furloughed September 30.

No. 255. Company K: Typhoid fever, September 18 to October 13.

No. 256. Company F: Remittent malaria, September 19 to October 6.

No. 257. Company not given: Remittent malaria, September 19 to October 8.

No. 258. Company A: Remittent malaria, September 20 to October 7.

No. 259. Company A: Remittent malaria, September 20 to October 17.

No. 260. Company L: Remittent malaria, September 20 to October 5.

No. 261. Company K: Diarrhea, September 20 to October 5.

No. 262. Company C: Remittent malaria, September 20; furloughed October 15.

No. 263. Company A: Remittent malaria, September 21; still sick October 31.

No. 264. Company K: Remittent malaria, September 22 to October 13.

No. 265. Company D: Remittent malaria, September 23 to October 12.

No. 266. Staff: Typhoid fever, September 23; died September 30.

No. 267. Company D: Remittent malaria, September 23 to October 20.

No. 268. Company I: Diarrhea, September 23 to October 27.

No. 269. Company I: Intermittent malaria, September 23 to October 10.

No. 270. Company M: Remittent malaria, September 24 to October 17.

No. 271. Company D: Remittent malaria, September 24; still sick in hospital October 31.

No. 272. Company K: Remittent malaria, September 25 to October 15.

No. 273. Company L: Remittent malaria, September 25 to October 14.

No. 274. Company L: Remittent malaria, September 25 to October 26.

No. 275. Company E: Remittent malaria, September 25 to October 26.

No. 276. Company M: Remittent malaria, September 25 to October 27.

No. 277. Company H: Malaria, September 26 to October 14.

No. 278. Company D: Remittent malaria, September 26 to October 16.

No. 279. Company I: Remittent malaria, September 26; furloughed October 4.

No. 280. Company B: Remittent malaria, September 26; still sick in hospital October 31.

No. 281. Company L: Remittent malaria, September 28 to October 22.

No. 283. Company M: Diarrhea, September 29; still sick in hospital October 31.

No. 284. Company F: Remittent malaria, September 30; still sick in hospital October 31.

No. 285. Company M: Diarrhea, September 30 to October 14.

No. 286. Company F: Typhoid fever, October 4; still sick in hospital October 31.

No. 287. Company H: Remittent malaria, October 4 to 22.

SUMMARY.

Assembled at Camp Dodge, Little Rock, Ark., in April and May,
1898.

Mustered into United States service May 27, 1898.

Arrived at Chickamauga Park, Ga., May 30, 1898.

Strength on arrival, 1,029.

Date of first case of probable typhoid fever, June 4, 1898.

Date of first case of recognized typhoid fever, June 15, 1898.

Left Chickamauga Park, Ga., September 9, 1898.

Strength on departure, 1,291.

Number of cases of probable typhoid fever developed at Chick-amauga	238
---	-----

Arrived at Anniston, Ala., September 10, 1898.

Number of cases of probable typhoid fever developed after leaving Chickamauga.....	49
--	----

Total number of cases of probable typhoid fever developed in the Second Arkansas Volunteer Infantry from May to October, 1898	287
---	-----

These 287 cases were diagnosed as follows:

Typhoid fever.....	95
Malaria.....	153
Diarrhea.....	28
Dysentery.....	3
Jaundice.....	2
Hepatic torpor.....	3
Hepatic engorgement.....	1
Undetermined fever.....	2

Total	287
-------	-----

The following is an alphabetical list of total deaths in this regiment, so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
		1898.		
Bizzell, Albert	Pvt., G	Aug. 19	Fort McPherson, Ga.	Typhoid.
Blankinship, Walter	Pvt., G	July 22	Chickamauga, Ga.	Do.
Carroll, J. L. D.	Pvt., D	Feb. 16	Camp Shipp, Ala.	Croupous pneumonia.
Davis, Isaac H.	Pvt., K	Aug. 29	Chickamauga, Ga.	Typhoid.
Engle, Wm. M.	Pvt. B	Aug. 16	Camp Thomas, Ga.	Do.
Erwin, Joseph J.	Pvt., I	Aug. 29	Chickamauga, Ga.	Pneumonia.
Evans, Commodore.	Pvt., G	Aug. 25	do	Typhoid.
Fowler, Wm. H.	Pvt., F.	Sept. 18	Sternberg Hospital, Ga.	Do.
Hays, David	Pvt., H.	Nov. 15	Home, Montgomery County, Tenn.	Pneumonia.
Johnson, James J.	Major.	Sept. 30	Anniston, Ala.	Typhoid.
Lee, Charles H.	Pvt., F.	Sept. 1	Camp Thomas, Ga.	Cerebral apoplexy.
Lewis, Artum G.	Pvt., M.	Sept. 1	do	Typhoid.
McKay, Samuel	Pvt., H.	Aug. 23	do	Pneumonia.
Martin, John W.	Pvt., H.	Dec. 7	Walnut Ridge, Ark.	Typhoid.
Obannon, Edward	Pvt., G.	Sept. 10	do	Do.
Otis, Joseph T.	1st Sgt., D.	July 31	Chickamauga, Ga.	Do.
Prather, Gordon G.	Pvt., A.	Sept. 23	Camp Shipp, Ala.	Cerebro-spinal meningitis.

COMMUNICATIONS FROM THE SURGEONS OF THE SECOND
ARKANSAS VOLUNTEER INFANTRY.

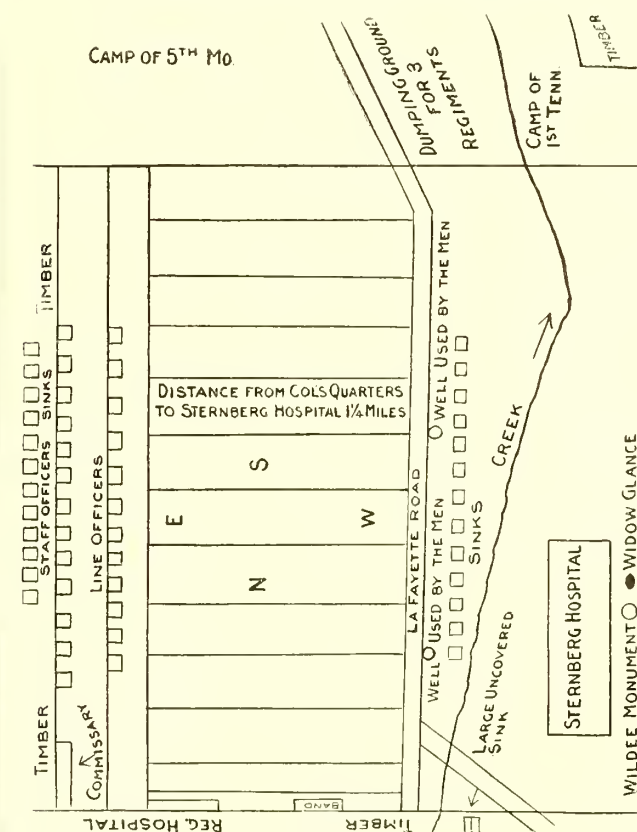

Medical Officers.

Horatio Wells, major and surgeon, Dermott, Ark.

Strodder U. King, lieutenant and assistant surgeon, Little Rock,
Ark.

Robert M. Enders, sr., lieutenant and assistant surgeon, Little Rock, Ark.

DIAGRAM OF THE SECOND CAMP OF THE SECOND ARKANSAS VOL-
UNTEER INFANTRY AT CHICKAMAUGA PARK.

Lieut. S. U. King states:

When I joined the regiment, August 2, 1898, it had moved the week before out of the woods into an open field, which sloped from the timber line on the east to and slightly beyond the Lafayette road on the west, beyond which the ground gradually rose until Sternberg Hospital was reached, a distance of three-quarters of a mile still farther west. Through the valley, between our camp and Sternberg Hospital, ran two streams, the water of either

of which could in summer be carried in a 6-inch pipe. The one nearest Sternberg Hospital was always dry except when it rained. At such times it drained "Bloody Pond." The other stream, which was nearer us, carried more water, and when we had heavy rains it became a torrent, flooding the bottom and washing out the contents of the sinks used by the men, which were dug between this stream and the Lafayette road, as is shown by the rough sketch I send you.

Before I joined the regiment it had been camped all the time in the dense woods, and through July it rained almost every day, so that it was impossible to keep the equipment, clothing, and bedding of the men dry. The result was that everything mildewed. The camp occupied by the regiment when I joined it was an ideal one. There was not a tree or shrub in it, and the country to the west for a mile and a quarter was open, also to the south for some distance. The ground of this camp inclined sharply to the west, and the drainage was perfect, so that within an hour after the hardest rains no mud or water could be found within the limits of our camp.

The water supply of this camp was bad. It was taken from two wells situated on the west side of the Lafayette road, which were very near the sinks used by the men. Another source of water supply was from a pipe into which was pumped water from Chickamauga Creek. This water was always muddy, and the men were afraid of it and finally abandoned it save for washing purposes and for use at the corral. Later an analysis ordered by the War Department reported this water to be pure and wholesome. The sinks at this camp were entirely inadequate for the purpose and were located too close to the quarters of the men. It was impossible to dig them more than 4 feet, and many of them were not more than 3 feet deep, though I am compelled to say that the digging was sometimes stopped before rock was reached. These sinks were often sadly neglected, in that they were not filled soon enough and new ones dug. They would fill with surface and seep water, so that a rain would cause them to flow out over the surface of the ground, thus creating centers of infection, odors, and disease. The flies were so numerous as to make it almost impossible to eat a meal unless protected by mosquito nets. Our regimental and division hospitals were infested by them in almost incredible numbers.

I am persuaded that if the men had been properly controlled, and had not been allowed to exercise their own will as to what they should eat and drink, and that if the medical department had carried out the instructions as issued by the Surgeon-General early in the summer, that 75 per cent of the sickness which occurred in the regiment while at Chickamauga could have been prevented. There was nothing in the local situation, until it became polluted by their own careless and filthy habits, to make men sick. All of our cases of diarrhea and cramps were easily traced to the common origin of stale pies and watermelons, secured by the men from wagons which were allowed to stop at the foot of our regiment.

We went into camp at Anniston, Ala., September 10, 1898, in thick woods and rain, locating our tents as best we could without any order, where we stayed two days, after which we were ordered to move to the top of a hill, which sloped to the north. This camp was soon cleared of the underbrush and smaller timber. We made this camp almost perfect during the following two months. Sickness declined, and the men gathered strength and color; diarrhea disappeared from the camp like magic. The records will show how well we got along, until far into December, when we had an epidemic of la grippe, which again filled our hospitals. Pneumonia and cerebro-spinal meningitis appeared at this time, though one fatal case of cerebro-spinal meningitis had developed on the day we went into camp at this place. No other cases appeared until late in November, or until a few weeks before the epidemic of la grippe. From these facts I was of the opinion that there was no relationship between the cerebro-spinal meningitis and la grippe, as was believed by some of the surgeons.

The sinks at this camp were perfect, as such things go. They

were dug 8 feet deep, 2 feet wide, and 20 feet long, covered by a house in which a long seat with, perhaps, a dozen holes, each with a cover on a hinge. Along the opposite side a urinal was made, and conducted the urine into the sinks. Lime was used freely. Ditches were cut and the dirt from them thrown up around the buildings high enough to keep out surface water. Colonel Cobbell was in command, and these sinks were not neglected. I neglected to say that the sinks at Camp Thomas were covered only with old worn-out tents and some of them not at all. Those which were left uncovered were located in the woods and had a pole set up on two forks which were used to sit upon.

The drainage at Camp Shipp was also perfect, so that we had no standing water or mud. The officers' streets and a few of the company streets were covered with a beautiful white sand, handled by the quartermaster's department. This sand was placed around the regimental hospital, in front of which I built a beautiful fountain in the shape of a Maltese cross. The water supply was the most perfect, I suppose, of any camp in the South. It was that used by the city of Anniston and came from an enormous spring 8 miles southwest of the city. It was conducted in pipes from the city to our camp and was supplied in unlimited quantities. It was perfectly clean, limpid, and sweet at all times. I believe the typhoid fever which occurred at this camp, and which first appeared in the Fourth Wisconsin Regiment, was brought to it from Cuba by the men of the Second Regular Infantry, who were camped alongside of them. Sporadic cases were, to my mind, accounted for by the use of water from an old spring situated in Anniston, under a high railroad embankment, very near a privy used by the employees of a manufactory of wooden ware. This spring was on a line of travel much used by the men in going from camp to the city and return. I was so confident of this source of infection that I reported it to General Frank, who had it nailed up.

SIXTY-NINTH NEW YORK VOLUNTEER INFANTRY.

Second Brigade, Second Division, Third Army Corps.

This regiment reached Chickamauga Park May 27, 1898, and left for Tampa, Fla., June 2. At Tampa it became a part of the Fourth Army Corps and continued with that corps throughout its service.

The first report is for the month of June.

CONDENSED SICK REPORT FOR JUNE.

Mean strength	1,036
Diarrhea.....	112
Dysentery	1
Intermittent malaria.....	16
Remittent malaria.....	3
Other diseases.....	38
Total	170

Four cases of malaria and two of diarrhea were, according to the regimental records, sent to hospital. The two cases of diarrhea proved to be typhoid fever, as shown by the hospital records.

There is no report for July.

During the latter part of July this regiment was transferred to Fernandina, Fla.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength	1,274
Diarrhea.....	2
Dysentery	5
Malaria.....	80
Typhoid fever.....	44

Accidental injury.....	28
Other diseases.....	51
Total	210

Late in August this regiment was transferred from Fernandina, Fla., to Huntsville, Ala. While making this transfer a railroad accident happened, in which 28 persons were injured.

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength	1,267
Dysentery	23
Diarrhea.....	5
Intermittent malaria.....	144
Remittent malaria.....	2
Accidental injury.....	15
Typhoid fever.....	63
Other diseases.....	67
Total	319

CONDENSED SICK REPORT FOR OCTOBER.

Mean strength	1,186
Dysentery	9
Malaria.....	77
Typhoid fever.....	36
Enteritis.....	5
Other diseases.....	96
Total	223

The following is a list of the recognized and probable cases of typhoid fever in this regiment:

No. 1. Company G: Diarrhea, June 12 to 25.

No. 2. Company C: Sent to hospital June 23 without diagnosis. Here the disease was diagnosed typhoid fever, and the patient was transferred to some other hospital (name not given) June 30.

No. 3. Company E: Sent to hospital June 23 without diagnosis. Here the disease was diagnosed malaria, and the patient was transferred June 30.

No. 4. Company A: Sent to hospital June 23 without diagnosis. Here the disease was diagnosed typhoid fever, and the patient was transferred June 30.

No. 5. Company C: Sent to hospital June 27 without diagnosis. Here the disease was diagnosed dysentery, and the patient was transferred June 30.

It will save time and space to state here that, unless otherwise designated, all initial dates refer to time of admission to hospital. Really we have no regimental record of disease, and we have been compelled to rely wholly upon hospital reports.

No. 6. Company I: Typhoid fever, July 3; transferred July 14.

No. 7. Company E: Typhoid fever, July 9; sent to Fort McPherson July 14.

No. 8. Company F: Typhoid fever, July 9; transferred to Atlanta July 14.

No. 9. Company L: Typhoid fever, July 10; died July 14.

No. 10. Company A: Malaria, July 12 to August 12.

No. 11. Company E: Intermittent malaria, July 14; furloughed July 19.

No. 12. Company L: Malaria, July 16; furloughed July 24.

No. 13. Company not given: Typhoid fever, July 19; died on train from Tampa to Fort Thomas.

No. 14. Company K: Malaria, July 19; sent to Fort Thomas July 22; discharged September 16.

No. 15. Company H: Chronic diarrhea, July 19; still sick August 31.

No. 16. Company M: Typhoid fever, July 19; transferred to Fort Thomas July 22; furloughed November 3.

No. 17. Company F: Malaria, July 20; sent to Fort Thomas August 29. Here the disease was diagnosed typhoid fever, and the patient was discharged October 22.

No. 18. Company K: Remittent malaria, July 20; sent to Fort Thomas July 22; discharged October 8.

No. 19. Company K: Malaria, July 20; no record of return to duty.

No. 20. Company K: Diarrhea, July 20; still sick in hospital July 31.

No. 21. Company G: Dysentery July 21; sent to Fort Thomas July 27. Here the disease was diagnosed typhoid fever, and the man was still sick at last report.

No. 22. Company K: Malaria and dysentery, July 21; still sick in hospital August 31.

No. 23. Company H: Malaria, July 21; still sick in hospital August 31.

No. 24. Company F: Remittent malaria, July 22; furloughed September 24.

No. 25. Company B: Typhoid fever, July 23; transferred July 27.

No. 26. Company A: Malaria, July 23; furloughed August 4.

No. 27. Company K: Typhoid fever, July 23; sent to Fort Thomas July 29; discharged September 27.

No. 28. Company B: Typhoid fever, July 23; sent to Fort Thomas July 29; furloughed August 24.

No. 29. Company H: Intermittent malaria, July 24; furloughed July 25.

No. 30. Company D: Typhoid fever, July 24; sent to Fort Thomas July 29; furloughed August 16.

No. 31. Company B: Typhoid fever, July 24; sent to Fort Thomas July 29; furloughed September 20.

No. 32. Company K: Remittent malaria, July 24; sent to Fort Thomas July 29; discharged September 16.

No. 33. Company F: Typhoid fever, July 30; sent on hospital train August 7.

No. 34. Company K: Typhoid fever, July 30; died August 10.

No. 35. Company C: Typhoid fever, July 30; died August 2.

No. 36. Company C: Typhoid fever, July 30; sent to Fort Thomas and discharged October 25. The records of the hospital at Fort Thomas show that this patient was received at that hospital July 29.

No. 37. Company H: Typhoid fever, July 30; sent North on hospital train August 7.

No. 38. Company F: Typhoid fever, July 30; transferred August 29.

No. 39. Company F: Typhoid fever, July 30; sent on hospital train August 7.

No. 40. Company E: Typhoid fever, July 30; sent on hospital train August 1.

No. 41. Company M: Typhoid fever, August 1; sent on hospital train August 19.

No. 42. Company C: Typhoid fever, August 1; furloughed September 6.

No. 43. Company C: Typhoid fever, August 2; sent on hospital train September 6.

No. 44. Company G: Typhoid fever, August 3; transferred August 29.

No. 45. Company H: Typhoid fever, August 3; sent on hospital train August 23.

No. 46. Company H: Typhoid fever, August 3; sent to Fort Thomas August 20; discharged October 19.

No. 47. Company M: Typhoid fever, August 3; transferred August 5.

No. 48. Company G: Typhoid fever, August 4; sent on hospital train August 29.

No. 49. Company H: Typhoid fever, August 5; furloughed August 23.

No. 50. Company B: Typhoid fever, August 5; sent to Fort Thomas September 7; furloughed September 29.

No. 51. Company A: Typhoid fever, August 5; sent North on hospital train August 7.

No. 52. Company M: Typhoid fever, August 5; furloughed August 25.

No. 53. Company M: Typhoid fever, August 5; sent North on hospital train August 7.

No. 54. Company F: Typhoid fever, August 6; sent North on hospital train August 7.

No. 55. Company G: Typhoid fever, August 6; furloughed August 29.

No. 56. Company F: Typhoid fever, August 6; sent North on hospital train August 7.

No. 57. Company G: Typhoid fever, August 6; transferred on hospital train August 7.

No. 58. Company C: Typhoid fever, August 8 to September 7.

No. 59. Company F: Typhoid fever, August 8; furloughed from Fort McPherson September 17.

No. 60. Company H: Malaria, August 8; furloughed from hospital August 24.

No. 61. Company H: Intermittent malaria, August 8; furloughed from hospital September 7.

No. 62. Company C: Malaria, August 8; furloughed from hospital September 13.

No. 63. Company F: Malaria, August 8; furloughed from hospital August 24.

No. 64. Company M: Intermittent malaria, August 8; furloughed August 29.

No. 65. Company E: Typhoid fever, August 8; transferred August 29.

No. 66. Company B: Malaria, August 8; furloughed from hospital September 5.

No. 67. Company A: Malaria, August 8; furloughed from hospital September 5.

No. 68. Company M: Intermittent malaria, August 8; furloughed from hospital October 15.

No. 69. Company F: Typhoid fever, August 8; furloughed from Fort McPherson September 14.

No. 70. Company K: Typhoid fever, August 8; discharged from Fort Thomas September 26.

No. 71. Company D: Typhoid fever, August 8; furloughed from hospital September 27.

No. 72. Company K: Malaria, August 8; furloughed from hospital September 14.

No. 73. Company D: Malaria, August 8; furloughed from hospital August 28.

No. 74. Company D: Typhoid fever, August 10; discharged from Fort Thomas October 12.

No. 75. Company B: Typhoid malaria, August 10; furloughed August 18.

No. 76. Company K: Typhoid fever, August 11; furloughed from Fort Thomas September 30.

No. 77. Company C: Typhoid fever, August 13; transferred August 29.

No. 78. Company K: Typhoid fever, August 13; furloughed from Fort Thomas November 4. In this case typhoid fever was followed by cystitis.

No. 79. Company K: Typhoid fever, August 14; transferred August 17.

No. 80. Company K: Typhoid fever, August 14; transferred August 17.

No. 81. Company E: Typhoid fever, August 15; furloughed from hospital September 2.

No. 82. Company L: Typhoid fever, August 16; transferred August 17.

No. 83. Company G: Intermittent malaria, August 18; furloughed August 31.

No. 84. Company H: Diarrhea, August 18 to 30.

No. 85. Company H: Malaria, August 18; furloughed August 29.

No. 86. Company B: Typhoid fever, August 19; furloughed August 26.

No. 87. Company L: Typhoid fever, August 19; transferred August 29.

No. 88. Company D: Typhoid fever, August 21; transferred August 29.

No. 89. Company F: Malaria, August 24; furloughed from hospital September 6.

No. 90. Company H: Malaria, August 27; furloughed from hospital September 5.

No. 91. Company E: Typhoid fever, August 28; furloughed from hospital September 16.

No. 92. Company G: Malaria, August 28; furloughed from hospital September 1.

No. 93. Company E: Malaria, August 29; furloughed from hospital September 1.

No. 94. Company H: Malaria, August 29; furloughed from hospital September 3.

No. 95. Company I: Malaria, August 29; furloughed from hospital September 2.

No. 96. Company A: Malaria, August 29; furloughed from hospital September 5.

No. 97. Company I: Typhoid fever, August 29; furloughed from hospital September 1.

No. 98. Company C: Typhoid fever, August 29; disposition not given.

No. 99. Company G: Typhoid fever, August 29; furloughed from hospital September 6.

No. 100. Company B: Typhoid fever, August 29; furloughed; disposition not given.

No. 101. Company A: Malaria, August 29; furloughed from hospital September 1.

No. 102. Company M: Malaria, August 29; furloughed from hospital September 1.

No. 103. Company G: Typhoid fever, August 29; furloughed from hospital September 6.

No. 104. Company K: Typhoid fever, August 29; furloughed from hospital September 12.

No. 105. Company A: Typhoid fever, August 29; furloughed from hospital September 20.

No. 106. Company D: Typhoid fever, August 29; disposition not given.

No. 107. Company G: Typhoid fever, August 29; furloughed from hospital September 16.

No. 108. Company A: Typhoid fever, August 29; disposition not given.

No. 109. Company A: Malaria, August 29; furloughed from hospital September 5.

No. 110. Company F: Malaria, August 29; furloughed from hospital September 1.

No. 111. Company G: Typhoid fever, August 29; furloughed from hospital September 16.

No. 112. Company B: Typhoid fever, August 29; furloughed from hospital September 26.

No. 113. Company M: Typhoid fever, August 29; died in hospital September 12.

No. 114. Company H: Malaria, August 29; furloughed from hospital September 6.

No. 115. Company G: Malaria, August 29; furloughed from hospital September 3.

No. 116. Company G: Malaria, August 29; furloughed from hospital September 5.

No. 117. Company E: Malaria, August 29; furloughed from hospital September 3.

No. 118. Company B: Typhoid fever, August 30; disposition not given.

No. 119. Company D: Malaria, August 31; still sick September 30.

No. 120. Company B: Typhoid fever, September 1; disposition not given.

No. 121. Company E: Typhoid fever, September 1; disposition not given.

No. 122. Company A: Typhoid fever, September 1; disposition not given.

No. 123. Company I: Typhoid fever, September 1; disposition not given.

No. 124. Company B: Typhoid fever, September 1; disposition not given.

No. 125. Company M: Typhoid fever, September 1; furloughed from hospital September 3.

No. 126. Company G: Typhoid fever, September 1; furloughed from hospital September 7.

No. 127. Company F: Typhoid fever, September 2; disposition not given.

No. 128. Company B: Typhoid fever, September 2; furloughed from hospital September 16.

No. 129. Company G: Malaria, September 2; furloughed from hospital September 5.

No. 130. Company B: Malaria, September 2; furloughed from hospital September 6.

No. 131. Company B: Typhoid fever, September 2; disposition not given.

No. 132. Company F: Typhoid fever, September 2; furloughed from hospital September 3.

No. 133. Company B: Malaria, September 3; furloughed from hospital September 7.

No. 134. Company A: Malaria, September 3; furloughed from hospital September 10.

No. 135. Company G: Malaria, September 3; furloughed from hospital September 3.

No. 136. Company A: Malaria, September 3; furloughed from hospital September 7.

No. 137. Company A: Typhoid fever, September 3; died in hospital September 20.

No. 138. Company I: Typhoid fever, September 5; disposition not given.

No. 139. Company M: Malarial fever, September 7; discharged from Fort Thomas October 12.

No. 140. Company H: Typhoid fever, September 7; died in hospital September 25.

No. 141. Company A: Typhoid fever, September 7; disposition not given.

No. 142. Company A: Typhoid fever, September 8; disposition not given.

No. 143. Company M: Malaria, September 8; furloughed from hospital September 13.

No. 144. Company A: Typhoid fever, September 8; disposition not given.

No. 145. Company M: Malaria, September 8; furloughed from hospital September 13.

No. 146. Company I: Malaria, September 8; disposition not given.

No. 147. Company M: Typhoid fever, September 9; disposition not given.

No. 148. Company E: Malaria, September 9; furloughed from hospital September 12.

No. 149. Company B: Malarial fever, September 10; furloughed September 18.

No. 150. Company F: Malaria, September 10; still sick September 30.

No. 151. Company M: Typhoid fever, September 11; disposition not given.

No. 152. Company I: Dysentery, September 11 to 26.

No. 153. Company M: Typhoid fever, September 11; died in hospital September 18.

No. 154. Company B: Typhoid fever, September 12; disposition not given.

No. 155. Company G: Typhoid fever, September 12; disposition not given.

No. 156. Company D: Malaria, September 12; furloughed from hospital September 14.

No. 157. Company K: Typhoid fever, September 12; furloughed from hospital September 24.

No. 158. Company C: Malaria, September 12; furloughed from Fort Thomas without date.

No. 159. Company A: Typhoid fever, September 12; disposition not given.

No. 160. Company L: Typhoid fever, September 12; disposition not given.

No. 161. Company D: Malaria, September 12; furloughed from hospital September 14.

No. 162. Company G: Malaria, September 12; furloughed from hospital September 24.

No. 163. Company A: Malaria, September 12; furloughed from hospital September 14.

No. 164. Company G: Malaria, September 12; furloughed from hospital September 13.

No. 165. Company G: Malaria, September 13; furloughed from hospital September 14.

No. 166. Company C: Malaria, September 13; furloughed from hospital September 15.

No. 167. Company E: Malaria, September 13; furloughed from hospital September 15.

No. 168. Company G: Malaria, September 13; died in hospital September 17.

No. 169. Company B: Typhoid fever, September 13; disposition not given.

No. 170. Company E: Typhoid fever, September 13; died in hospital September 25.

No. 171. Company E: Typhoid fever, September 14; disposition not given.

No. 172. Company H: Typhoid fever, September 14; disposition not given.

No. 173. Company I: Typhoid fever, September 14; disposition not given.

No. 174. Company E: Intermittent malaria, September 14; furloughed September 25.

No. 175. Company A: Typhoid fever, September 15; disposition not given.

No. 176. Company C: Typhoid fever, September 15; disposition not given.

No. 177. Company I: Typhoid fever, September 15; disposition not given.

No. 178. Company G: Typhoid fever, September 15; disposition not given.

No. 179. Company I: Typhoid fever, September 15; disposition not given.

No. 180. Company F: Typhoid fever, September 16; disposition not given.

No. 181. Company E: Typhoid fever, September 16; disposition not given.

No. 182. Company G: Typhoid fever, September 16; disposition not given.

No. 183. Company G: Typhoid fever, September 16; disposition not given.

No. 184. Company L: Intermittent malaria, September 16 to October 2.

No. 185. Company E: Typhoid fever, September 17; disposition not given.

No. 186. Company B: Typhoid fever, September 17; disposition not given.

No. 187. Company B: Malaria, September 17; disposition not given.

No. 188. Company F: Typhoid fever, September 17; disposition not given.

No. 189. Company F: Typhoid fever, September 17; disposition not given.

No. 190. Company I: Malaria, September 17; furloughed from hospital September 26.

No. 191. Company D: Typhoid fever, September 17; disposition not given.

No. 192. Company K: Typhoid fever, September 17; furloughed from hospital September 23. This man reported from furlough still sick with typhoid fever, and was then sent to Fort Thomas.

No. 193. Company D: Typhoid fever, September 17; disposition not given.

No. 194. Company K: Typhoid fever, September 17; furloughed from hospital September 20.

No. 195. Company H: Typhoid fever, September 17; disposition not given.

No. 196. Company I: Malaria; September 17; furloughed from hospital September 26.

No. 197. Company D: Typhoid fever, September 17; furloughed September 27.

No. 198. Company A: Malaria, September 17; furloughed from hospital September 19.

No. 199. Company B: Intermittent malaria, September 17; furloughed September 29.

No. 200. Company I: Malaria, September 18; furloughed September 19.

No. 201. Company C: Malaria, September 18; furloughed September 19.

No. 202. Company D: Malaria, September 18; furloughed from hospital September 19.

No. 203. Company D: Malaria, September 18; furloughed from hospital September 19.

No. 299. Company D: Enteric fever, November 11 to 25.

SUMMARY.

Assembled at Camp Black, Long Island, N. Y., in April, 1898.
 Mustered into United States service May 6, 1898.
 Arrived at Chickamauga Park, Ga., May 27, 1898.
 Strength on arrival, 1,036.
 Left Chickamauga Park June 2, 1898.
 Strength on departure, 1,026.
 Arrived at Ybor City, near Tampa, Fla., June 6, 1898.
 Date of first case of probable typhoid fever, June 12, 1898.
 Date of first case of recognized typhoid fever, June 23, 1898.
 Left Tampa, Fla., July 24, 1898.

Number of cases of probable typhoid fever developed at Tampa. 32

Arrived at Fernandina, Fla., July 25, 1898.
 Left Fernandina, Fla., August 27, 1898.

Number of cases of probable typhoid fever developed at Fernandina, Fla. 58

Arrived at Huntsville, Ala., September 1, 1898.

Number of cases of probable typhoid fever developed at Huntsville, Ala. 209

Total number of cases of probable typhoid fever developed in the Sixty-ninth New York Volunteer Infantry from May to November, 1898. 299

These 299 cases were diagnosed as follows:

Typhoid fever.....	191
Malaria.....	99
Diarrhea.....	4
Dysentery.....	2
Continued fever.....	2
Enteric fever.....	1
Total.....	299

It is evident that the surgeon of this regiment considered enteric fever and typhoid fever as distinct diseases.

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Burke, John	Pvt., B.	1898, Nov. 14	Huntsville, Ala.	Typhoid.
Casey, Thomas	Pvt., F.	Oct. 27do	Do.
Crowley, Daniel	Pvt., F.	July 21do	Do.
Donnelly, John	Pvt., K.	Nov. 16	Huntsville, Ala.	Do.
Donnelly, John F.	Pvt., D.	Oct. 8do	Do.
Dougherty, T. J.	Pvt., D.	1899, Jan. 30do	Pneumonia.
Duffy, Nicholas H.	Pvt., B.	1898, Aug. 29	Fernandina, Fla.	Typhoid.
Dwyer, Edward J.	Corpl., K.	Aug. 11do	Do.
Ellfott, James W.	Corpl., I.	Nov. 3	Huntsville, Ala.	Do.
Flynn, Maurice J.	Pvt., C.	Aug. 2	Fernandina, Fla.	Do.
Gallagher, C. A.	Corpl., G.	Sept. 17	Huntsville, Ala.	Do.
Hennissy, Michael J.	Pvt., I.	July 14	Tampa, Fla.	Do.
Hopkins, James	Pvt., I.	Nov. 13	Huntsville, Ala.	Do.
Kennedy, John	Pvt., M.	Sept. 18	Camp Wheeler, Ala.	Do.
McAree, Arthur	Pvt., H.	July 29	Hospital train coming from Tampa, Fla.	(Typhoid); exhaustion due to malarial fever.
Mulleharn, Matthew ..	Pvt., I.	Nov. 21	Huntsville, Ala.	Typhoid.
Murray, Henry	Pvt., H.	1899, Jan. 12do	Lobar pneumonia.
O'Brien, John J.	Corpl., K.	1898, Sept. 26do	Typhoid and dysentery.
O'Farrell, Robert.	Mus., A.	Aug. 19	Fort McPherson, Ga. .	Pneumonia and typhoid.
Pyne, William	Pvt., B.	Oct. 27	Huntsville, Ala.	Typhoid.
Reilly, John	Pvt., M.	Sept. 12	Camp Wheeler, Ga.	Do.
Sweeney, Wm	Pvt., C.	Sept. 5	New York City	(Typhoid); malaria.
Tracy, James	Corpl., A.	Sept. 10	Huntsville, Ala.	Typhoid.
Wray, Wm. A.	Mus., K.	July 26	Newport, Ky	(Typhoid); chronic dysentery.
Young, Thomas	Pvt., C.	Sept. 25	Huntsville, Ala.	Typhoid.

Total deaths..... 25
Deaths due to typhoid fever..... 23

Percentage of deaths among probable cases (299) of typhoid fever, 7.69.

Percentage of deaths among recognized cases of typhoid fever (191), 12.04.

For the following information concerning this regiment, we are indebted to Capt. John Fuchsius, assistant surgeon of the regiment:

On reaching Chickamauga this regiment encamped in the pine woods, and began immediately to haul its drinking water from a spring about a mile distant. A guard was placed at this spring to prevent anyone from contaminating it. The only visible evidence of possible contamination from local surroundings was a house with a barn located about 150 feet from the spring. The water was hauled to the regiment in barrels and was not boiled. The ground was very hard, but sinks could be dug to a depth of about 6 feet. These sinks were located at a distance of about 150 feet from the nearest mess tents. These sinks were kept in good condition, and their contents were covered morning, noon, and night. The kitchen sinks were covered every time anything was thrown into them. The regiment remained at Chickamauga only six days and then went to Tampa. At Tampa the water supply was obtained from a well which was said to be 200 or 300 feet deep, but competent engineers from the regiment were sent to examine it, and reported it not more than 40 feet deep. The water from this well was not at all times clear, and sometimes it had a salty taste. This is what was known as the Guerra, Diaz & Co. well. During the first two or three weeks

after reaching Tampa no heavy rains fell, and fairly good sinks were dug. After the rainy season set in sinks could be dug only to a depth of 2½ feet, when they filled with water. Later it was found impossible to dig sinks at all without striking water. After this a certain area of ground was set apart for the deposition of fecal matter, and a dike was built around it. This dumping-ground was located about 150 feet from the regimental line. Typhoid fever began to appear during the third week after the regiment reached Tampa. Captain Fuchsius placed the number of typhoid fever cases developed at Tampa at 29, while we have placed it, as has been stated, at 32. Dr. Fuchsius believes that the men became infected at Tampa by drinking lemonade sold by a huckster and made by water obtained from a cigar factory. He stated that there were three water-closets within 3 or 4 feet of this well, and that the well was a very shallow one. He believed that the typhoid fever was continued at Fernandina in a similar manner. He stated that when the regiment first reached Fernandina the men obtained their drinking water from a negro cabin. This water was of pleasant taste and the men drank freely of it, but after two days it was discovered that a privy was located within 6 or 8 feet of the well. However, the prevalence of typhoid fever continued quite unabated after this regiment reached Huntsville, Ala. While it is possible that many of the cases that appeared after reaching Huntsville were due to previous infection, it is more than probable that the spread of the infection continued at that place, and in our opinion the Huntsville water supply was unquestionably safe. There can be no question that the typhoid infection became quite widely diffused through this regiment while at Tampa, and this infection was carried with the men to Fernandina and subsequently to Huntsville. In our opinion, the fact mentioned by Captain Fuchsius that the sick men disliked to go to the hospital, and remained in quarters often for two or three weeks with typhoid fever, was a more potent factor in the distribution of this disease than infected water.

COMMUNICATIONS FROM THE SURGEONS OF THE SIXTY-NINTH NEW YORK VOLUNTEER INFANTRY.

Medical officers.

Francis L. Oswald, major and surgeon, New York City.
John H. Fuchsins, captain and assistant surgeon, New York City.
Robert M. Daley, lieutenant and assistant surgeon, New York City.

Lieutenant Daley writes:

I did not join the regiment until August. The camp at that time was at Fernandina, Fla., and was admirably situated on a sandy knoll, which was well drained. The short, scrubby bushes covering the soil were cut off, making a pleasant site, although the sand was deep, making marches and drills fatiguing. Water was supplied each company through pipes leading from an artesian well. This water contained considerable sulphur, giving it a disagreeable odor and taste, but it contained very little organic matter. The latrines were not properly covered, and myriads of flies conveyed infection from these sources. The sudden change from the hot

breeze to the cool nights favored enteric troubles. It was nearly impossible to obtain milk for the sick. These are all the faults that I can find with this camp. Our location at Huntsville, Ala., was an excellent one, being on a plateau, well drained, and supplied with excellent water piped from the city. Here we remained too long on one spot, not changing from September 1, when we arrived, to January 27, 1899, when we left, save for changing the line of tents occasionally. Our tentage was poor and leaky for the first few months. Our regiment was infected with typhoid fever at Chickamauga and Tampa, most of the cases not developing until we were at Fernandina and Huntsville.

To a large extent the disease was due to the personal carelessness of the men, who did not take proper care of themselves, eating and drinking what they should have left alone.

FIRST MAINE VOLUNTEER INFANTRY.

Third Brigade, Second Division, Third Army Corps.

In the May report Major Bradbury, in charge, makes the following statement:

This regiment was mustered into service May 13, 1898. It remained at Camp Powers until May 27, on which date the regiment left for Camp George H. Thomas, arriving there May 30 at 6 p. m. The health of the command was excellent throughout.

CONDENSED SICK REPORT FOR MAY.

Mean strength	1,002
Bronchitis	5
Coryza	2
Pneumonia	1
Accidents	2
Constipation	1
Indigestion	1
Total	12

In the June report Captain O'Neill, in charge, states:

I have the honor to report that the health of the First Maine Regiment during the month of June was excellent. The diseases most prevalent have been caused by changes in climate, diet, and water, affecting the intestinal canal. Only two contagious cases were reported during the month, one of measles and one of mumps.

CONDENSED SICK REPORT FOR JUNE.

Mean strength	1,047
Acute diarrhea	107
Enteritis	3
Dysentery	9
Undetermined fever	1
Other diseases	64
Total	184

It will be observed that the diagnosis of malaria does not occur in this regiment through May and June.

In the July report Captain O'Neill makes the following statement:

In general, I feel that the cause of our increased sick list has been due to the unfavorable weather which existed when we moved our camp and which has continued until the present time. We are endeavoring to overcome a great many of our diarrhea cases by having water boiled and by keeping the men off the ground at night by using board floors in their tents. There are many malarial cases and we are giving light doses of quinine to every man in the regiment twice a week.

CONDENSED SICK REPORT FOR JULY.

Mean strength	1,264
Intermittent malaria	24
Remittent malaria	31
Acute diarrhea	63
Typhoid fever	23
Dysentery	11
Undetermined fever	14
Other diseases	63
Total	229

CONDENSED SICK REPORT FOR AUGUST.

Mean strength	1,222
Intermittent malaria	62
Remittent malaria	55
Acute diarrhea	110
Typhoid fever	38
Dysentery	12
Undetermined fever	22
Other diseases	46
Total	345

This regiment left Chickamauga Park, Ga., August 23, and returned to Camp Powers, Me.

In the September report Doctor O'Neill makes the following statement:

While at Camp Thomas the general health of the regiment grew steadily worse, the prevailing diseases being malaria, typhoid fever, dysentery, and acute diarrhea. Since coming to our present camp malarial fevers are much less, but typhoids continue to appear. The record of cases not completed in this report and sent to hospital at Camp Thomas is in accordance with order 148.

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength not given.	
Intermittent malaria	41
Remittent malaria	26
Diarrhea	115
Dysentery	5
Typhoid fever	54
Enteritis	1
Other diseases	41
Total	283

There is no full report after that for September. However, in October Major O'Neill made the following statement:

The general condition of camp and men has improved since last month. Typhoid fever, malaria, and diarrhea have been the prevailing diseases.

The following is a list of the recognized and probable cases of typhoid fever in this regiment:

- No. 1. Company F: Diarrhea, June 25 to July 22.
- No. 2. Company D: Typhoid fever, June 27; sent to Leiter Hospital July 5.
- No. 3. Company M: Diarrhea, June 28; still sick in division hospital July 31.
- No. 4. Band: Typhoid fever, June 29; furloughed from Leiter Hospital August 16.
- No. 5. Company D: Remittent malaria, July 1 to August 9.
- No. 6. Company K: Remittent malaria, July 2; furloughed from division hospital August 22.

- No. 7. Company G: Typhoid fever, July 2; died at Leiter Hospital July 20.
- No. 8. Company K: Undetermined fever, July 3 to August 6.
- No. 9. Company B: Remittent malaria, July 4 to 19.
- No. 10. Company C: Typhoid fever, July 5 to 29.
- No. 11. Company C: Typhoid fever, July 5; furloughed August 22.
- No. 12. Company F: Typhoid fever, July 5 to August 16.
- No. 13. Company H: Typhoid fever, July 5; furloughed from Leiter Hospital August 10.
- No. 14. Company M: Dysentery, July 6 to 27.
- No. 15. Company A: Typhoid fever, July 6; furloughed from division hospital August 16.
- No. 16. Company K: Remittent malaria, July 7; still sick in hospital July 31.
- No. 17. Company H: Typhoid fever, July 9; furloughed from Fort McPherson August 24.
- No. 18. Company M: Typhoid fever, July 9; disposition not given.
- No. 19. Company F: Remittent malaria, July 10; still sick in hospital July 31.
- No. 20. Company C: Typhoid fever, July 10 to August 9.
- No. 21. Company D: Undetermined fever, July 12; furloughed from division hospital August 15; returned to duty September 14.
- No. 22. Company L: Typhoid fever, July 14; furloughed from Fort McPherson August 18.
- No. 23. Company K: Dysentery, July 14 to 28.
- No. 24. Company L: Intermittent malaria, July 14; still sick in division hospital July 31.
- No. 25. Company M: Intermittent malaria, July 14 to August 10.
- No. 26. Company H: Undetermined fever, July 15 to August 8.
- No. 27. Company L: Remittent malaria, July 15; furloughed from division hospital August 27.
- No. 28. Company I: Intermittent malaria, July 15; furloughed from division hospital August 1.
- No. 29. Company K: Remittent malaria, July 16; furloughed from Fort McPherson August 18. At Fort McPherson this case was diagnosed typhoid fever.
- No. 30. Company B: Diarrhea, July 16 to 26.
- No. 31. Company M: Typhoid fever, July 18 to September 1.
- No. 32. Company G: Typhoid fever, July 18 to September 21.
- No. 33. Company B: Undetermined fever, July 18 to September 21.
- No. 34. Company not given: Intermittent malaria, July 18 to August 3.
- No. 35. Company L: Typhoid fever, July 19; disposition not given.
- No. 36. Company E: Typhoid fever, July 19; furloughed from division hospital August 4.
- No. 37. Company F: Typhoid fever, July 20; died July 30.
- No. 38. Band: Intermittent malaria, July 20 to September 1.
- No. 39. Band: Typhoid fever, July 20 to August 16.
- No. 40. Company F: Typhoid fever, July 20; died in Leiter Hospital August 5.
- No. 41. Company A: Typhoid fever, July 21; died in division hospital August 3.
- No. 42. Company D: Intermittent malaria, July 21 to August 2.
- No. 43. Company C: Remittent malaria, July 21 to August 1.
- No. 44. Company L: Typhoid fever, July 21; furloughed August 11.
- No. 45. Company B: Typhoid fever, July 22; furloughed August 15.
- No. 46. Company L: Diarrhea, July 23; furloughed August 9.
- No. 47. Company E: Typhoid fever, July 24; sent to division hospital July 24; further disposition not given.
- No. 48. Company I: Enteritis, July 24 to September 21.
- No. 49. Company L: Typhoid fever, July 25 to September 21.
- No. 50. Company K: Diarrhea, July 25; furloughed August 8.
- No. 51. Company I: Remittent malaria, July 25; furloughed August 6.
- No. 52. Company D: Typhoid fever, July 26 to September 21.
- No. 53. Company A: Diarrhea, July 26; furloughed August 13.
- No. 54. Company F: Typhoid fever, July 27; sent to division hospital July 27; further disposition not known.
- No. 55. Company I: Undetermined fever, July 27; sent to division hospital July 27; further disposition not known.
- No. 56. Company A: Intermittent malaria, July 27 to August 24.
- No. 57. Company D: Intermittent malaria, July 27 to September 21.
- No. 58. Company D: Intermittent malaria, July 28 to September 21.
- No. 59. Company K: Typhoid fever, July 29 to September 21.
- No. 60. Company D: Remittent malaria, July 29; still sick September 30.
- No. 61. Company E: Intermittent malaria, July 29; still sick August 31.
- No. 62. Company B: Diarrhea, July 29; furloughed August 15.
- No. 63. Company G: Typhoid fever, July 29; died August 13.
- No. 64. Company G: Typhoid fever, July 29; disposition not given.
- No. 65. Company E: Diarrhea, July 31; furloughed August 9.
- No. 66. Company E: Typhoid fever, July 31; furloughed August 7.
- No. 67. Company D: Typhoid fever, July 31; furloughed August 15.
- No. 68. Company D: Typhoid fever, July 31; furloughed August 15.
- No. 69. Band: Diarrhea, July 31; furloughed August 21.
- No. 70. Company G: Dysentery, August 1; furloughed August 15.
- No. 71. Company G: Malaria, August 1; furloughed August 16.
- No. 72. Company B: Dysentery, August 1 to September 21.
- No. 73. Company K: Typhoid fever, August 2; furloughed August 15.
- No. 74. Company not given: Remittent malaria, August 2; furloughed August 15.
- No. 75. Company B: Typhoid fever, August 3 to September 21.
- No. 76. Company M: Typhoid fever, August 3; furloughed August 15.
- No. 77. Company A: Typhoid fever, August 3; died August 11.
- No. 78. Company D: Typhoid fever, August 3; still sick in hospital August 31.
- No. 79. Company M: Typhoid fever, August 3; furloughed August 16; returned to duty September 27.
- No. 80. Company K: Typhoid fever, August 5; furloughed August 22; returned to duty September 21.
- No. 81. Company K: Remittent malaria, August 5; furloughed August 20.
- No. 82. Company H: Intermittent malaria, August 5; furloughed August 28.
- No. 83. Company H: Diarrhea, August 5; furloughed August 15; returned to duty September 21.
- No. 84. Company F: Typhoid fever, August 5; furloughed August 15; returned to duty September 21.
- No. 85. Company B: Typhoid fever, August 5; furloughed August 22; returned to duty September 21.
- No. 86. Company H: Malaria, August 5; furloughed August 21.
- No. 87. Company H: Typhoid fever, August 6; died August 29.
- No. 88. Company H: Typhoid fever, August 6; died at Sternberg Hospital August 20.
- No. 89. Company M: Remittent malaria, August 6; furloughed August 15.
- No. 90. Company D: Intermittent malaria, August 6; furloughed August 15; died. Date of death not given. This man was furloughed, as stated above, August 15, but was found too sick to travel, and was returned to hospital on the same date.

No. 91. Company H: Typhoid fever, August 6; furloughed August 22; returned to duty September 21.

No. 92. Company M: Diarrhea, August 7; furloughed August 15.

No. 93. Company M: Diarrhea, August 7; furloughed August 15; returned to duty September 21.

No. 94. Company G: Intermittent malaria, August 7; furloughed August 15; returned to duty September 21.

No. 95. Company M: Typhoid fever, August 7; sent to Sternberg Hospital August 15.

No. 96. Company M: Diarrhea, August 7 to September 21.

No. 97. Company K: Diarrhea, August 8; furloughed August 25; returned to duty September 21.

No. 98. Company A: Typhoid fever, August 9; died August 29.

No. 99. Company I: Remittent malaria, August 9; furloughed August 15; returned to duty September 21.

No. 100. Company C: Typhoid fever, August 10; furloughed August 15; returned to duty September 21.

No. 101. Company D: Diarrhea, August 10; furloughed August 15.

No. 102. Company G: Intermittent malaria, August 10; furloughed August 21.

No. 103. Company B: Diarrhea, August 10; furloughed August 21.

No. 104. Company L: Diarrhea, August 10; furloughed August 22; returned to duty September 21.

No. 105. Company M: Typhoid fever, August 11; furloughed August 15; returned to duty September 21.

No. 106. Company M: Intermittent malaria, August 11 to September 21.

No. 107. Company K: Intermittent malaria, August 12; furloughed August 15; returned to duty September 21.

No. 108. Company M: Remittent malaria, August 12; furloughed August 15; returned to duty September 21.

No. 109. Company L: Typhoid fever, August 12; furloughed August 15.

No. 110. Company K: Typhoid fever, August 12; died September 5. This man reported for duty August 16, but was returned to hospital.

No. 111. Company F: Diarrhea, August 12; furloughed August 15; returned to duty September 21.

No. 112. Company L: Dysentery, August 12 to September 1.

No. 113. Company E: Remittent malaria, August 12 to September 27.

No. 114. Company B: Remittent malaria, August 13; furloughed August 22; returned to duty September 21.

No. 115. Company K: Remittent malaria, August 13; furloughed August 22; returned to duty September 21.

No. 116. Company A: Dysentery, August 13; furloughed August 15; returned to duty September 21.

No. 117. Company L: Remittent malaria, August 13; furloughed August 15; returned to duty September 21.

No. 118. Company A: Diarrhea, August 13; furloughed August 15.

No. 119. Company B: Intermittent malaria, August 13; furloughed August 15; returned to duty September 21.

No. 120. Company B: Intermittent malaria, August 13; furloughed August 24; returned to duty September 21.

No. 121. Company B: Intermittent malaria, August 13; furloughed August 15.

No. 122. Company B: Diarrhea, August 13; died September 1.

No. 123. Company B: Intermittent malaria, August 13 to September 21.

No. 124. Company not given: Typhoid fever, August 14; furloughed August 17.

No. 125. Company H: Typhoid fever, August 14; furloughed August 22; returned to duty September 21.

No. 126. Company H: Undetermined fever, August 14; sent to division hospital August 14; further information is not given.

No. 127. Company L: Intermittent malaria, August 14; furloughed August 22; returned to duty September 21.

No. 128. Company F: Undetermined fever, August 15; sent to division hospital August 15; further disposition not given.

No. 129. Company K: Undetermined fever, August 15; furloughed August 24.

No. 130. Company F: Typhoid fever, August 15; died August 17.

No. 131. Company M: Typhoid fever, August 15; died in Leiter Hospital August 18.

No. 132. Company H: Intermittent malaria, August 15; furloughed August 22; returned to duty September 21.

No. 133. Company M: Diarrhea, August 15 to September 5.

No. 134. Company C: Intermittent malaria, August 15 to September 1.

No. 135. Company L: Typhoid fever, August 16; furloughed August 22; returned to duty September 21.

No. 136. Company L: Undetermined fever, August 16; furloughed August 24.

No. 137. Company L: Undetermined fever, August 16; furloughed August 23.

No. 138. Company H: Intermittent malaria, August 16; furloughed August 22; returned to duty September 21.

No. 139. Company L: Typhoid fever, August 16; furloughed August 22; returned to duty September 21.

No. 140. Company H: Typhoid fever, August 16; died in Leiter Hospital August 21.

No. 141. Company G: Intermittent malaria, August 16; furloughed August 24; returned to duty September 21.

No. 142. Company E: Typhoid fever, August 16; furloughed August 27; returned to duty September 21.

No. 143. Company I: Typhoid fever, August 17; died August 24.

No. 144. Company B: Typhoid fever, August 17; sent to division hospital August 21; disposition not given.

No. 145. Company B: Diarrhea, August 19; sent to division hospital August 19; further disposition not given.

No. 146. Company B: Diarrhea, August 19; furloughed from division hospital August 23.

No. 147. Company H: Intermittent malaria, August 19; sent to division hospital August 19; further disposition not given.

No. 148. Company B: Undetermined fever, August 19; furloughed August 24.

No. 149. Company L: Undetermined fever, August 20; still sick in division hospital August 31.

No. 150. Company H: Undetermined fever, August 20; still sick in hospital September 30. In hospital this case was diagnosed typhoid fever.

No. 151. Company B: Diarrhea, August 29; furloughed August 29; died from typhoid fever at home September 6.

No. 152. Company B: Intermittent malaria, August 29 to September 21.

No. 153. Company H: Typhoid fever, August 29; furloughed September 25.

No. 154. Company I: Typhoid fever, August 29; furloughed September 13.

No. 155. Company E: Typhoid fever, August 29; furloughed September 25.

No. 156. Company E: Typhoid fever, August 29; furloughed September 25.

No. 157. Company F: Typhoid fever, August 29; died September 22.

No. 158. Company M: Typhoid fever, August 29; still sick at home September 30.

No. 159. Company D: Diarrhea, August 29 to September 25.

No. 160. Company C: Remittent malaria, August 29; furloughed September 6.

No. 161. Company K: Diarrhea, August 29; furloughed September 20.

No. 162. Company H: Typhoid fever, August 30; died September 7.

No. 163. Company M: Typhoid fever, August 30; died September 16.

No. 164. Company A: Typhoid fever, August 30; died September 21.

No. 165. Company D: Intermittent malaria, August 30 to September 21.

No. 166. Company A: Typhoid fever, August 31; still sick September 30.

No. 167. Company K: Typhoid fever, September 1; died September 26.

No. 168. Company C: Typhoid fever, September 1 to 21.

No. 169. Company I: Typhoid fever, September 1; died September 11.

No. 170. Band: Typhoid fever, September 1; furloughed September 8.

No. 171. Company H: Typhoid fever, September 1 to 25.

No. 172. Band: Typhoid fever, September 1; still sick September 30.

No. 173. Company D: Diarrhea, September 1 to 22.

No. 174. Company M: Diarrhea, September 1 to 27.

No. 175. Company D: Diarrhea, September 1 to 22.

No. 176. Company G: Diarrhea, September 1 to 21.

No. 177. Company L: Diarrhea, September 1 to 21.

No. 178. Company B: Typhoid fever, September 2; died September 9.

No. 179. Company B: Typhoid fever, September 2 to 25.

No. 180. Company B: Typhoid fever, September 2 to 21.

No. 181. Company B: Typhoid fever, September 2; died September 6.

No. 182. Company K: Typhoid fever, September 3 to 28.

No. 183. Company A: Typhoid fever, September 3 to 25.

No. 184. Company A: Typhoid fever, September 3 to 25.

No. 185. Company C: Diarrhea, September 5 to 21.

No. 186. Company F: Typhoid fever, September 7; still sick September 30.

No. 187. Company I: Typhoid fever, September 7; still sick September 30.

No. 188. Company E: Diarrhea, September 7 to 21.

SUMMARY.

Assembled at Camp Powers, Me., during April and May, 1898.

Mustered into United States service May 13, 1898.

Arrived at Chickamauga Park, Ga., May 30, 1898.

Strength on arrival, 1,002.

Date of first case of probable typhoid fever, June 25, 1898.

Date of first case of recognized typhoid fever, June 27, 1898.

Left Chickamauga Park, Ga., August 23, 1898.

Strength on departure, 1,286.

Number of probable cases of typhoid fever developed at Chickamauga..... 150

Went from Chickamauga Park, Ga., to Camp Powers, Me.

Number of probable cases of typhoid fever developed after leaving Chickamauga..... 38

Total number of cases of probable typhoid fever developed in the First Maine Volunteer Infantry from May to September, 1898..... 188

These 188 cases were diagnosed as follows:

Typhoid fever.....	88
Undetermined fever.....	12
Malaria.....	49
Diarrhea.....	32
Dysentery.....	6
Enteritis.....	1

Total..... 188

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Annis, William L.....	Pvt., L.	1898. Sept. 14	M. G. Hospital, Portland, Me.	Typhoid.
Bartlett, F. T.....	Capt., D.	July 3	Camp Thomas, Ga.....	(Typhoid); acute dysentery.
Braum, Jesse C.....	Pvt., F.	July 30do.....	Typhoid.
Broughton, G. S.....	Pvt., A.	Aug. 3do.....	Do.
Brophy, James.....	Pvt., B.	Sept. 6do.....	Do.
Bucklin, H. E.....	Pvt., H.	Sept. 13	Warren, Me.....	Do.
Calderwood, W. L.....	Pvt., F.	Sept. 15	Portland, Me.....	Typhomalaria.
Carpenter, W. A.....	Pvt., H.	Sept. 2do.....	Typhoid.
Clark, Luther A.....	Corpl., K.	Aug. 13do.....	Do.
Clinton, F. J.....	Pvt., K.	Sept. 1	M. G. Hospital, Portland, Me.	Do.
Cummings, Guy.....	Pvt., F.	Aug. 31	Belgrade, Me.....	Do.
Desjardins, W. R.....	Pvt., C.	Sept. 18	Lewiston, Me.....	Do.
Dyer, Arthur W.....	Pvt., B.	Sept. 6	Augusta, Me.....	Do.
Freeman, C. P.....	Pvt., M.	Sept. 3	Maine Eye and Ear Infirmary, Portland, Me.	Do.
Gibbs, Roscoe L.....	Pvt., I.	Sept. 11	City Hospital, Augusta, Me.	Do.
Grover, I. W.....	Pvt., B.	Sept. 10	Augusta, Me.....	Do.
Hackett, E. A.....	Pvt., H.	Aug. 20	Field Hospital, Chickamauga, Ga.	Do.
Haggerty, James F....	Pvt., I.	Aug. 24	Enroute, near Sumter, S. C.	Do.
Heal, Ivra.....	Pvt., H.	Aug. 28	Portland, Me.....	Do.
Heaphy, A. F.....	Pvt., L.	Aug. 23do.....	Do.
Heaphy, James M.....	Pvt., L.	Sept. 12	Eye and Ear Infirmary, Portland, Me.	Do.
Higgins, P. E.....	Sgt., A.	Aug. 24	Portland, Me.....	Do.
Kateon, Ernest E.....	Pvt., E.	Sept. 9	Eye and Ear Infirmary, Portland, Me.	Do.
Lamson, Harold.....	Pvt., D.	Oct. 2	Augusta, Me.....	Do.
Leslie, James L.....	Corpl., K.	Aug. 4	Camp Thomas, Ga.....	Typhoid paralysis.
Libby, Carl W.....	Corpl., A.	Aug. 10	Chattanooga, Tenn.....	Typhoid.
McDougall, C. F.....	Pvt., F.	Aug. 18	Second Division hospital, Third Army Corps, Chickamauga, Ga.	(Typhoid); acute dysentery.
McGilvary, Alex.....	Pvt., H.	Aug. 21	Leiter Hospital, Ga.....	Typhoid.
Marrow, Chas. S.....	Pvt., M.	Aug. 18	Camp Thomas, Ga.....	Do.
Morse, Arthur B.....	Pvt., B.	Aug. 21	Jersey City, N. J.....	Do.
Murren, Henry J.....	Pvt., E.	Nov. 1	Portland, Me.....	Do.
Nelson, Benj.....	Corpl., A.	Aug. 28do.....	Do.
Normandin, Eugene.....	Pvt., G.	Aug. 13	Camp Thomas, Ga.....	Do.
Painchaud, E.....	Band.	Sept. 23	Biddeford, Me.....	Do.
Perkins, C. E.....	Pvt., G.	July 20	Chickamauga, Ga.....	Do.
Poore, W. W.....	Corpl., F.	Aug. 5do.....	Do.
Scott, Chas. C.....	Sgt., D.	Aug. 31	Portland, Me.....	Do.
Scribner, R. A.....	Pvt., B.	Aug. 28	M. G. Hospital, Portland, Me.	Do.
Slater, George.....	Pvt., M.	Sept. 10	City Hospital, Augusta, Me.	Do.
Smith, Ardacton.....	Pvt., C.	Nov. 16	Augusta, Me.....	Do.
Thibbetts, Geo. W.....	Pvt., C.	Aug. 22	Auburn, Me.....	Do.
Tripp, E. C.....	Pvt., F.	Sept. 22	Augusta, Me.....	Typhoid malaria.
Ulmar, Ralph A.....	Major.	Sept. 4	Rockland, Me.....	Do.
Wyman, William W.....	Pvt., K.	Sept. 22	Augusta, Me.....	Typhoid.
Young, Geo. W.....	Pvt., H.	Sept. 5	Rockland, Me.....	Do.

Total deaths.....	45
Deaths due to typhoid fever.....	45

Percentage of deaths among probable cases of typhoid fever (188), 23.93.

Percentage of deaths among recognized cases of typhoid fever (88), 51.13.

FIFTY-SECOND IOWA VOLUNTEER INFANTRY.

Third Brigade, Second Division, Third Army Corps.

This regiment was mustered into service at Camp McKinley, Des Moines, Iowa, May 25, 1898. It left Camp McKinley May 28, and arrived at Chickamauga Park, Ga., May 31. The first report covers the period from May 25 to May 31, inclusive. Apparently the regiment did not contain more than half its full strength at this time, as the mean strength is given at 572.

Only four cases are included in this report, and none of these could have any possible connection with typhoid fever. The regiment was in charge of Maj. A. C. Bergen.

Acting Surgeon Knott signs the June report and makes the following statement:

The prevalent disorder during the month has been acute diarrhea, occasioned not so much by the change of climate, water, etc., as by the general disposition on the part of the men to buy from hucksters, and eat all kinds of truck, such as overripe fruit, fried chicken, milk which was frequently beginning to ferment. Another cause was carelessness in regard to clothing, sitting or standing around in the air during the evening when it turns much cooler than during the day, with no blouse on and often only an undershirt and drawers. An earnest attempt has been made to eliminate these causes, by ordering the men to discontinue the above-named habits, and also by ordering the wagons from the grounds. Muscular rheumatism has been quite prevalent, due in all probability to the marked change in temperature between day and night and the dampness which prevails after sundown. The entire command has been vaccinated, no serious sore arms resulting in any case. The systemic disturbance in probably 75 was sufficient to demand that the command be excused from duty for two or three days.

CONDENSED SICK REPORT FOR JUNE.

Mean strength	1,031
Acute diarrhea	153
Intermittent malaria	6
Dysentery	3
Typhoid fever	2
Other diseases	89
Total	253

The recognized cases of typhoid fever were privates in Companies A and B.

In the July report Surgeon Knott makes the following statement:

Typhoid fever has been quite prevalent for the past month in this regiment, there having been about fourteen cases due to drinking contaminated spring water from surface springs, contrary to the order requiring that all water for drinking or bathing should be boiled. Strenuous efforts have been made to compel the boiling of all water used. The patients have been sent to division hospital at once, and stools have been disinfected. Malaria has been more in evidence than hitherto, owing to almost daily rains. It has been of a mild type. Diarrhea continues, but not so frequently as at last report, nor does it seem so stubborn in yielding to treatment.

CONDENSED SICK REPORT FOR JULY.

Mean strength	1,327
Intermittent malaria	13
Remittent malaria	1
Acute diarrhea	291
Enteritis	11
Dysentery	3
Typhoid fever	20
Other diseases	70
Total	409

In the August report Major Bergen makes the following statement:

The health of the regiment was good until the 13th instant, when there were 41 new cases, with 20 to 40 additional daily, about one-half being diagnosed as intermittent malarial fever, many of which subsequently developed into severe cases of typhoid fever. These cases of so-called malarial fever were not typical cases of fever of any kind—were characterized by high evening tempera-

ture from the beginning. The cause is obscure. Certainly it can not be attributed to any one condition. Those who persistently drank nothing but boiled water, or coffee, or tea, did not escape. There were no swamps or mosquitoes in the vicinity, but millions of flies. The camp was kept as clean as policing would do it. The sinks, while not ideal, were kept in very fair condition. The rations were good and abundant, the bread being good and baked fresh every day. Fresh meat, issued seven days out of ten, was of the finest quality, transported in refrigerator cars and in good condition when issued. In my opinion, the long continued camping in close quarters on one spot, the extreme monotony of life, the hot days followed by damp and often cool nights, disappointment caused by the ending of hostilities before the opportunity of seeing active service, were some of the factors leading to the sickly results. Pursuant to Special Order 80, Headquarters George H. Thomas Camp, dated August 19, 1898, the regiment left Chickamauga Park en route to Camp McKinley, Des Moines, Iowa, August 28, reaching destination August 30. Prior to this many men had gone to their homes on sick furloughs and about 180 were sent home on special hospital trains. Of the sick who accompanied the regiment, 34 were sent to Cottage Hospital, in the city of Des Moines, and 54 have been received in the hospital at Camp McKinley.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength	1,295
Intermittent malaria	377
Remittent malaria	22
Acute diarrhea	188
Enteritis	5
Dysentery	7
Typhoid fever	52
Other diseases	71
Total	722

In the September report Major Bergen states:

The Fifty-second Regiment was in Camp McKinley for only about ten days during this month, the men being sent to their homes pursuant to the provisions of General Orders, No. 130, War Department, Adjutant-General's Office, current series. Those sick but able to travel were given sick furloughs. Those too sick to travel were cared for in Camp McKinley Hospital, which was established in the commodious and well-appointed building known as the Hyde Park Sanitarium, located at a distance of about one-half mile from Camp McKinley. Of the 300 cases covered by this report 119 have been diagnosed as typhoid fever. In some of these cases the disease, and in others the germs, were brought from Chickamauga Park, Ga. Many of the cases originally diagnosed as malarial fever or acute diarrhea subsequently developed into cases of typhoid fever. No company or regimental records have been kept since the 8th of the month. Many cases of sickness have developed among the men at their homes, and some have died, of which, in the absence of records, it is impossible to obtain correct data. Most of the cases of typhoid fever treated in the hospital have been of severe type, with a highly nervous condition prevailing. The mortality has been about 6 per cent.

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength	1,282
Intermittent malaria	122
Remittent malaria	4
Acute diarrhea	30
Dysentery	1
Enteritis	1
Typhoid fever	119
Other diseases	23
Total	300

The following is a list of the recognized and probable cases of typhoid fever in this regiment:

- No. 1. Company A: Typhoid fever, June 8; furloughed July 11.
- No. 2. Company F: Typhoid fever, June 26; furloughed August 2.
- No. 3. Company G: Diarrhea, July 1; still sick July 31.
- No. 4. No company: Enteritis, July 1 to August 29.
- No. 5. Company L: Enteritis, July 1 to 24.
- No. 6. Company D: Typhoid fever, July 4; died July 9.
- No. 7. Company D: Enteritis, July 7 to 20.
- No. 8. Company M: Typhoid fever, July 9 to August 17.
- No. 9. Company A: Typhoid fever, July 9; sent to Fort McPherson July 25.
- No. 10. Company G: Enteritis, July 10; died August 4.
- No. 11. Company E: Diarrhea, July 11; still sick July 31.
- No. 12. Company E: Diarrhea, July 11; furloughed August 1.
- No. 13. Company F: Typhoid fever, July 14 to August 7. This case was first diagnosed diarrhea.
- No. 14. Company I: Enteritis, July 14 to 30.
- No. 15. Company B: Diarrhea, July 15 to August 17. In the hospital this case was diagnosed as undetermined fever.
- No. 16. Company K: Typhoid fever, July 15; furloughed from Leiter Hospital August 21.
- No. 17. Company F: Typhoid fever, July 15; sent to Fort McPherson July 25; died July 29.
- No. 18. Company B: Typhoid fever, July 15; sent to Fort McPherson July 25.
- No. 19. Company M: Typhoid fever, July 17; sent to Fort McPherson July 25.
- No. 20. Company M: Typhoid fever, July 17; sent to Fort McPherson July 25.
- No. 21. Company M: Typhoid fever, July 17; sent to Fort McPherson July 25.
- No. 22. Company F: Typhoid fever, July 18; furloughed July 21.
- No. 23. Company B: Diarrhea, July 18 to September 13.
- No. 24. Company G: Typhoid fever, July 18; furloughed from Leiter Hospital August 24.
- No. 25. Company K: Typhoid fever, July 19; furloughed from Leiter Hospital September 10.
- No. 26. Company A: Diarrhea, July 19 to August 18. In the division hospital this case was diagnosed typhoid fever.
- No. 27. Company L: Diarrhea, July 20 to August 4.
- No. 28. Company A: Typhoid fever, July 20; disposition not given.
- No. 29. Company A: Typhoid fever, July 20; furloughed from Leiter Hospital September 7.
- No. 30. Company I: Typhoid fever, July 22 to September 5.
- No. 31. Company K: Typhoid fever, July 23; sent to Fort McPherson July 25; died July 25.
- No. 32. Company B: Diarrhea, July 24; furloughed August 2.
- No. 33. No company: Typhoid fever, July 24; died at Leiter Hospital August 7.
- No. 34. Company I: Typhoid fever, July 24; furloughed from division hospital August 8. This and many other cases in this regiment are marked duty when they were furloughed.
- No. 35. Company D: Diarrhea, July 24; furloughed August 18.
- No. 36. Company C: Without date or diagnosis; sent to division hospital July 25. Here the disease was diagnosed typhoid fever. The further disposition of this patient is not given.
- No. 37. Company not given: Typhoid fever, July 26; furloughed August 8.
- No. 38. Company H: Diarrhea, July 26; furloughed September 3. In the hospital this case was diagnosed typhoid fever.
- No. 39. Company B: Diarrhea, July 28 to August 29.
- No. 40. Company L: Typhoid fever, July 28; furloughed August 4.
- No. 41. Company G: Intermittent malaria, July 29 to September 17.

- No. 42. Company C: Typhoid fever, July 29 to September 15.
- No. 43. Company F: Intermittent malaria, July 29 to September 16. In the hospital this case was diagnosed typhoid fever.
- No. 44. Company F: Typhoid fever, July 30 to September 5.
- No. 45. Company K: Typhoid fever, August 1; furloughed September 11.
- No. 46. Company G: Diarrhea, August 3 to September 13.
- No. 47. Company H: Diarrhea, August 3 to September 13.
- No. 48. Company H: Diarrhea, August 3 to September 12. In the hospital this case was diagnosed typhoid fever.
- No. 49. Company L: Typhoid fever, August 3; furloughed August 19.
- No. 50. Company F: Without date or diagnosis; sent to division hospital August 4. Here the disease was diagnosed typhoid fever, and the patient was furloughed August 18.
- No. 51. Company B: Intermittent malaria, August 4 to September 15.
- No. 52. Company F: Typhoid fever, August 4; furloughed August 28.
- No. 53. Company I: Remittent malaria, August 4 to September 17.
- No. 54. Company I: Typhoid fever, August 4; died August 14. This case was first diagnosed diarrhea.
- No. 55. Company I: Typhoid fever, August 4 to September 6.
- No. 56. Company G: Diarrhea, August 4; still sick September 30.
- No. 57. Company D: Typhoid fever, August 5; disposition not given.
- No. 58. Company M: Without date or diagnosis; sent to Sternberg Hospital August 5; died August 18.
- No. 59. Company H: Dysentery, August 5 to September 16.
- No. 60. Company C: Without date or diagnosis; sent to Sternberg Hospital August 6. Here the disease was diagnosed typhoid fever, and the patient was furloughed August 30.
- No. 61. Company G: Typhoid fever, August 6; died September 1.
- No. 62. Company F: Typhoid fever, August 6; died August 19.
- No. 63. Company K: Remittent malaria, August 7 to September 17.
- No. 64. Company K: Without date or diagnosis; sent to division hospital August 7. Here the disease was diagnosed typhoid fever, and the patient died. The date of death is not given.

No. 221. Company K: Intermittent malaria, August 21 to September 24.

No. 222. Company M: Typhoid fever, August 21; still sick September 30.

No. 223. Company E: Typhoid fever, August 22; still sick September 30.

No. 224. Company F: Typhoid fever, August 23; furloughed August 28.

No. 225. Company I: Remittent malaria, August 23 to September 30.

No. 226. Company C: Typhoid fever, August 24 to September 30.
No. 227. Company C: Typhoid fever, August 24 to September 29.
No. 228. Company G: Intermittent malaria, August 24 to September 24.
No. 229. Company F: Intermittent malaria, August 24 to September 30.
No. 230. Company B: Intermittent malaria, August 24 to September 23. In the hospital this case was diagnosed typhoid fever.
No. 231. Company I: Remittent malaria, August 24 to September 24.
No. 232. Company C: Intermittent malaria, August 25 to September 30.
No. 233. Company L: Typhoid fever, August 25; still sick September 30.
No. 234. Company E: Typhoid fever, August 25; still sick August 30.
No. 235. Company I: Typhoid fever, August 25; still sick September 30.
No. 236. Company B: Typhoid fever, August 25 to September 19.
No. 237. Company K: Intermittent malaria, August 25 to September 24.
No. 238. Company D: Malaria, August 25 to September 30.
No. 239. Company B: Typhoid fever, August 26; still sick September 30.
No. 240. Company L: Typhoid fever, August 26; still sick September 30.
No. 241. Company K: Typhoid fever, August 26; still sick September 30.
No. 242. Company I: Typhoid fever, August 26; still sick September 30.
No. 243. Company C: Typhoid fever, August 26; still sick September 30.
No. 244. Company D: Typhoid fever, August 26; still sick September 30.
No. 245. Company I: Without date or diagnosis; sent to division hospital August 27. Here the disease was diagnosed typhoid fever. The further disposition of this patient is not given.
No. 246. Company M: Typhoid fever, August 27; still sick September 30.
No. 247. Company A: Without date or diagnosis; sent to division hospital August 27. Here the disease was diagnosed as undetermined fever, and the patient had not returned to duty September 30.
No. 248. Company L: Diarrhea, August 27 to September 30.
No. 249. Company B: Typhoid fever, August 27 to September 30.
No. 250. Company M: Intermittent malaria, August 27 to September 26.
No. 251. Company K: Diarrhea, August 28 to September 19.
No. 252. Company I: Typhoid fever, August 28; still sick September 30.
No. 253. Company K: Typhoid fever, August 28; still sick September 30.
No. 254. Company H: Intermittent malaria, August 28 to September 27.
No. 255. Company I: Typhoid fever, August 28; still sick September 30.
No. 256. Company L: Diarrhea, August 28 to September 27.
No. 257. Company K: Typhoid fever, August 28; still sick September 30.
No. 258. Company F: Typhoid fever, August 30; still sick September 30.
No. 259. Company D: Typhoid fever, August 30; died September 23.
No. 260. Company E: Typhoid fever, August 30; still sick September 30.
No. 261. Company D: Intermittent malaria, August 30; still sick September 30.

No. 262. Company B: Typhoid fever, August 30; still sick September 30.
No. 263. Company A: Typhoid fever, August 30; died September 5.
No. 264. Company C: Typhoid fever, August 30; still sick September 30.
No. 265. Company H: Typhoid fever, August 30 to September 30.
No. 266. Company L: Typhoid fever, August 30; still sick September 30.
No. 267. Company F: Typhoid fever, August 30; still sick September 30. It is more than probable that many of these cases with the initial date on August 30 really have an earlier initial date. This case illustrates this point. On the regimental record it appears that this man was sent to division hospital August 30; on the hospital record it appears that he was received on August 28.
No. 268. Company G: Intermittent malaria, August 30 to September 30.
No. 269. Company I: Typhoid fever, August 30; still sick September 30.
No. 270. Company H: Typhoid fever, August 30; still sick September 30.
No. 271. Company L: Typhoid fever, August 30; still sick September 30.
No. 272. Company I: Typhoid fever, August 30; still sick September 30.
No. 273. Company B: Intermittent malaria, August 30 to September 30.
No. 274. Company I: Typhoid fever, August 30; still sick September 30.
No. 275. Company F: Typhoid fever, August 30; still sick September 30.
No. 276. Company K: Typhoid fever, August 30; still sick September 30.
No. 277. Company F: Typhoid fever, August 30; still sick September 30.
No. 278. Company M: Typhoid fever, August 30; still sick September 30.
No. 279. Company G: Intermittent malaria, August 30 to September 30.
No. 280. Company G: Intermittent malaria, August 30 to September 30.
No. 281. Company H: Intermittent malaria, August 30 to September 29.
No. 282. Company G: Intermittent malaria, August 30 to September 30.
No. 283. Company L: Intermittent malaria, August 30 to September 30.
No. 284. Company F: Typhoid fever, August 30; died September 2.
No. 285. Company M: Typhoid fever, August 30 to September 30.
No. 286. Company D: Intermittent malaria, August 30; still sick September 30.
No. 287. Company H: Intermittent malaria, August 30 to September 27.
No. 288. Company F: Typhoid fever, August 30; still sick September 30. On the hospital record it appears that this man was sent to division hospital August 17.
No. 289. Company E: Typhoid fever, August 30; still sick September 30.
No. 290. Company H: Typhoid fever, August 30; still sick September 30.
No. 291. Company E: Intermittent malaria, August 30; still sick September 30.
No. 292. Company F: Typhoid fever, August 30; still sick September 30. On the hospital record it appears that this man was

sent to division hospital August 17, and was furloughed August 28.

No. 293. Company H: Typhoid fever, August 30; still sick September 30.

No. 294. Company G: Intermittent malaria, August 30 to September 29.

No. 295. Company H: Intermittent malaria, August 30 to September 29.

No. 296. Company H: Intermittent malaria, August 30 to September 29.

No. 297. Company L: Intermittent malaria, August 30 to September 29.

No. 298. Company K: Typhoid fever, August 30; still sick September 30.

No. 299. Company I: Typhoid fever, August 30; still sick September 30.

No. 300. Company I: Typhoid fever, August 30; still sick September 30. On the hospital record it appears that this man was furloughed August 28.

No. 301. Company L: Typhoid fever, August 31; still sick September 30.

No. 302. Company L: Typhoid fever, August 31; still sick September 30.

No. 303. Company C: Intermittent malaria, August 31 to September 30.

No. 304. Company G: Typhoid fever, August 31; still sick September 30.

No. 305. Company H: Intermittent malaria, August 31 to September 30.

No. 306. Company F: Typhoid fever, August 31 to September 30.

No. 307. Company M: Typhoid fever, August 31; still sick September 30.

No. 308. Company H: Intermittent malaria, August 31 to September 29. In the hospital this case was diagnosed typhoid fever.

No. 309. Company L: Intermittent malaria, August 31 to September 30.

No. 310. Company H: Intermittent malaria, August 31 to September 30.

No. 311. Company L: Typhoid fever, August 31; still sick September 30.

No. 312. Company L: Typhoid fever, August 31; still sick September 30.

No. 313. Company F: Typhoid fever, August 31 to September 30.

No. 314. Company D: Typhoid fever, September 1; still sick September 30.

No. 315. Company A: Typhoid fever, September 1; still sick September 30.

No. 316. Company E: Typhoid fever, September 2; still sick September 30.

No. 317. Company L: Intermittent malaria, September 2; still sick September 30.

No. 318. Company G: Typhoid fever, September 2; still sick September 30.

No. 319. Company L: Intermittent malaria, September 2; still sick September 30.

No. 320. Company L: Intermittent malaria, September 2; still sick September 30.

No. 321. Company E: Typhoid fever, September 3; still sick September 30.

No. 322. Company D: Typhoid fever, September 3; still sick September 30.

No. 323. Company E: Typhoid fever, September 3; still sick September 30.

No. 324. Company D: Typhoid fever, September 3; died September 25.

No. 325. Company E: Intermittent malaria, September 3; still sick September 30.

No. 326. Company I: Typhoid fever, September 4; still sick September 30.

No. 327. Company B: Intermittent malaria, September 4; still sick September 30.

No. 328. Company B: Malaria, September 4; still sick September 30.

No. 329. Company C: Typhoid fever, September 4; still sick September 30.

No. 330. Company I: Typhoid fever, September 5; still sick September 30.

No. 331. Company H: Typhoid fever, September 5; still sick September 30.

No. 332. Company H: Typhoid fever, September 5 to 30.

No. 333. Company B: Intermittent malaria, September 6; still sick September 30.

No. 334. Company G: Typhoid fever, September 6; still sick September 30.

No. 335. Company H: Typhoid fever, September 6; still sick September 30.

No. 336. Company L: Typhoid fever, September 7; still sick September 30.

No. 337. Company L: Typhoid fever, September 7; still sick September 30.

No. 338. Company L: Intermittent malaria, September 7; still sick September 30.

No. 339. Company K: Typhoid fever, September 8; still sick September 30.

No. 340. Company I: Typhoid fever, September 9; still sick September 30.

No. 341. Company I: Typhoid fever, September 9; still sick September 30.

No. 342. Company E: Typhoid fever, September 9; still sick September 30.

No. 343. Company I: Typhoid fever, September 13; still sick September 30.

No. 344. Company M: Typhoid fever, September 16; died September 29.

No. 345. Company D: Typhoid fever, September 23; still sick September 30.

SUMMARY.

Assembled at Camp McKinley near Des Moines, Iowa, April 26, 1898.

Mustered into United States service May 25, 1898.

Arrived at Chickamauga Park, Ga., May 31, 1898.

Strength on arrival, 572.

Date of first case of probable typhoid fever June 8, 1898.

Date of first case of recognized typhoid fever June 8, 1898.

Left Chickamauga Park, Ga., August 28, 1898.

Strength on departure, 1,304.

Number of cases of probable typhoid fever developed at Chickamauga 257

Went from Chickamauga Park, Ga., to Des Moines, Iowa.

Number of cases of probable typhoid fever developed after leaving Chickamauga 88

Total number of cases of probable typhoid fever developed in the Fifty-second Iowa Volunteer Infantry from May to September, 1898..... 345

These 345 cases were diagnosed as follows:

Typhoid fever.....	184
Malaria.....	112
Diarrhea.....	40
Enteritis.....	5
Dysentery.....	1
Indigestion.....	2
Undetermined fever.....	1

Total 345

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
1898.				
Abrams, Harry S.	Pvt., H.	Aug. 21	Chickamauga, Ga.	Typhoid.
Adams, Robert a.	Pvt., M.	Sept. 7	St. Luke's Hospital, Chicago, Ill.	Do.
Bandfield, W.	Pvt., I.	Sept. 17	Boone, Iowa.	Do.
Barkhufl, Gus S.	Pvt., C.	Aug. 22	Camp Thomas, Ga.	Do.
Brophy, John D.	Pvt., D.	Sept. 23	Camp McKinley, Iowa	Do.
Brown, Chas. F.	Sgt., G.	Sept. 8	Fort Dodge, Iowa.	Do.
Buck, Seymour W.	Pvt., G.	Aug. 4	Camp Thomas, Ga.	Do.
Bunger, Bert.	Pvt., G.	Sept. 2	Fort Dodge, Iowa.	Do.
Carroll, Mathew F.	Pvt., M.	Sept. 29	Camp McKinley, Iowa	Do.
Clock, Ned L.	Pvt., D.	Aug. 5	Chattanooga, Tenn.	Do.
Converse, Roy C.	Pvt., M.	Aug. 7	Chickamauga, Ga.	(Typhoid); pernicious malaria.
Cronan, Fred N.	Pvt., F.	Aug. 27	Algona, Iowa.	Typhoid.
Cronin, John W.	Pvt., A.	Sept. 5	Des Moines, Iowa.	Do.
Demo, William O.	Pvt., D.	Sept. 23	Camp McKinley, Iowa	Do.
Duncan, Chas. R.	Corpl., K.	Sept. 9	Camp Thomas, Ga.	Do.
Dutton, Burton R.	Corpl., C.	Sept. 7	Jewell, Iowa.	Do.
Fallrich, Ben W.	Pvt., E.	Sept. 11	Des Moines, Iowa.	Do.
French, John W.	Sgt., D.	July 9	Camp Thomas, Ga.	Do.
Galloway, John A.	Pvt., B.	Oct. 14	Centerville, Iowa.	Do.
Grout, Chas. F.	2d Lt., K.	Sept. 13	Emmetsburg, Iowa.	Do.
Hamilton, J. A.	Pvt., H.	Oct. 4	Sioux City, Iowa.	Do.
Lane, C. E.	Pvt., F.	Sept. 2	Camp McKinley, Iowa	(Typhoid); malarial fever and heart failure.
McDowell, Clinton	Pvt., B.	Aug. 22	Typhoid.
Mowery, William	Pvt., D.	Sept. 2	Camp McKinley, Iowa	Do.
Munn, Frank C.	Corpl., B	Sept. 2	Sternberg Hospital, Chickamauga, Ga.	Do.
Nelson, Eddie E.	Pvt., I.	Aug. 14	Camp Thomas, Ga.	Malarial fever.
Ohge, William A.	Pvt., I.	Sept. 30	Boone, Iowa.	Typhoid.
Packloff, Guy	Pvt., C.	Aug. 24	Sternberg Hospital, Chickamauga, Ga.	Do.
Rifenborg, J. W.	Corpl., G	Aug. 26	Fort Dodge, Iowa.	Do.
Saul, Richard H.	Pvt., G.	Sept. 2	Do.
Skinner, Linn R.	Sgt., band	Aug. 25	Chattanooga, Tenn.	Do.
Stahl, William E.	Wag., F.	Aug. 9	Camp Thomas, Ga.	Do.
Stevens, James E.	Pvt., C.	Aug. 28	Jefferson, Iowa.	Do.
Tracey, William J.	Pvt., E.	Sept. 19	Larchwood, Iowa.	Do.
Watkins, Harry P.	Pvt., M.	Aug. 19	Chickamauga, Ga.	Do.
Winkel, Edgar J.	Pvt., F.	July 29	Fort McPherson, Ga.	Do.
Wilson, Guy M.	Mus., K.	July 25	Do.

a The cause of death in this case was not known until after the percentages had been figured out.

Total deaths..... 37
Deaths due to typhoid fever..... 36

Percentage of deaths among probable cases of typhoid fever (345) 10.43.
Percentage of deaths among recognized cases of typhoid fever (184) 19.56.

COMMUNICATIONS FROM THE SURGEONS OF THE FIFTY-SECOND IOWA VOLUNTEER INFANTRY.

Medical officers.

Andrew C. Bergen, major and surgeon, Sioux City, Iowa.
Van Buren Knott, lieutenant and assistant surgeon, Sioux City, Iowa.
Frank J. Murphy, lieutenant and assistant surgeon, Sioux City, Iowa.

Major Bergen makes the following statement:

This regiment was originally the Fourth Iowa National Guard, and rendezvoused at Camp McKinley, Des Moines, Iowa, on the 26th day of April, 1898, twenty-nine days prior to being mustered into the United States service. Camp McKinley occupied the State fair grounds, the buildings of which were utilized to shelter the four regiments which entered the volunteer service. The water supply of this camp was obtained from a well on the grounds and distributed through pipes by means of a steam pump. It was of good quality.

The sinks were cleaned by scavengers every night, the night soil being hauled in closed vessels and disposed of outside of the camp. Outside of a few mild cases of measles, there was no sickness to speak of at this camp. The general health of the regiment was excellent when it reached Chickamauga Park, Ga.

The regiment in Camp Thomas was located on the southwestern angle formed by the intersection of the Jay's Mill road and the main water-supply pipe, running directly north, about one-half mile northeast of the Vinyard House. There was quite an elevation in the center of the camp, from which the ground sloped three ways. East of the camp the ground sloped upward to a ridge about 400 yards distant. The surface was quite rocky, with large-sized trees, enough to afford considerable shade.

The soil was a hard and nonporous clay, and, when there was enough of it in which to dig a pit, was thrown out in chunks. The digging of sinks for the men was necessarily a difficult task, and their proper care and disinfection was a still greater one. No form of disinfectant was issued to the regiment in any quantity. I think that 1 barrel of quick lime was issued to it during the entire stay at Camp Thomas. Various methods of disinfection were tried, such as burning straw or hay refuse from the corrals in the sinks, on the theory that the heat would destroy flies and their larvae and the ashes would aid in disinfection; but little, if any, effects could be noticed, and the practice was soon abandoned. The dust swept from the camp was the only dirt available for covering the contents of the sinks. Nothing tried seemed to prevent or hinder the multiplication and development of the larvae of the flies in these sinks, where they held high carnival until their wings developed and they could fly over to the mess tables with a good supply of typhoid and other germs. The water used came mostly from the Chickamauga Creek through the supply pipe, and was not by any means ideal, as it was always warm, sometimes hot, and generally muddy. That it contained disease germs in any quantity seems doubtful. Everybody was advised, instructed, and ordered to drink no water that had not been boiled; but the facilities for both boiling and cooling the water were inadequate, rendering the enforcement of such orders difficult. This camp was occupied continuously without striking tents for about ten weeks. Finally a move was made to an open space in the vicinity.

FIRST MISSISSIPPI VOLUNTEER INFANTRY.

Third Brigade, Second Division, Third Army Corps.

This regiment was mustered into service at Camp Patrick Henry, Jackson, Miss., May 26, 1898. It left Jackson May 30, and arrived at Chickamauga Park, Ga., May 31.

Maj. R. L. Turner was in charge. He states:

Owing to the crude condition of the regimental organization, I have been unable to make a report. Our organization was not completed until the last of May. No cases requiring to be excused from duty occurred between dates of muster-in and arrival at Camp Thomas, Chickamauga Park.

The mean strength of the regiment was 995.

The June report is signed by Captain Kittrell, who makes the following statement:

The prevailing diseases have been malarial fever, both remittent and intermittent, measles, acute diarrhea, and some cases of typhoid fever. The cause of the malaria was moving the command from the very low altitude of southern Mississippi to the comparative high altitude of Camp Thomas. The preventative measures adopted have been the free prophylactic use of quinine, each man receiving from 3 to 5 grains daily. All cases of measles have been sent to the isolation ward of the division hospital. The source of the typhoid infection has as yet been undetermined. The measures for the prevention of typhoid fever have been, first, a complete change of water supply; second, a complete change of location of regimental camp. No cases have presented points of special interest and no autopsies have been made.

CONDENSED SICK REPORT FOR JUNE.

Mean strength	1,003
Typhoid fever	22
Intermittent malaria	93
Remittent malaria	36
Diarrhea	57
Other diseases	67
Total	275

The July report is signed by Assistant Surgeon Bauer, who makes the following statement:

Malarial fever, typhoid fever, and diarrhea are the prevailing diseases. In my opinion the cause of the malarial fever is due to the bad location of the camp; the typhoid fever is due mostly to water; the diarrhea, to water and change of diet. The camp has been moved to a better location. All water is now being boiled and filtered. The sanitary conditions are much better, and we now get good sunlight, and I think that the health of the regiment will improve.

CONDENSED SICK REPORT FOR JULY.

Mean strength	1,074
Typhoid fever	28
Diarrhea	166
Intermittent malaria	234
Remittent malaria	66
Dysentery	4
Undetermined fever	3
Other diseases	279
Total	780

In the August report Acting Surgeon Bauer makes the following statement:

The prevailing diseases have been typhoid fever, malarial fever, diarrhea, and jaundice. Bad water and bad air, caused by crowding on so small a place so many men, without proper means of keeping everything clean, are regarded as the causes.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength not given.	
Typhoid fever	32
Intermittent malaria	171
Remittent malaria	172
Diarrhea	187
Dysentery	10
Undetermined fever	8
Other diseases	179
Total	759

In the September report Asst. Surg. Francis M. Shepherd in charge makes the following statement:

The prevailing diseases are malarial fever and jaundice, probably caused by too many men being crowded into Chickamauga Park. This regiment left Chickamauga September 8 and went to Lauderdale, Miss. It was granted thirty days' furlough on account of sickness.

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength	693
Intermittent malaria	67
Remittent malaria	31
Diarrhea	34
Dysentery	4

Typhoid fever	6
Jaundice	56
Other diseases	45
Total	243

The following is a list of the recognized and probable cases of typhoid fever in this regiment:

- No. 1. Company C: Typhoid fever, June 1; sent to Fort McPherson June 28; furloughed August 23.
- No. 2. Company B: Malaria, June 1; sent to Fort McPherson June 28; returned to duty July 12. At Fort McPherson this case was diagnosed typhoid fever.
- No. 3. Company K: Typhoid fever, June 1 to 24.
- No. 4. Company H: Typhoid fever, June 3; died in division hospital June 26.
- No. 5. Company L: Malaria, June 4; died in Leiter Hospital June 27. In hospital this case was diagnosed typhoid fever.
- No. 6. Company F: Malaria, June 5; furloughed August 5.
- No. 7. Company H: Typhoid fever, June 5; furloughed August 15.
- No. 8. Company L: Typhoid fever, June 6. There is no further record of this man, except that he was sent to division hospital June 16.
- No. 9. Company L: Typhoid fever, June 7; furloughed from division hospital July 26.
- No. 10. Company M: Malaria, June 8; furloughed from division hospital July 22.
- No. 11. Company M: Malaria, June 8 to 21.
- No. 12. Company K: Typhoid fever, June 10; furloughed from Leiter Hospital July 23.
- No. 13. Company K: Typhoid fever, June 13; furloughed from division hospital August 2.
- No. 14. Company M: Diarrhea, June 13 to July 1.
- No. 15. Company D: Malaria, June 13 to July 2.
- No. 16. Company K: Typhoid fever, June 14; furloughed from division hospital August 1.
- No. 17. Company L: Typhoid fever, June 15; died in Leiter Hospital July 10.
- No. 18. Company L: Typhoid fever, June 15; died in division hospital July 5.
- No. 19. Company K: Typhoid fever, June 15; furloughed from division hospital July 5. This man is recorded as having had malaria from June 12 to 15. This shows that his initial date for typhoid fever was June 12 instead of June 15.
- No. 20. Company K: Typhoid fever, June 15; furloughed from Leiter Hospital July 23.
- No. 21. Company H: Malaria, June 15 to July 5.
- No. 22. Company A: Malaria, June 16 to 27.
- No. 23. Company D: Typhoid fever, June 17; furloughed July 27.
- No. 24. Company D: Typhoid fever, June 17. This man was sent to the division hospital June 17, and there is no further record of him.
- No. 25. Company E: Typhoid fever, June 17 to August 11.
- No. 26. Company I: Malaria, June 18 to 28.
- No. 27. Company F: Malaria, June 18 to 28.
- No. 28. Company L: Malaria, June 19; furloughed from division hospital July 26.
- No. 29. Company H: Typhoid fever, June 19; furloughed from division hospital July 28.
- No. 30. Company not given: Malaria, June 20; furloughed August 31.
- No. 31. Company E: Malaria, June 20; still sick in division hospital August 31.
- No. 32. Company E: Malaria, June 20 to 30.
- No. 33. Staff: Typhoid fever, June 20; still sick July 31.
- No. 34. Company H: Typhoid fever, June 21; furloughed from division hospital July 27.
- No. 35. Company H: Typhoid fever, June 21; furloughed from division hospital June 27.

- No. 36. Company B: Malaria, June 21 to August 10.
 No. 37. Company D: Malaria, June 22 to July 24.
 No. 38. Company K: Typhoid fever, June 23; furloughed from Leiter Hospital August 11.
 No. 39. Company K: Malaria, June 23; furloughed from division hospital August 5.
 No. 40. Company D: Malaria, June 24 to July 6.
 No. 41. Company G: Malaria, June 24 to July 26.
 No. 42. Company G: Malaria, June 24 to July 9.
 No. 43. Company B: Typhoid fever, June 24; furloughed from division hospital August 15.
 No. 44. Company C: Malaria, June 25; furloughed August 28.
 No. 45. Company M: Typhoid fever, June 25; furloughed from division hospital July 27.
 No. 46. Company D: Typhoid fever, June 26; furloughed from division hospital July 27.
 No. 47. Company D: Typhoid fever, June 26 to July 17.
 No. 48. Company A: Typhoid fever, June 27; died in Leiter Hospital July 4.
 No. 49. Company C: Typhoid fever, June 28; furloughed from division hospital July 31.
 No. 50. Company L: Typhoid fever, June 29; sent to Fort McPherson July 25; died July 26.
 No. 51. Staff: Typhoid fever, June 30; furloughed August 3.
 No. 52. Company D: Malaria, June 30; still sick in division hospital July 31.
 No. 53. Company A: Malaria, June 30 to July 10.
 No. 54. Company E: Malaria, July 1; still sick July 31.
 No. 55. Company A: Malaria, July 1 to 30.
 No. 56. Company A: Malaria, July 2 to 27.
 No. 57. Company G: Typhoid fever, July 2 to August 5.
 No. 58. Company K: Malaria, July 2 to 25.
 No. 59. Company F: Malaria, July 3 to 15.
 No. 60. Company K: Malaria, July 3 to 23.
 No. 61. Company K: Malaria, July 4 to September 5. This man is recorded as having had malaria from June 12 to 15.
 No. 62. Company I: Malaria, July 5 to 22.
 No. 63. Company M: Typhoid fever, July 6; died September 11.
 No. 64. Company C: Malaria, July 7 to 17.
 No. 65. Company A: Malaria, July 7 to 29.
 No. 66. Company C: Malaria, July 10 to 31.
 No. 67. Company M: Malaria, July 10; furloughed August 9.
 No. 68. Company F: Malaria, July 10 to 30.
 No. 69. Company C: Malaria, July 14; still sick in division hospital August 31.
 No. 70. Company G: Malaria, July 14 to August 1.
 No. 71. Company M: Malaria, July 14 to August 19.
 No. 72. Company I: Malaria, July 15; still sick July 31.
 No. 73. Company C: Malaria, July 15; still sick in division hospital July 31.
 No. 74. Company A: Malaria July 15; still sick in hospital July 31.
 No. 75. Company I: Malaria, July 15 to August 15.
 No. 76. Company G: Typhoid fever, July 15; furloughed from division hospital October 4.
 No. 77. Company K: Malaria, July 15 to August 6.
 No. 78. Company C: Typhoid fever, July 16; furloughed from division hospital September 11.
 No. 79. Company C: Malaria, July 16; furloughed August 27.
 No. 80. Company K: Typhoid fever, July 16; furloughed August 4.
 No. 81. Company K: Typhoid fever, July 18; died in Leiter Hospital July 28.
 No. 82. Company M: Malaria, July 19; still sick July 31.
 No. 83. Company M: Malaria, July 19 to August 20.
 No. 84. Company K: Malaria, July 19; furloughed August 22.
 No. 85. Company G: Malaria, July 20; still sick in hospital August 19. In hospital this diagnosis was changed to typhoid fever.
 No. 86. Company B: Malaria, July 20; furloughed August 15. In hospital this diagnosis was changed to typhoid fever.
 No. 87. Company I: Malaria, July 20; still sick in hospital July 31.
 No. 88. Company K: Malaria, July 22; furloughed August 1.
 No. 89. Company M: Malaria, July 22 to August 18.
 No. 90. Company G: Typhoid fever, July 22; furloughed from division hospital August 22.
 No. 91. Company F: Malaria, July 22; died in Leiter Hospital August 15. In hospital this diagnosis was changed to typhoid fever.
 No. 92. Company M: Malaria, July 23; furloughed August 5.
 No. 93. Company L: Malaria, July 23; furloughed July 29.
 No. 94. Company I: Malaria, July 24; furloughed August 3.
 No. 95. Company D: Typhoid fever, July 25; furloughed from division hospital August 19.
 No. 96. Company K: Malaria, July 25; still sick in division hospital August 19.
 No. 97. Company F: Malaria, July 26; furloughed August 5.
 No. 98. Company L: Malaria, July 26; furloughed August 22.
 No. 99. Company A: Typhoid fever, July 26; died August 12.
 No. 100. Company I: Malaria, July 26; furloughed August 21.
 No. 101. Company K: Typhoid fever, July 27; disposition not given.
 No. 102. Company K: Malaria, July 28; furloughed August 18.
 No. 103. Company M: Typhoid fever, July 28; sent to division hospital July 31. There is no further record of this case.
 No. 104. Company F: Malaria, July 28; furloughed August 5.
 No. 105. Company K: Malaria, July 28; furloughed August 8.
 No. 106. Company G: Malaria, July 28; furloughed August 22.
 No. 107. Company M: Malaria, July 29; furloughed August 23.
 No. 108. Company D: Typhoid fever, July 29; furloughed August 5.
 No. 109. Company F: Malaria, July 29; furloughed August 22.
 No. 110. Company K: Malaria, July 29; furloughed August 22.
 No. 111. Company F: Malaria, July 29 to August 18.
 No. 112. Company H: Malaria, July 30; still sick in hospital August 31.
 No. 113. Company E: Malaria, July 30; furloughed August 14.
 No. 114. Company M: Malaria, July 30 to August 13.
 No. 115. Company K: Malaria, July 30; furloughed August 5.
 No. 116. Company B: Malaria, July 30; furloughed August 27.
 No. 117. Company E: Malaria, July 30; furloughed August 15.
 No. 118. Company B: Malaria, July 30 to September 10.
 No. 119. Company F: Malaria, July 31 to August 25.
 No. 120. Company B: Malaria, July 31 to August 18.
 No. 121. Company E: Malaria, July 31; still sick in division hospital August 31.
 No. 122. Company G: Typhoid fever, July 31; died in Sternberg Hospital August 31.
 No. 123. Company B: Malaria, July 31; furloughed August 22.
 No. 124. Company K: Malaria, August 1; furloughed August 6.
 No. 125. Company B: Malaria, August 1 to 24.
 No. 126. Company A: Malaria, August 1 to 29.
 No. 127. Company H: Typhoid fever, August 1; still sick in Leiter Hospital August 31.
 No. 128. Company F: Malaria, August 2; furloughed from division hospital August 22. In hospital this case was diagnosed typhoid fever.
 No. 129. Company C: Typhoid fever, August 2; furloughed August 15.
 No. 130. Company F: Malaria, August 2; still sick in division hospital August 31.
 No. 131. Company F: Malaria, August 2; still sick in division hospital August 31.
 No. 132. Company A: Malaria, August 2 to 14.
 No. 133. Company I: Malaria, August 3 to 16.
 No. 134. Company A: Malaria, August 3; furloughed August 22.
 No. 135. Company D: Malaria, August 3 to 13.

- No. 136. Company H: Malaria, August 3; furloughed August 22.
- No. 137. Company C: Malaria, August 4 to 17.
- No. 138. Company G: Malaria, August 5; still sick in division hospital August 31.
- No. 139. Company M: Malaria, August 5; still sick in division hospital August 31.
- No. 140. Company B: Malaria, August 5 to 22.
- No. 141. Company B: Malaria, August 5; still sick in Sternberg Hospital August 31.
- No. 142. Company I: Malaria, August 5; furloughed August 22.
- No. 143. Company B: Malaria, August 5; furloughed August 22.
- No. 144. Company K: Remittent malaria, August 5 to 16.
- No. 145. Company K: Malaria, August 6; still sick in division hospital August 31.
- No. 146. Company C: Malaria, August 6; furloughed August 15.
- No. 147. Company E: Typhoid fever, August 6; furloughed August 11.
- No. 148. Company A: Typhoid fever, August 6; furloughed August 19.
- No. 149. Company E: Typhoid fever, August 7; furloughed from division hospital August 17.
- No. 150. Company B: Malaria, August 7 to 26.
- No. 151. Company E: Malaria, August 7; furloughed August 15.
- No. 152. Company C: Malaria, August 7; furloughed August 22.
- No. 153. Company H: Typhoid fever, August 7; sent to division hospital August 7; further disposition not given.
- No. 154. Company L: Malaria, August 8; furloughed August 22.
- No. 155. Company B: Diarrhea, August 8; furloughed August 22.
- No. 156. Company B: Malaria, August 8; furloughed August 22.
- No. 157. Company L: Typhoid fever, August 8; furloughed August 21.
- No. 158. Company K: Malaria, August 8 to 30.
- No. 159. Company I: Malaria, August 9; furloughed August 22.
- No. 160. Company L: Malaria, August 9; still sick in division hospital August 31. In hospital this case was diagnosed typhoid fever.
- No. 161. Company I: Malaria, August 9; still sick in division hospital August 31.
- No. 162. Company F: Malaria, August 9; furloughed from division hospital August 24.
- No. 163. Company K: Malaria, August 9; furloughed August 18.
- No. 164. Company M: Malaria, August 9; still sick September 30.
- No. 165. Company G: Typhoid fever, August 10; furloughed from Sternberg Hospital October 24.
- No. 166. Company E: Malaria, August 10; furloughed from division hospital August 26.
- No. 167. Company I: Malaria, August 10; furloughed August 22.
- No. 168. Company C: Malaria, August 10; furloughed August 15.
- No. 169. Company L: Malaria, August 10; still sick in division hospital August 31.
- No. 170. Company H: Malaria, August 11; furloughed August 22.
- No. 171. Company I: Malaria, August 11; furloughed August 21.
- No. 172. Company E: Malaria, August 11; furloughed August 22.
- No. 173. Company B: Malaria, August 11; furloughed August 22.
- No. 174. Company G: Malaria, August 12; furloughed August 22.
- No. 175. Company B: Malaria, August 12; furloughed August 22.
- No. 176. Company H: Malaria, August 12; still sick in hospital August 31.
- No. 177. Company A: Malaria, August 12; furloughed August 22. In hospital this case was diagnosed typhoid fever.
- No. 178. Company B: Malaria, August 12 to 26.
- No. 179. Company B: Malaria, August 12; still sick in division hospital August 31.
- No. 180. Company H: Malaria, August 12; furloughed August 22.
- No. 181. Company K: Typhoid fever, August 12; still sick in division hospital August 31.
- No. 182. Company C: Malaria, August 12; furloughed August 15.
- No. 183. Company K: Malaria, August 13; still sick in division hospital August 31.
- No. 184. Company B: Typhoid fever, August 13; furloughed August 22.
- No. 185. Company A: Malaria, August 13; furloughed August 22.
- No. 186. Company C: Jaundice, August 13 to September 5.
- No. 187. Company G: Malaria, August 13; furloughed from division hospital August 22.
- No. 188. Company A: Malaria, August 13; furloughed from division hospital August 26.

- No. 302. Company E: Malaria, August 24; still sick in division hospital September 30.
- No. 303. Company F: Malaria, August 24; still sick in division hospital September 30. In hospital this case was diagnosed typhoid fever.
- No. 304. Company I: Malaria, August 24 to September 12.
- No. 305. Company M: Malaria, August 24; furloughed from division hospital.
- No. 306. Company C: Malaria, August 24; furloughed September 5.
- No. 307. Company H: Malaria, August 24; furloughed from division hospital August 29.

No. 308. Company M: Malaria, August 25; furloughed from division hospital August 28.

No. 309. Company L: Malaria, August 25; furloughed from division hospital August 28.

No. 310. Company K: Malaria, August 25; furloughed from division hospital September 3.

No. 311. Company I: Malaria, August 25; furloughed September 5.

No. 312. Company M: Malaria, August 25; still sick in division hospital September 30. In hospital this case was diagnosed typhoid fever.

No. 313. Company G: Malaria, August 25; still sick in division hospital September 30. In hospital this case was diagnosed typhoid fever.

No. 314. Company B: Malaria, August 25; furloughed August 30.

No. 315. Company E: Malaria, August 25; furloughed from division hospital September 8. In hospital this case was diagnosed typhoid fever.

No. 316. Company M: Diarrhea, August 25 to September 16.

No. 317. Company E: Malaria, August 26; furloughed August 27. This man was sent to hospital July 26 with a diagnosis of remittent malaria, and was returned to sick quarters August 5. There is no evidence that he returned between August 5 and 26.

No. 318. Company M: Malaria, August 26 to September 16.

No. 319. Company B: Malaria, August 26 to September 10.

No. 320. Company M: Diarrhea, August 26 to September 16.

No. 321. Company K: Malaria, August 26; furloughed August 31. This man was reported with diarrhea July 30, and there is no record of his having been returned to duty.

No. 322. Company I: Malaria, August 26; furloughed from division hospital August 29.

No. 323. Company H: Malaria, August 26; furloughed August 27.

No. 324. Company F: Malaria, August 26; furloughed from division hospital August 29.

No. 325. Company M: Jaundice, August 26 to September 16.

No. 326. Company K: Malaria, August 26; furloughed from division hospital August 31. This man is recorded as having had dysentery August 20 to 22.

No. 327. Company K: Malaria, August 26; furloughed August 31.

No. 328. Company K: Malaria, August 26; furloughed September 3.

No. 329. Company B: Malaria, August 26; still sick in division hospital September 30.

No. 330. Company M: Diarrhea, August 26 to September 16.

No. 331. Company A: Malaria, August 26; furloughed September 2.

No. 332. Company H: Malaria, August 27; furloughed from division hospital November 5. In hospital this case was diagnosed typhoid fever.

No. 333. Company A: Malaria, August 27; furloughed August 28.

No. 334. Company A: Malaria, August 27; sent to Leiter Hospital September 3.

No. 335. Company B: Typhoid fever, August 27; furloughed September 1.

No. 336. Company H: Malaria, August 27; furloughed September 1.

No. 337. Company C: Jaundice, August 27; furloughed September 5.

No. 338. Company D: Typhoid fever, August 27; disposition not given.

No. 339. Company K: Malaria, August 28; still sick in division hospital September 30.

No. 340. Company K: Jaundice, August 28 to September 14.

No. 341. Company C: Malaria, August 28; furloughed September 4.

No. 342. Company A: Diarrhea, August 28; sent to Leiter Hospital September 3. This man is recorded as having had diarrhea June 23 and 24.

No. 343. Company L: Malaria, August 28; furloughed September 7.

No. 344. Company D: Undetermined fever, August 28; still sick in division hospital September 30.

No. 345. Company C: Malaria, August 28; furloughed August 31.

No. 346. Company K: Malaria, August 29; furloughed from division hospital August 31.

No. 347. Company E: Malaria, August 29 to September 12.

No. 348. Company E: Malaria, August 29; still sick in division hospital September 30. In hospital this case was diagnosed typhoid fever.

No. 349. Company H: Malaria, August 29; still sick in division hospital September 30.

No. 350. Company F: Diarrhea, August 29 to September 15.

No. 351. Company K: Malaria, August 29; furloughed August 31.

No. 352. Company B: Malaria, August 29; still sick in division hospital September 30.

No. 353. Company K: Malaria, August 29; furloughed August 31.

No. 354. Company B: Malaria, August 29; still sick in division hospital September 30.

No. 355. Company H: Typhoid fever, August 30; furloughed from Sternberg Hospital October 20.

No. 356. Company I: Malaria, August 30; furloughed from division hospital September 3.

No. 357. Company C: Malaria, August 30; furloughed September 4.

No. 358. Company H: Typhoid fever, August 30; sent to division hospital August 30. Further disposition not given.

No. 359. Company F: Malaria, August 30; furloughed September 11.

No. 360. Company M: Typhoid fever, August 31; furloughed from Sternberg Hospital September 3.

No. 361. Company H: Jaundice, August 31 to September 15.

No. 362. Company B: Malaria, August 31; furloughed September 6.

No. 363. Company E: Malaria, August 31; furloughed September 11.

No. 364. Company K: Typhoid fever, August 31; furloughed from Sternberg Hospital October 4.

No. 365. Company M: Typhoid fever, August 31; furloughed from Sternberg Hospital October 19.

No. 366. Company D: Malaria, August 31; furloughed from division hospital October 8. In hospital this case was diagnosed typhoid fever.

No. 367. Company D: Malaria, August 31; still sick in division hospital September 31.

No. 368. Company D: Typhoid fever, August 31; died in Sternberg Hospital October 5.

No. 369. Company B: Malaria, September 1 to 10.

No. 370. Company C: Malaria, September 1 to 20.

No. 371. Company H: Malaria, September 1 to 15.

No. 372. Company I: Malaria, September 1; still sick in division hospital September 30.

- No. 397. Company K: Typhoid fever, November 1; furloughed November 16.

SUMMARY.

Assembled at Camp Patrick Henry, near Jackson, Miss., in May, 1898.

Mustered into United States service May 26, 1898.

Arrived at Chickamauga Park, Ga., May 31, 1898.

Strength on arrival, 995.

Date of first case of probable typhoid fever, June 1, 1898.

Date of first case of recognized typhoid fever, June 1, 1898.

Left Chickamauga Park, Ga., September 8, 1898.

Strength on departure, 1,029.

Number of cases of probable typhoid fever developed at Chickamauga 388

Went from Chickamauga Park, Ga., to Lauderdale, Miss., and was here disbanded on furlough.

Number of cases of probable typhoid fever developed after leaving Chickamauga 9

Total number of cases of probable typhoid fever developed in the First Mississippi Volunteer Infantry from May to November, 1898..... 397

These 397 cases were diagnosed as follows:

Typhoid fever.....	98
Malaria.....	279
Diarrhea.....	9
Jaundice.....	9
Undetermined fever.....	2
Total.....	397

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
1898.				
Allen, William (1st).....	Pvt., F.	Aug. 29	Sterns Creek, Miss.....	Typhoid.
Anderson, L. R.....	Pvt., C.	Oct. 23	Natches, Miss.....	Yellow fever.
Brown, Felix F.....	Pvt., G.	Aug. 31	Hazelhurst, Miss.....	Typhoid.
Cavanah, Wiley B.....	Artif., E.	Sept. 27	Do.
Chambass, Sol.....	Pvt., L.	July 4	Camp Thomas, Ga.....	Do.
Cogan, Carroll F.....	Pvt., B.	Sept. 15	Stonington, Miss.....	Do.

Name.	Rank and company.	Date.	Place of death.	Cause of death.
1898.				
Cowart, Homer G.....	Pvt., L.	July 10	Leiter Hospital, Ga.....	Typhoid.
Edmandson, W. J.....	Pvt., B.	Aug. 17	Chickamauga, Ga.....	Do.
Gentry, John F.....	Pvt., F.	Aug. 15	Camp Thomas, Ga.....	Do.
Godwin, Lovett H.....	Pvt., L.	Sept. 25	Reiderville, Ala.....	Cerebro-spinal meningitis.
Gibson, Merry E.....	Pvt., A.	Aug. 24	Vicksburg, Miss.....	Typhoid.
Hamilton, E. S.....	Pvt., A.	June 26	Camp Thomas, Ga.....	Do.
Harrington, B. M.....	Hos. std.	Dec. 21	Columbia, Tenn.....	Do.
Higdon, Nick C.....	Pvt., B.	Sept. 19	Hazelhurst, Miss.....	Do.
Hunamer, Leigh W.....	Corpl., K.	July 28	Camp Thomas, Ga.....	Do.
Humes, J. E., jr.....	Pvt., I.	Aug. 22	Meridian, Miss.....	Do.
McGilvray, Alex E.....	Pvt., H.	Aug. 21	Camp Thomas, Ga.....	Do.
Marshall, H. C.....	2d lt., F.	Dec. 15	Columbia, Tenn.....	Do.
Partin, Thomas J.....	Pvt., K.	Aug. 25	Sternberg Hospital, Chickamauga, Ga.....	Do.
Ray, John E.....	Pvt., I.	Sept. 10	Enterprise, Miss.....	Do.
Reid, William M.....	Pvt., A.	July 3	Chickamauga, Ga.....	Do.
Ridgeway, E. A.....	Pvt., L.	July 26	Fort McPherson, Ga.....	Do.
Satchen, Norman.....	Pvt., K.	Aug. 13	Quitman, Miss.....	Measles.
Shields, Thomas C.....	2d lt., C.	Oct. 27	Burhurst, Miss.....	Yellow fever.
Smith, James S.....	Pvt., A.	Aug. 4	Camp Thomas, Ga.....	Typhoid.
Torry, William A.....	Pvt., L.	Aug. 23	Cootspa, Ala.....	Do.
Trenninel, Emile.....	Pvt., D.	Aug. 25	Chickamauga, Ga.....	Do.
Waits, Samuel B.....	Pvt., G.	Aug. 31	Chattanooga, Tenn.....	Do.
Walker, Ben M., Jr.....	Pvt., G.	Aug. 6	Do.
Walker, Ellis E.....	Pvt., L.	Sept. 3	Sternberg Hospital, Camp Thomas, Ga.....	Do.
Wallace, Henry C.....	Pvt., M.	Sept. 10	Lauderdale, Miss., Springs.	(Typhoid); heart failure.
Wallis, Alain V.....	Pvt., L.	June 27	Camp Thomas, Ga.....	Typhoid.
Weckerman, Thos. P.....	Pvt., B.	Aug. —	Chickamauga, Ga.....	Do.

Total deaths..... 33
Deaths due to typhoid fever..... 29

Percentage of deaths among probable cases of typhoid fever (397), 7.30.

Percentage of deaths among recognized cases of typhoid fever (98), 29.59.

It was a common opinion among medical officers at Chickamauga that this regiment brought the typhoid infection to the park, and that it spread from this to other commands. It is undoubtedly true that the First Mississippi reached Chickamauga Park quite widely infected with typhoid fever, but it is not true that this is the only regiment that reached this national encampment in this condition. As we have already seen the majority of the regiments of the First and Third Army Corps reached Chickamauga Park already infected with typhoid fever. The surgeon in charge of the First Mississippi recognized his earlier cases and diagnosed them properly, and for this reason this regiment acquired a bad reputation, which undoubtedly it deserved, but not more so than a large majority of the other regiments. We mean by a bad reputation simply that it reached the park widely infected with typhoid fever.

COMMUNICATIONS FROM THE SURGEONS OF THE FIRST MISSISSIPPI VOLUNTEER INFANTRY.

Medical officers.

Robert L. Turner, major and surgeon, Meridian, Miss.

Henry L. Beamer, captain and assistant surgeon, McComb City, Miss.

Frances M. Shepperd, lieutenant and assistant surgeon, Waynesboro, Miss.

Under date of July 19, 1899, Major Turner gives us the following information:

In my report for May I should have stated that we left two patients in Jackson, both quite sick with what I believed was typhoid fever. We carried at least two developed cases of typhoid

fever to Chickamauga, and I believe that we carried a large number of infected men. Our camp at Jackson was badly crowded in an old field, with very little shade, and we had bad water to drink. I think that the general water supply at Chickamauga was contaminated through Cave Spring Branch. I also think that many of our men were infected by flies from sinks, which were not more than 30 feet from our regimental hospital tents. These sinks were not moved until I made an appeal through higher authority and not until they were filled with myriads of flies and maggots. As soon as the Second Division Hospital of the Third Army Corps was organized, I was detailed to take charge of it and remained there until June 29, when I was stricken with typhoid fever myself. After being in bed more than three months my regiment was furloughed, and I was unable to attend to my duties afterwards. Therefore I know very little about the sick reports of the First Mississippi. I know that B. M. Herrington, whose name appears in the list of deaths, died from cerebro-spinal meningitis and not typhoid fever. I think that Lieutenant Marshall died of yellow fever.

Captain Beamer speaks of the camp sites at Chickamauga as follows:

Our camp was situated just below the Third Tennessee and to the rear of the Fifty-second Iowa. All the filth from the Third Tennessee washed down into our camp, and it was impossible to keep it in good condition. At first we obtained our drinking water from a spring about three-quarters of a mile from camp. Later our camp was moved nearer to this spring. This site was all right until it rained, when it was found that we were located in a swamp. The ground became very muddy; and as there were no floors in the tents, the men were compelled to sleep on the wet ground. Finally we moved out onto a hill into the open air, and at this place we had a nice camp. The flies were very numerous. I think that the spring from which we obtained our water was contaminated.

GENERAL REMARKS CONCERNING TYPHOID FEVER IN THE SECOND DIVISION OF THE THIRD ARMY CORPS.

When we reached Chickamauga Park on our round of inspection (September 10, 1898) all the regiments of this division, with the exception of the Second Kentucky and the Ninth New York, had already departed from the park. We have already given a statement of the condition in which we found the two remaining regiments. For the following information concerning the division as a whole we are indebted to the testimony of Maj. James M. Jenne, chief surgeon of this division. Major Jenne reached Chickamauga Park June 11 and acted as medical inspector until July 16, when he was made chief surgeon of the division. All the regiments were on the ground when Major Jenne arrived. The First Arkansas was located on very low ground, while directly above this regiment were the Ninth New York and the Second Kentucky. The First Arkansas was partially protected from the drainage of the other regiments by a shoulder of the hill that projected behind the officers' quarters. The Second Brigade was situated on the same level, but farther south, with an intervening creek which flowed only after rains. Overlapping the Second Brigade and extending beyond one of its flanks onto higher ground was the First Maine. The Fifty-second Iowa was still farther south and situated

upon a rocky shoulder of ground quite elevated in some portions and wholly denuded of soil. In this regiment the tents were pitched upon the rocks, and the guy ropes were held in position by piles of rock. The Mississippi regiment was somewhat farther south and upon quite low ground in dense shade. A little stream coming from the heights above passed through this camp. This stream originated in the Second Brigade. It was only about 60 paces from the kitchens of the Fifty-second Iowa and the nearest line officer's tent of the Third Tennessee, which belonged to the Third Brigade of the First Division of the Third Army Corps. South of the Mississippi regiment was the Alexandria road, and on the west of this a small stream and an open field. On account of the location the sinks of the Mississippi regiment could not be placed over 30 paces from their company kitchens and about the same distance from other regiments. Major Jenne stated that he remembered going to the camp of the First Mississippi and pacing the ground from the kitchen to the sink, which he found to be 30 paces, and the same distance from the sinks of the Mississippi regiment to the line officers' tents of the Third Tennessee. In locating the sinks of the First Mississippi it was impossible to go farther south or west on account of the little stream which rapidly filled after rains, overflowed its banks, and flooded the woods for some distance. If the sinks had been dug to the west, in the open field, they would have been submerged at times when the stream overflowed. It seemed necessary to locate the sinks where they were placed. It will be seen from this that these regiments were quite crowded, that they were all located in the woods, and that the drainage from some of them passed through the sites of others. The First Arkansas received more or less of the drainage from the Ninth New York and the Second Kentucky. The Ninth New York received, in part at least, the drainage of the Second Kentucky.

When Major Jenne reached Chickamauga all of the regiments were using Chickamauga Creek water, distributed through the commands by means of pipes. Later, this water becoming suspicious, some of these regiments began to draw water from springs, especially from Blue Spring and Crawfish Spring. Water distributed through the pipes was turbid and warm, inasmuch as the pipes were above the ground. Attempts were made, especially in the First Maine and the Fifty-second Iowa, to boil all the drinking water, but according to Major Jenne the supply of boiled water was at no time sufficient, and the men daily took water from other sources. There was only one driven well near the regiments of this division, and Major Jenne is of the opinion that the water from this was not at all times used. After the medical officers became suspicious of the Chickamauga Creek water, and attempted to substitute spring water for it, there was a general shortage of drinking water on account of there being an insuffi-

cient number of barrels in which it could be transported. On account of this insufficient supply of water from the springs men continued to drink more or less of the piped water, and doubtless drank at times from wet-weather springs.

An attempt was made to filter the water for the entire division. Each regiment was furnished with eleven pairs of Maignem and Berkefeld filters. In the First Brigade these filters were brought together at one place and an attempt was made to filter enough drinking water for the whole brigade. This attempt to filter the water did not prove successful. The Maignem filters soon became obstructed and many of the Berkefeld filters were broken. The filtering plant for the First Brigade was in charge of a detail from the Ninth New York, and within a few days so many filters were disabled or broken that the attempt was given up and pronounced a failure. In the Second and Third brigades each regiment attempted to filter its own water, but in these also the same result was reached—the filters became clogged, many were broken, and the attempt was discontinued. At this place we wish to state that in our opinion for troops in the field all attempts made to filter the water by means of the Maignem and Berkefeld filters were failures. We do not consider these filters at all adapted to this purpose. In permanent garrisons where the filters can be attached to hydrants they are undoubtedly of service, but in the field, where it frequently happens that water containing suspended matter must be filtered, these filters, together or singly, have not been a success and will not be a success. The national encampments at Chickamauga and Camp Meade were strewn with broken filters, which represented a large and useless expenditure.

Major Jenne stated that throughout this division there were numerous wet-weather springs from which the men frequently drank. It is more than likely that these springs account very largely for the large number of cases and the excessive mortality from typhoid fever in this division. As has been already stated, some of the regiments were located upon rocky knolls. The rains falling upon these sites washed infected matter under the rocks, carried it some distance under the surface of the ground, and broke out lower down the hillside, often within other regimental encampments, as wet-weather springs, from which the men drank to a greater or less extent.

When asked his opinion concerning the origin and spread of typhoid fever in this division, Major Jenne made the following statement:

My belief is that the Mississippi regiment came to the park infected with typhoid fever. From the sinks of this regiment the creek that flowed near by became contaminated. This creek empties into Chickamauga Creek only a few feet below the intake of the general water supply distributed to the regiments. I believe that in this way the general water supply became contaminated and typhoid fever was spread throughout the division.

When asked if he believed that the disease was spread by means of flies, he replied as follows:

Yes; I have no doubt that this was one of the most fruitful means of the spread of the disease. The sinks in some of the regiments of this division, certainly during the wet season, were almost constantly filled with water. A great deal has been stated about the sinks not being properly ditched. This was true in some instances, but had all the sinks been properly ditched they would still have filled with water from the bottom and the sides. When a sink was dug soon after a shower the water would flow into it like a spring. I have seen this time and time again; I have seen men digging sinks and the water flowing in from the sides and bottoms while they were digging. Water did not soak into all the sinks. In digging one on the side of a hill it would be likely to fill with water, while another dug on the level might remain dry. There were some sinks that gave me a great deal of trouble. I used a solution of bichloride of mercury and plenty of lime in them. When they were nearly full of water and fecal matter I put cord wood across them and placed straw and brush on the wood and heaped earth over them. If an attempt had been made to fill these sinks in the ordinary way the earth thrown in would have caused the contents to overflow. Indeed, it is quite out of the question to throw earth into these sinks, because it displaces the water. It was the practice to put straw in them from the corrals and burn them. Some of the sinks were situated on sharp inclines, and during rains they would fill, overflow, and run down the hillsides, sometimes through the camp. There were three regiments situated one after the other passing down the hill, so that whatever wash there was from their sinks and the regiment above came to them. These were the First Mississippi, the Fifty-second Iowa, and the First Maine. Of these three regiments the Fifty-second Iowa occupied the highest ground, and the flow from this site was in one direction toward the First Maine and in the other direction toward the First Mississippi. The Third Tennessee was farther up the hill. All of these regiments were closely crowded together.

In regard to the hospital of this division, Maj. Woodhull, in his report already referred to, makes the following statement:

Nearly, if not all, of the regiments in this division maintained regimental hospitals. For instance, the Ninth New York has from 6 to 8 men in a local hospital out of 60 supposed to be in quarters. In the division hospital are 33. The regiment has had about 30 cases of typhoid, but the proportion of malarial cases is now large. First Arkansas has 37 in hospital and 85 in quarters. When examined there was a small regimental hospital, maintained by individual subscription, in which were 3 cases of dysentery alleged to have been returned from the division hospital. First Maine has 7 men in the regimental hospital. Of the 42 officers, 7, or 16.67 per cent are sick—all with typhoid fever.

The hospital of this division (Major Bradbury, First Maine, in charge) consists of 37 hospital, 8 conical, and 6 common tents, containing 285 cots and 250 patients. Eight medical officers are present for duty, with 6 stewards and 138 privates. Of the latter, 45 were men of the line detailed from regiments. To this date (August 7, 1898) 1,190 patients have passed through the hospital, and 56 typhoid cases were present. Were all the men in the division who should be in hospital present it would be overcrowded, as it has been when men were at times literally upon the ground, and at other times medical officers have given up their own accommodations to them. Sometimes typhoid patients are returned to their regiments for convalescence in order to make room. Speaking generally, the condition of the hospital is very good. The streets are broad and well policed; the general police is excellent; the ordinary wards are very good, but the typhoid ward is too crowded, and formerly was still more so, when the cots touched each other.

There is great difficulty in disinfecting the bedding. The hospital is brigaded, but not the attendants, and there would be difficulty were the command suddenly broken up. There are several brigade surgeons at this hospital and it is plain that they do not regard that as their proper sphere. The records are well kept, but great difficulty is experienced in obtaining supplies. This seems to be partly technical and partly from insufficient stores. I examined the record of a requisition made on the 1st, acted on on the 13th, 17th, and 19th, and on the 22d filled in part. I saw another where 2 articles were supplied out of 17 authorized. The hospital finds it practically impossible to get intestinal antiseptics, such as salol or strychnia or subgallate of bismuth. It is very largely dependent upon regimental and Red Cross funds, and a case of boxes to hold regimental supplies has been arranged to stimulate regimental interest, which is quite foreign to the principle of these organizations. The Red Cross supplies 1,500 pounds of ice daily, milk, food, comforts, and some absolute necessities, as medicine, themselves.

The following figures give the most important facts concerning typhoid fever in this division:

Brigade and regiment.	Date of first case.	Total number of cases.	Number of recognized cases.	Total deaths.	Deaths from typhoid.	Per cent of deaths among probable cases.	Per cent of deaths among recognized cases.
<i>First Brigade.</i>							
Second Kentucky.....	June 26	286	87	30	28	9.79	32.18
Ninth New York.....	June 10	323	139	46	46	14.24	33.09

GENERAL REMARKS CONCERNING TYPHOID FEVER IN THE THIRD ARMY CORPS.

Colonel Hoff, chief surgeon of this corps, has furnished us with considerable valuable information concerning sickness in it. Colonel Hoff reported for duty at Chickamauga Park May 25, 1898, and remained with this corps during its stay there. When asked to give his opinion concerning the introduction of typhoid fever in this corps, Colonel Hoff responded as follows:

Typhoid fever was brought in in the very beginning with the troops. I speak now particularly of the Third Corps, with the history of which I am familiar from the date of its organization. Three regiments joined the Second Division of the Third Corps about the latter part of May or early in June, and these regiments came on the ground with what was practically a disabling sick list. These three regiments were the First Mississippi and the First and Second Arkansas. The record of the First Mississippi begins on the 12th of June and total of sick reported for that day was 64. This number did not include all of those actually sick. There was a large number in the regiment who were sick, but who were not reported at that time. You will see [referring to a chart showing the curve of sickness in this regiment] as we go on we come to a very remarkable upshoot on the 30th day of June. This remarkable upshoot is due to the fact that that regiment was vaccinated at this time. There were one hundred or more men suffering from the effects of vaccination, so this upward move of the curve must be regarded as only an incident. It will be seen that this upward turn reached its maximum on July 2. After this there was a gradual subsidence until the sick report went down to about what it was in the beginning, showing 85 men on the sick report on the 7th day of July. From the latter date on the sick list increased, as you see, with considerable rapidity, reaching the maximum on August 20, on which date the total on sick call numbered 210. From August 20 to September 9, when the First Mississippi left for Lauderdale, the sick curve declines. This is in part due to the fact that men were sent home on sick furlough and were not carried on the sick report. It does not necessarily indicate diminished sickness. The Arkansas regiments came into this camp in practically the same condition as did the Mississippi regiment.

It should be understood that in the above statement Colonel Hoff was speaking of total sickness and not of typhoid fever especially. He convinced us that these three regiments came to Chickamauga with a high sick list and continued in this condition throughout their stay.

It will be seen by reference to the tables already given that of the regiments of the Second Division of this corps (excluding the Sixty-ninth New York, which remained at Chickamauga Park for only a few days) all except the Second Kentucky and the First Maine reached Chickamauga Park infected with typhoid fever; while of those of the First Division (excluding the Fifth Maryland, which remained at Chickamauga Park for only a few days) all reached the park infected with typhoid fever with the exception of the Eighth New York.

Continuing his testimony, Colonel Hoff stated:

The Fifty-second Iowa and the First Maine reached the park in excellent condition. Going over the First Division, the Second Nebraska, Second Missouri, and Fourteenth New York came in excellent shape. The Eighth New York had a doubtful record so

far as is indicated by total sickness from the very beginning. Typhoid fever gradually spread from the infected regiments and soon there were cases in every regiment of the corps. By the middle of July, or earlier, all regiments were reporting a few cases of typhoid fever, but it could be called epidemic only in the three regiments mentioned (First Mississippi, First and Second Arkansas). In most of the regiments at that time typhoid fever was scarcely recognized, most of the cases being designated as "malaria." Up to the middle of August, possibly later, I believe that the infection was spread by means of flies. I believe the water supply became infected about the latter part of July, and from that time on there was a decided rise until it culminated, about August 20.

Colonel Hoff believed that the general water supply taken from Chickamauga Creek became contaminated by the drainage from the camps, but that water contamination was not confined to this source.

He stated:

I thought that every spring and every well, or almost all, in the park must have partaken of the infection. This is only an opinion, but the fact that we had an extraordinary and widespread morbidity leads to the inference that there must have been some common cause.

When asked about the first case of typhoid fever, Colonel Hoff stated:

The first case of typhoid fever that was diagnosticated appeared in the Second Division Hospital about June 15. It appeared about the time when the cases began to be carefully investigated. The hospital opened about June 10, but it was not in running order until about June 15, and I have no doubt that had a careful investigation been made earlier cases of typhoid fever would have been recognized before the time given. It is difficult for anyone who has not been through it to understand what a Herculean task it was to introduce even the simplest form of reports among these organizations. We asked the regimental officers to report to us every day the number of people excused from duty, and we insisted upon this report. After receiving it, I frequently sent an inspector around to find out how the consolidated report agreed with the regimental reports, and I would often find a difference of 50 or 60 between the reports. These inaccuracies were not confined to the medical department. It frequently happened that the consolidated monthly report showed a loss of more than 1,000 men. We kept no specific account of typhoid fever. We had a general record of the morbidity without reference to any one disease. There were many cases of measles and mumps, and a good many cases of fever diagnosticated as "malarial fever." A few of the cases were diagnosticated as "typhoid fever," but the latter were in proportion to the whole comparatively rare.

When asked if he could approximate the date on which he believed the general water supply became infected, Colonel Hoff stated:

I should say about July 20, judging from the rapid advance of the disease from that time. I do not mean to say that the number of cases began to increase immediately after July 20, but that the increase was more marked two or three weeks after this date, and this is the reason why I believe that there must have been some infection about that time from some source that was capable of producing a general infection. The water supply was the only thing the regiments were using in common. The advance of the disease, so far as the First Division of the Third Army Corps is con-

cerned, was exceedingly slow. This division always had a lower curve than the Second Division, but the two curves went up simultaneously.

Colonel Hoff was of the opinion that the Second Division suffered more heavily than the First on account of the presence in the Second Division of the three highly infected regiments. He also believed that the infection spread from the Second Division through the First, notably through the Third Brigade of the First Division, which was encamped very near the Third Brigade of the Second Division.

The following figures show the relative prevalence of typhoid fever and the mortality from this disease in the two divisions of the Third Army Corps:

Total number of cases of probable typhoid fever in eight regiments of the First Division	1,853
(It will be seen that this includes the Second New York which remained at Chickamauga only twelve days.)	
Total number of cases of probable typhoid fever in the nine regiments of the Second Division	2,565
Total number of deaths from typhoid fever in eight regiments of the First Division	160
Total number of deaths from typhoid fever in the nine regiments of the Second Division	257
Percentage of deaths among probable cases of typhoid fever in eight regiments of the First Division	8.63
Percentage of deaths among probable cases of typhoid fever in the nine regiments of the Second Division	10.02
Total number of cases of recognized typhoid fever in eight regiments of the First Division	725
Total number of cases of recognized typhoid fever in the nine regiments of the Second Division	1,016
Percentage of deaths among recognized cases of typhoid fever in eight regiments of the First Division	22.07
Percentage of deaths among recognized cases of typhoid fever in the nine regiments of the Second Division	25.29
Aggregate strength of the eight regiments in the First Division	9,444
Aggregate strength of the nine regiments in the Second Division	11,124
Percentage of cases of probable typhoid fever in eight regiments of the First Division	19.62
Percentage of cases of probable typhoid fever in the nine regiments of the Second Division	23.06

It will be seen from these figures that typhoid fever was both absolutely and relatively more prevalent in the Second Division than in the First Division of this corps.

Aggregate strength of the seventeen regiments of this corps.	20,568
Total number of cases of probable typhoid fever in the seventeen regiments of this corps	4,418
Percentage of cases of probable typhoid fever in the seventeen regiments of this corps	21.47
Total number of deaths from typhoid fever in the seventeen regiments of this corps	417
Percentage of deaths among probable cases of typhoid fever in the seventeen regiments of this corps	9.43

The table following will show the morbidity and mortality from typhoid fever in the Third Army Corps.

Table showing for certain regiments of the Third Army Corps at Chickamauga the mortality and morbidity from typhoid fever.

Regiments.	Mean strength.	Cases of typhoid fever.		Deaths from typhoid fever.	Deaths from all diseases.	Deaths from typhoid fever in 100 cases of—		Percentage of deaths from typhoid to deaths from all diseases.	Morbidity of typhoid fever in 1,000 mean strength.		Deaths from typhoid fever in 1,000 of mean strength.
		Certain.	Certain and probable.			Certain typhoid.	Certain and probable.		For certain cases of typhoid.	For certain and probable cases of typhoid.	
First Division, Third Corps.

CHAPTER VI.

TYPHOID FEVER IN OTHER ORGANIZATIONS AT CHICKAMAUGA.

CONTENTS.

	Page.
Third United States Volunteer Cavalry, Cavalry Brigade, First Corps	269
First Illinois Volunteer Cavalry	271
First Ohio Volunteer Cavalry	273
Light Artillery Brigade, First Corps	277
Sixth United States Volunteer Infantry	277
Eighth United States Volunteer Infantry	279
Hospital Corps men, First and Third Army Corps	281
Female nurses at Chickamauga	283

Besides the regiments already given as constituting the First and Third Army Corps, certain other organizations attached to one of these corps, but not an integral part of it, were stationed for awhile at Chickamauga. A brief statement of the prevalence of typhoid fever among these organizations may be of interest.

TYPHOID FEVER IN THE CAVALRY BRIGADE OF THE FIRST ARMY CORPS.

CAVALRY BRIGADE OF THE FIRST ARMY CORPS.

Regiment.	Arrived at Chick- amauga.	Strength on arrival.	Left Chicka- mauga.	Strength on leaving.	No. of cases devel- oped at Chicka- mauga.	No. of cases devel- oped after leaving Chicka- mauga.
Third United States Volunteer Cavalry ..	May 30	1,004	Sept. 10	1,013	270	0
First Illinois Volun- teer Cavalry	June 1	1,255	Aug. 25	1,299	159	61
First Ohio Volunteer Cavalry	May 15	830	July 13	833	9	180

THIRD UNITED STATES VOLUNTEER CAVALRY.

First Cavalry Brigade, First Army Corps.

This regiment was recruited chiefly in Montana, Idaho, and the Dakotas. It arrived at Chickamauga Park in detachments, as follows: Troops B, E, and K, May 23; Troops A, C, and D, May 27; Troops I and M, May 28; Troops G and H, May 29; Troops F and L, May 30.

The medical officer at this time, Roy A. Wilson, first assistant surgeon, did not arrive until the last of the month. Consequently there is no report for May.

The June report is signed by Maj. Henry G. Fish, who states:

Measles have been prevalent, but are decreasing.

CONDENSED SICK REPORT FOR JUNE.

Mean strength	1,004
Intermittent fever	2
Malaria	1
Diarrhea	139
Colitis	4
Dysentery	1
General debility	2
Intestinal intoxication	1
Intestinal disturbance and fever	1
Intestinal fever	4
Constipation and fever	1
Other diseases	94
Total	250

In the July report Roy A. Wilson, assistant surgeon, states:

The prevailing diseases are typhoid fever and malaria; both are on the increase.

CONDENSED SICK REPORT FOR JULY.

Mean strength	1,015
Dysentery	3
Intestinal disturbance	1
Intestinal fever	1
Intestinal intoxication	1
Diarrhea	174
Typhoid fever	11
Remittent malaria	27
Malaria	46
Intermittent malaria	3
Other diseases	161
Total	428

The August report is signed by Asst. Surg. Roy A. Wilson, without comment.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength	1,015
Typhoid fever.....	71
Malaria.....	226
Diarrhea.....	284
Gastritis.....	5
Enteritis.....	1
Indigestion.....	5
Other diseases.....	127
Total.....	719

The September report covers only the first three days of that month.

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength	1,015
Malaria.....	14
Gastritis.....	1
Typhoid fever.....	3
Diarrhea.....	58
Other diseases.....	15
Total.....	91

The study of this regiment is of special interest for two reasons. In the first place, it is one of the few regiments which there is reason to believe reached Chickamauga Park without bringing with it one or more persons already infected with typhoid fever. We say that this is probably the case. As has been stated, the different troops arrived during the last few days of May. The first probable case of typhoid fever occurred June 15. This man belonged to Troop E, which reached Chickamauga May 23. It is possible that this individual may have been a recruit and may have reached the park later, but there is no evidence that this was the case. We will therefore presume that this man came with his troop to Chickamauga May 23. Twenty-three days later he responded to sick call. His disease was first diagnosed diarrhea; subsequently it was changed to malaria. Apparently he remained sick in quarters from June 15 until July 26. On the last-mentioned date he was returned to duty, but five days later he was found to be sick again, and the record leaves the case incomplete; it only shows that he was still sick August 13. With this history it is almost certain that this was a case of typhoid fever and that the man became infected after reaching Chickamauga. The second point of interest attached to this regiment lies in the fact that the two camp sites occupied by it while at Chickamauga both became notoriously filthy. Our board inspected this regiment on its last camp site and can testify to the fact that not only were the sinks in a disgusting condition, but the woods around the sinks were so filled with fecal matter that it was almost impossible to walk through them without soiling the feet.

As has been stated, the first probable case of typhoid fever had its initial date June 15. There were 2 cases June 20, 1 June 21, 1 June 22, 2 June 23, and 1 June 25, making 8 cases in all for the month of June. For July there were 96 cases, and in August 156. During the first few days of September, when the regiment was preparing to move, there were 9 cases. In addition to these there is one case for which no date is given, making in all 270 cases of probable typhoid fever in this regiment up to the 8th of September. It is true that this number is not so large as that furnished by certain other regiments, but we regard this regiment as furnishing a valuable history for the reasons already given.

SUMMARY.

Assembled at points in Montana, Idaho, and the Dakotas in April and May, 1898.

Mustered into United States service from May 10 to 20, 1898.

Arrived at Chickamauga Park, Ga., in detachments, from May 23 to 30, 1898.

Strength on arrival, 1,004.

Date of first case of probable typhoid fever, June 15, 1898.

Date of first case of recognized typhoid fever, June 23, 1898.

Left Chickamauga Park September 10, 1898.

Strength on departure, 1,013.

Number of cases of probable typhoid fever developed at Chickamauga..... 270

Disbanded after leaving Chickamauga.

Number of cases of probable typhoid fever reported after disbanding..... 0

Total number of cases of probable typhoid fever developed in the Third United States Volunteer Cavalry from May to September, 1898..... 270

These 270 cases were diagnosed as follows:

Typhoid fever.....	103
Malaria.....	119
Diarrhea.....	47
Dysentery.....	1
Total.....	270

The following is an alphabetical list of total deaths in this regiment so far as we have been able to ascertain:

Name.	Rank and company.	Date.	Place of death.	Cause of death.
Bahler, Christian.....	Pvt., D.	1898. July 11	Camp Thomas, Ga....	Cerebro-spinal meningitis.
Beech, Algernon J.....	Pvt., B.	Sept. 21	Champion, Mich.....	Typhoid.

Williams, W. R.....	Pvt., A.	Oct. 20do.....	Do.

Total deaths..... 15

Deaths due to typhoid fever..... 13

Percentage of deaths among probable cases (270) of typhoid fever, 4.81.

Percentage of deaths among recognized cases (103) of typhoid fever, 12.62.

FIRST ILLINOIS VOLUNTEER CAVALRY.

The first report from this regiment covers the period from May 21 to May 31, inclusive. Major Culbertson, in charge, makes the following statement:

The First Illinois Volunteer Cavalry was mustered into service May 21, 1898, at Springfield, Ill. The command, consisting of headquarters and twelve troops, officers and men, left Camp Tanner May 30 and arrived at Camp George H. Thomas June 1. During the stay of the regiment at Camp Tanner, owing to the inclement state of the weather, a number of cases of pneumonia and meningitis presented themselves. Three cases were left at St. John's Hospital, Springfield, Ill., in charge of Lieutenant Bellau of the Twelfth Infantry and Dr. G. M. Kreider of the Illinois National Guard.

This report includes fourteen cases, none of which could possibly be typhoid fever. There are two cases diagnosed as intestinal toxemia; one of these was off duty two days and the other for one day. The mean strength is given in this regiment as 1,027.

The June report is signed by Acting Assistant Surgeon Robeson, who makes the following statement:

Most of the sickness has been due to diarrhea and dysentery. One case of typhoid fever was taken to Leiter Hospital. One case of appendicitis was operated upon by Dr. Nicholas Senn and died on the third day after the operation. There is no malaria or infectious disease present.

CONDENSED SICK REPORT FOR JUNE.

Mean strength	1,255
Acute diarrhea	112
Intestinal toxemia	18
Malarial fever	1
Typhoid fever	1
Other diseases	157
Total	289

We are again called upon to observe that there is a contradiction between the statement of the surgeon and the details of his report. As has been seen, he states that there is no malaria or any other infectious disease present, while his report gives one case of malaria and one case of typhoid fever.

It is an interesting fact that during the first ten days of this month the cases of diarrhea and intestinal toxemia were of very short duration, none of them lasting more than three days. On June 10 there occurs a case of intestinal toxemia which continued for eleven days; on June 11 a case of diarrhea which continued for eleven days, and another of the same disease which continued for thirteen days. After this there are several cases of diarrhea of from six to ten days in duration. The case of recognized typhoid fever occurred on June 20. It was first diagnosed as "chills and fever." The patient was a private of Troop G. This man was transferred to Leiter Hospital June 28 and died on the same day.

The July report is signed by Major Robeson, with the following statement:

The prevailing diseases in camp are diarrhea, typhoid fever, and malaria. The malaria is mostly of the remittent type. The diarrheas are decreasing, the typhoid fever is increasing. The cause is not known.

CONDENSED SICK REPORT FOR JULY.

Mean strength	1,241
Intermittent malaria	2
Remittent malaria	3
Acute diarrhea	104
Intestinal toxemia	22
Typhoid fever	11
Other diseases	145
Total	287

The August report is signed by Major Robeson, with the following statement:

The regiment was at Camp George H. Thomas, Chickamauga Park, Ga., until August 25, when it departed for Fort Sheridan, Ill., arriving August 27. The hospital train left Camp Thomas August 25, reaching Fort Sheridan at 2 a. m., August 26, with 132 patients, 20 attendants, a surgeon, and an assistant surgeon.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength not given.	
Intermittent malaria	20
Remittent malaria	126
Acute diarrhea	89
Intestinal toxemia	1
Typhoid fever	52
Undetermined fever	38
Other diseases	91
Total	417

This regiment was furloughed by special order September 5. The difficulty of obtaining accurate information from sick reports is well illustrated by the records of this regiment. In the August report every case of remittent fever is marked "quartan," while the intermittent malarias are marked "tertian." In the September report this nomenclature is reversed, the remittent malarias are marked "tertian" and the intermittent "quartan." Most of the cases of typhoid fever found in the September report have been brought over from previous reports. There are no comments by the surgeon upon the September report.

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength	1,209
Intermittent malaria	106
Remittent malaria	35
Acute diarrhea	10
Typhoid fever	33
Dysentery	1
Other diseases	30
Total	215

We have tabulated 220 cases of probable typhoid fever in this regiment. These are distributed through the months as follows:

June	2
July	37
August	159
September	22
Total	220

SUMMARY.

Assembled at Camp Tanner, Springfield, Ill., in April and May, 1898.

Mustered into United States service May 21, 1898.

Arrived at Chickamauga Park, Ga., June 1, 1898.

Strength on arrival, 1,255.

Date of first case of probable typhoid fever, June 10, 1898.

Date of first case of recognized typhoid fever, June 20, 1898.

Left Chickamauga Park, Ga., August 25, 1898.

Strength on departure, 1,299.

Percentage of deaths among recognized cases (68) of typhoid fever, 23.53.

COMMUNICATIONS FROM THE SURGEONS OF THE FIRST ILLINOIS VOLUNTEER CAVALRY.

Medical officers.

Jay Robeson, major and surgeon, Chicago, Ill.

Jesse Rowe, captain and assistant surgeon, Chicago, Ill.

Albert E. Mowry, lieutenant and assistant surgeon, Chicago, Ill.

Captain Rowe states:

The First Illinois Volunteer Cavalry was first encamped on the Illinois State fair grounds at Springfield. About the time of our being mustered into service we occupied what was known as the "Manufacturing building," these quarters having been recently vacated by the Third Infantry. This latter regiment, I understood, had two cases of cerebro-spinal meningitis here, and our regiment developed two cases of the same malady also. Our water supply at Springfield was excellent, and all sewage was carried away through the city sewerage system. We had no cases of typhoid fever here.

We started for Chickamauga May 30. Arriving at our destination, we were first encamped in the timber lands adjoining the Brotherton field. The second day after our regiment was settled, while bathing in Chickamauga Creek, just below the intake pipes of the pumping station, I saw fecal masses floating on the surface of the stream. Our water supply was furnished from this creek, and we were told that the water was well suited for drinking purposes. I do not know who was responsible for the order designating the source of our water supply, but it came from general headquarters. As soon as the true condition of things was discovered our men were ordered to discontinue the use of this creek water, and our supply was hauled from Crawfish Spring and the springs at Rossville. A supply was also obtained from the springs 3 miles east of camp. The first men affected by typhoid admitted having drunk water from the pipes when they were out with the horses and thirsty. The pipe water was always muddy and turbid and had a distinctly bad flavor after we arrived in camp, although I understood it had formerly been very clear, but on account of the recent rains a great deal of foreign matter had been washed into it.

Another source of our drinking water was bored wells. The water from these wells was very clear and of good flavor, but after the rains it was very muddy, full of sand, and at times had a distinct odor. The surface of the ground was very hard and compact, having substratum of rock, which seemed to carry the water in distinct channels direct to the wells. Fecal matter was distributed indiscriminately throughout the timber to the north of the camp and in most places where there were no special guards stationed throughout the grounds. At times it was almost impossible to walk through the timber without coming in contact with these insanitary evidences. It was no unusual thing after a heavy rain for the sinks to be entirely overflowed; and as little streams became raging torrents at these times, this fecal matter was left in masses high and dry along the course of the streams and oftentimes 25 or 50 feet from their bed. I am confident that this fecal matter was carried directly to the source of the water supply of the wells, and the sinks being left open gave free access to the flies, which were very annoying, and, together with the flying particles of dust raised by the horses during drill maneuvers, contributed not a little to the general insanitary condition. Later these sinks were covered with dirt each time after being used.

While riding through the country south of our camp I interviewed a number of farmers and old residents, and learned from them that typhoid fever had been prevalent in the country above our camp drained by the Chickamauga Creek; that they had thrown fecal matter indiscriminately on the ground, in one instance in the barn lot. These things took place in the fall preceding our encampment. Notwithstanding these disgusting practices, we were repeatedly assured that Chickamauga Creek was bacteriologically pure.

I will add that the officers of the headquarters mess received their water supply direct from the McDonald springs, at Rossville, and that there were no cases of typhoid fever among these men, although a large number of cases developed among the attendants at the hospital.

Our regiment afterwards moved into the Brotherton field, an open space adjoining the timber where we were first camped. Here large drainage ditches were dug along the troop streets, and

a considerable number of very mild cases of malaria developed during a period of about two weeks. None of these cases were severe, however, and yielded readily to treatment.

In attempting to locate the source of the typhoid infection at this encampment, I am convinced that Chickamauga Creek was a fertile breeding ground for the disease, the swarms of flies, the impure water of the wells, and the flying particles of dust contributing their not insignificant part to the general deplorable, not to say damnable, condition.

Lieutenant Mowry writes the following:

Our hospital corps was composed of eight graduates in medicine and the rest were advanced medical students from Chicago medical colleges. With this class of men we were enabled to do considerable scientific investigation, especially in the matter of blood examinations. During the first six weeks at Chickamauga we had but few cases of typhoid fever. The camp was carefully policed and all possible means taken to prevent any spread of infection. The tents were taken down once each week and the sun allowed to thoroughly dry all the tent floors. The water supply was watched carefully to avoid any contamination. The troops were required to keep the water barrels clean. The water supply at Chickamauga was watched closely, and the drinking water was, for the most part, hauled from Crawfish Spring, which appeared to be an ideal water supply. Some small quantity of the water was secured at near-by springs, which were apparently good.

The typhoid epidemic in our regiment began soon after Grigsby's Rough Riders changed their camp to a point adjacent to our camp. The sanitary conditions of their regiment were not watched so closely as in ours. From personal observation I believe that the fever epidemic was due much more to flies than to the water. Not enough care was taken to see that the sinks were covered with earth at intervals frequent enough, and although we constantly ordered a large amount of lime to disinfect the sinks there was but little furnished us. For instance, Major Cuthbertson tried very hard to have the medical department allow us 12 barrels of lime at one time. We finally got 1 barrel after repeated futile attempts to secure the desired amount. There was a marked carelessness or indifference on the part of the medical officers in charge of the entire camp in the matter of giving us proper disinfectants for the sinks. The flies were very numerous, beginning about the middle of July, and a piece of bread would be covered with flies and fly deposits if allowed to remain for a minute or two. Where the men's tables were protected by mosquito netting there was little or no typhoid contracted, while mess tables not so protected were fertile sources of infection. The sinks were too close to the camps and were a mass of flies and maggots.

There was but little malaria in our regiment, and doubtful cases in nearly all instances proved to be typhoid when tested by the Widal test. It is my firm conviction that the water supply at Chickamauga was, for the most part, excellent, as most of it came from a spring that seemed to come out of solid rock and which was some distance from any regiment. The sinks should have been at least one-eighth of a mile from the camp, and should have been thoroughly disinfected with lime each day and covered over with dirt at least twice a day. The regiments should have been scattered farther from each other. I do not remember of a single officer in our regiment having contracted typhoid where protection to their mess tables was made against flies, while several officers who ate at tables not so protected contracted the fever. Had time and chance permitted, I should have liked to have examined the legs of flies found on the tables and ascertained if they did not have attached to them masses of fecal matter which were full of typhoid bacilli.

FIRST OHIO VOLUNTEER CAVALRY.

We are indebted to Major Bunts, surgeon of this regiment, for the following facts pertaining to its history:

This regiment assembled at Columbus, Ohio, and was mustered into the service of the United States May 9, 1898. While at Columbus the drinking water used was from two wells. One of these was deep and the other shallow. The men were instructed not to use the water from the shallow well, but they did so. The water from this well was not above suspicion, and none of the water used at Columbus was boiled. Fecal matter was disposed of in sinks, the contents of which were covered each day. Major Bunts reports that there was no illness in the command during its stay at Columbus.

This regiment left Columbus, Ohio, May 13, and arrived at Chickamauga Park, Ga., May 15. It encamped on the Dyer field, quite removed from all other commands. The regimental camp was located in an open field. Water at this place was obtained from driven wells, and occasionally it was hauled from Crawfish Springs. One of the wells was soon condemned, as it was believed that it would be likely to be contaminated on account of its location. Sinks could not be dug, as a rule, more than 3 feet deep. In some places they were carried down to a depth of 5 feet. The location of sinks was more than a quarter of a mile from the wells that furnished drinking water.

The first case of typhoid fever appeared May 30. Major Bunts is quite confident that the initial date of this case should be earlier, because the man had been complaining for some days. This was an unmistakable case of typhoid fever. He was kept in the regimental hospital until June 30, and was then transferred to Leiter Hospital.

Early in July about twenty cases of typhoid fever developed suddenly in Troop H. Major Bunts explains this outbreak as follows:

This troop had its picket line on the Snodgrass place, about one-half mile away from the other picket lines. Here the men found a small pump located in a ravine not far from the place where the observation stands were erected at the time of the dedication of the park two years before. Troop H, finding this little pump and being pleased with the taste of the water obtained from it, used water from this source largely. They endeavored to keep the knowledge of this source of water supply from the other troops. Orders had been issued forbidding the use of water from these shallow wells.

While Troop H suffered most severely at Chickamauga, no troop of this regiment wholly escaped typhoid fever while there.

On July 13 this command left Chickamauga Park and went to Lakeland, Fla. On the journey and after arriving at Lakeland cases, especially from Troop H, continued to appear.

The water supply at Lakeland was taken from driven wells which were from 30 to 40 feet deep. The tubes for these wells were driven in the sand and did not pass through any impervious geological formation. Five cases developed in Troop H before leaving Chickamauga Park and 15 cases soon after reaching Lakeland. Major Bunts stated that in all there were 9 cases of recognized typhoid fever in the regiment during its stay at Chick-

amauga; but the study of the sick reports shows, as has been stated, that the number of cases was much larger than that given.

At Lakeland the camp was on a slightly elevated ridge between two lakes or swamps. The nearest of these was about 300 yards from the regimental lines and the other about a quarter of a mile distant.

This regiment left Lakeland, Fla., August 20, and proceeded to Huntsville, Ala. When this regiment left Lakeland 68 cases of typhoid fever remained in the hospital at that place. From the time of its leaving Lakeland to the date of our inspection of this command at Huntsville, September 7, 1898, 112 additional cases had developed, making up to that time 180 cases of typhoid fever, not including those left at Chickamauga when the command went to Lakeland. How much longer typhoid fever continued to develop in this regiment we do not know, as we have not gone over the sick reports of this command for this period.

The main features concerning typhoid fever in this regiment may be summed up as follows:

This command became infected with typhoid fever at Columbus, Ohio. It carried this infection to Chickamauga and possibly infected its water supply at that place. At any rate typhoid fever became quite prevalent, especially in Troop H, during the stay of this command at Chickamauga. It went to Lakeland, Fla., July 13, carrying with it many men already infected with typhoid fever. At Lakeland its water supply was obtained from a sand bed upon which the regiment encamped and in which its sinks were located. Occasional cases continued to develop at Lakeland and about August 5 the disease became widely prevalent. It is more than likely that the wells at Lakeland became infected and the 180 cases, developed in August at this place and at Huntsville, were due to the water infection at Lakeland.

SUMMARY.

Assembled at Columbus, Ohio, in April and May, 1898.	
Mustered into United States service May 9, 1898.	
Arrived at Chickamauga Park, Ga., May 15, 1898.	
Strength on arrival, 830.	
Date of first case of probable typhoid fever May 11, 1898.	
Date of first case of recognized typhoid fever July 4, 1898.	
Left Chickamauga Park, Ga., July 13, 1898.	
Strength on departure, 833.	
Number of cases of probable typhoid fever developed at Chickamauga.....	9
Number of cases of probable typhoid fever developed after leaving Chickamauga.....	180
<hr/>	
Total number of cases of probable typhoid fever developed in the First Ohio Volunteer Cavalry from May to September, 1898.....	189

The following is a list of deaths in this regiment:

- No. 1. Private of Troop F, died of typhoid fever at Lakeland, Fla., August 25, 1898.
 No. 2. Private of Troop F, died of typhoid fever at Lakeland, Fla., August 30, 1898.

No. 3. Private of Troop D, died of typhoid fever at Huntsville, Ala., September 4, 1898.

No. 4. Corporal of Troop F, died of typhoid fever at Lakeland, Fla., September 5, 1898.

No. 5. Private of Troop G, died of typhoid fever at Huntsville, Ala., September 7, 1898.

No. 6. Private of Troop C, died of typhoid fever at Huntsville, Ala., September 16, 1898.

No. 7. Private of Troop F, died of typhoid fever at Eaton, Ohio, while on furlough, September 23, 1898.

This command consisted of eight troops and had a maximum strength of 866, besides civilian employees. There were about 189 cases of typhoid fever, so far as we can learn, in this command.

Total deaths 7
 Deaths due to typhoid fever..... 7

Percentage of deaths among probable cases (189) of typhoid fever,^a 3.70.

COMMUNICATIONS FROM THE SURGEONS OF THE FIRST OHIO VOLUNTEER CAVALRY.

Medical officers:

Frank E. Bunts, major and surgeon, Cleveland, Ohio.

Charles H. Castle, captain and assistant surgeon, Cincinnati, Ohio.

Major Bunts has furnished us with the following notes after reading our history of this regiment:

(1) The case which had its probable origin in Columbus was in B Troop, situated seven troop streets from H Troop. This man was put into the hospital a few days after our arrival at Chickamauga, and in no way could have contaminated the water supply of H Troop, which was far removed from all others.

(2) It should be known that our regimental camp at Lakeland, Fla., was just across the road from the camp of a portion of the First United States Cavalry and that several deaths had already occurred in that regiment before we arrived. Flies were very abundant in this camp.

(3) I am not sure that all of the 112 cases were genuine typhoid. Aside from about 40 of our worst fever cases that were taken care of at the regimental hospital at Huntsville, most of the cases that were sent to corps reserve hospital or sent home were marked "continued fever," as they were transferred immediately upon discovery of fever and before a positive diagnosis could be made. Many of these cases I learned afterwards proved to be genuine typhoid fever, though a few turned out to be less serious.

(4) The date of the first case of typhoid fever is improperly given. Private Teeple, of B Troop, was taken ill with this disease about May 30 and was transferred as a convalescent to Leiter Hospital. While it is possible that Teeple contracted typhoid fever at Columbus, thirteen days passed after leaving that place before he was taken ill.

Captain Castle has furnished us with quite a complete history of this regiment, from which we make the following excerpts:

In the first place, Captain Castle complains because the examination of the recruits was simply perfunctory and many men were allowed to enlist who did not physically comply with the requirements. Men under weight, some with deformed feet, and some with hernia were accepted. At the State encampment at Columbus

^aIt is quite certain that we have not a full report of deaths in this regiment.

there was a mild epidemic of catarrhal conjunctivitis. One case of pneumonia developed on the way from Columbus to Chickamauga. This man was a civilian employee, and was immediately transferred to the hospital attached to the headquarters of the commanding general. He made a speedy recovery, and this was the only case of fibrinous pneumonia developed in this regiment. The ground assigned to this regiment at Chickamauga was most excellent. It sloped in many terraces from a wooded ridge and spread out bare of trees and carpeted with close turf, which scarcely concealed the red clay beneath. In clear weather the sun kept the camp sweet and clean and in rainy weather the water drained off rapidly into a small run between the camp and its sinks.

I believe that in this encampment of instruction at Chickamauga regimental commanders and general officers must have learned that a plain, even under a blazing sun, is better for the health and comfort of the soldiers than the woodland.

During the first ten days at Chickamauga the medical department had two difficulties to contend with. One was the delay in furnishing the troops with fresh beef and keeping them on the travel rations until their hitherto untried digestions were thoroughly upset. Second: Procuring hospital tents.

About May 20 our first case of typhoid fever developed. This soldier had arrived at Columbus, Ohio, from his home in Zanesville, Ohio, and had left the regiment on May 14, arriving in Chickamauga May 15. This history locates the place of infection at Columbus. The date of infection of this was May 11, and was therefore an imported case. I believe that a search through the regimental records for the months of May and June will show that many cases were brought to the camp from the large cities in the country. The diagnosis in this case was made early. It then pursued a typical course of moderate severity, and precautions were taken against the spread of the infection from the hospital sink, but unfortunately it was not as far from the hospital as it should have been; this was due to the "lay of the land." It was sunk 7 feet deep in very hard clay, and its contents could not contaminate any neighboring water supply. Fresh earth was thrown in every morning and not infrequently a coating of chloride of lime was added. When approaching the surface the pit was filled in, a similar sink dug close at hand, and the shelter moved to cover it. The probability of contagion being conveyed on the feet of flies, however, has some weight added to it by a case developing among our hospital attendants in the early part of July, and we sent our first case to the Leiter General Hospital. The water of the well from which the last man habitually drank was not known to have caused another case of typhoid fever, whereas the possibility of flies from the hospital sinks reaching the dining tables was not at all remote. The health of the command in the month of June and the early part of July was excellent, the average in hospital being about 6, and most of these were digestive disturbances. We saw no malaria, and from my knowledge of the park I do not believe that this disease prevails there. However, during the second week in July a fever of severe and pronounced type made its appearance. Four out of the five cases of this disease occurred in Troop H.

This troop had its picket line at the opposite side of the camp from the other seven troops, and near the isolated picket line was the platform from which the park dedication ceremonies had been held two years before, and close to this, in the bottom of a hollow which drains the hillsides, was an old well with a pump. These dedication ceremonies had been attended by several thousand people, mostly from the cities of Ohio, Kentucky, Indiana, Illinois, and from various parts of the South. Typhoid fever being endemic in practically all cities, wherever several thousand people come to-

gether there will be among them many incipient cases of this disease. The rains and snows of two years had probably collected in the well the infective material deposited near by at the time of the dedication service. Water was so difficult to get that the finding of this well by Troop H was regarded as a "snap" and so kept secret. I believe that the water from this well was infected and caused typhoid fever.

When this regiment started for Florida all cases of typhoid fever were sent to Leiter Hospital, but others developed during the journey.

At Lakeland the camp was pitched in a pine grove. Trees were tall, covered with moss, and sparsely scattered over the ground, so as to admit a fair amount of sun. The ground was covered with a thick carpet of pine needles, which, until they had been removed, retained much moisture from the two or three showers that never failed. This excess of moisture made the first few days in this camp seem like living in a steam bath. However, this condition was improved by clearing off the ground and enabling the sun to dry it out. We reached Lakeland with 5 cases of typhoid fever, 2 in delirium; 1 case of simple continued fever; 1 case of acute articular rheumatism, and 1 case of orchitis.

Notwithstanding the abundance of water (for there were sixteen lakes in the vicinity of Lakeland) the water question was a most serious one. Overlying the coral reef, which forms the rocky foundation in this part of Florida, is a bed of clay, and over this again forms a surface soil of sand of variable depth. In the hollows and small valleys where the sand is not piled too high lie the lakes, and everywhere under the sand is this surface water on a level with the water of the lakes and undoubtedly making one large body of water, parts of which are concealed and parts exposed. Daily showers wash the surface sand ridges into the lakes and through the sand into the subterranean basins. Daily evaporation under the semitropical sun prevents the ground from being inundated. We tried in several places to drive wells on higher ground in and about the camp, but here we could get nothing except wet sand, and the pumps speedily choked, and finally we were compelled to approach within 200 feet of the lake, where finally a well driven 28 feet deep gave us a free flow of water. This water was to be boiled before being used for drinking purposes, and the troops kept tubs of boiled water standing in convenient places in the troop streets constantly. But it seems next to his bravery the one distinctive characteristic of the American soldier is his aversion to boiled water and his determination never to drink it under any circumstances. About the officers, most of them had quantities of boiled water which they consumed in the form of iced tea, coffee, cocoa, soups, and we shall see presently that the percentage of sickness was very small. For ten days following our arrival at Lakeland we received one daily addition of typhoid fever. All of these cases were infected at Chickamauga, and the disease ceased to develop as we reached the limits of the period of incubation.

On July 18 we received 2; July 19, 2; July 20, 2; July 22, 3; July 23, 2; July 24, 1; July 25, 2; July 26, 2.

Captain Castle is of the opinion that typhoid fever from the Chickamauga infection ceased July 31 and the epidemic from Lakeland infection began August 1. He states:

On August 1 we had 18 cases in hospital; on August 7, 23 cases; on August 10, 32 cases; on August 15, 39 cases; on August 18, 60 cases; and on August 21 (the day after the regiment left for Huntsville, Ala.), 70 cases.

When the regiment left Lakeland for Huntsville an attempt was made to retain all the sick, even suspicious cases, but the men were so anxious to get away from Florida that when the regiment arrived at Huntsville it

was found necessary to send more than twenty patients immediately to the hospital.

In speaking of the Lakeland cases, Captain Castle states:

A very large proportion of the cases—fully two-thirds—presented themselves at sick call with flushed faces and suffused eyes, bounding pulses, coated tongues and anorexia, nausea, usually diarrhea, intense headache, and backache. Most of these men stated that they had been sleepless for one or two weeks preceding. They showed diffused tenderness over the abdomen and had a temperature of from 103° to 105° F. There was a history of sudden onset of headache and backache, usually with a chill. Placed in cots in the hospital and fed on milk with small doses of acetanilid and soda to settle the stomach, a large number of these cases was vastly improved at the end of forty-eight hours. The temperature dropped, sometimes almost to normal. Some little sleep was obtained and the abdomen was less tender and there was less headache and the patient evidently felt better. In short the clinical picture was that the disease set in suddenly with apparent febrile symptoms and marked gastric disorder, vomiting sometimes of a bloody material, and albuminous urine, and this was close enough to Osler's description of yellow fever. Therefore, I thought it best to call for a consultation with an expert in the diagnosis and management of the disease.

I made a statement of the case by mail to the chief surgeon of the corps and in a few days Passed Assistant Surgeon Glennan, of the Marine Hospital Corps, was sent to inspect our sick. He pronounced our cases typhoid fever. He assured me he would rather have yellow fever than the type of typhoid fever seen in the various camps that he had inspected. He denied that I could find a good published account of yellow fever, and gave graphic descriptions of the diagnostic points that I do not believe I will forget. After this preliminary puzzling outbreak of the disease all of the cases settled down into the dreary monotony of continued fever and exhaustion which we know so well. Undoubtedly one of the causes for the widespread epidemic of typhoid fever was to be found in the condition of the intestinal tract of most of the soldiers, and this condition was not so frequent among the officers as it was among the enlisted men. This condition was a subacute or chronic intestinal indigestion and diarrhea, and officers and men were subjected to the same condition as regards climate, clothing, and the general hygienic surroundings. The officers were not so crowded in their sleeping quarters. They were not subjected to the hard manual labor that the men frequently were, and were not compelled to eat army rations, but had to supply their table at their own expense. We have seen in this particular regiment the men drank unboiled water and the officers drank boiled water, but there was probably something more than this that was an active factor in the prevalent diarrhea. I have been long of the opinion that the bacon furnished to the Army is absolutely unfit for human food. Villainous to the taste organs of most civilized people, if not impossible of digestion, and clearly of small nutritive value, as we see by studying those who make it a staple of diet.

We never used any of the canned roast beef that has produced such a controversy. As for the refrigerated beef, it was very difficult to keep, and decomposition with the formation of ptomaines sometimes took place in an hour or so.

Our first death occurred August 25, and resulted from shock due to perforation. The second death occurred August 31, and was due to typhoid toxemia. Petechiæ were almost universally distributed subcutaneously. The urine became smoky and finally there was complete suppression. There were intestinal hemorrhages, followed by coma. The third fatal case developed submaxillary abscesses, followed by septic symptoms. Another case promised a fatal result from profuse hemorrhage, but copious hypodermoclysis and long-continued narcotism I believe saved his life. More or less copious intestinal hemorrhage occurred in fif-

teen cases. In quite a number of cases that recovered the temperature ranged as high as 105° and 106° F. on several occasions. Delirium was quite a frequent accompaniment of the disease. Thrombosis of the veins of the lower extremities occurred in only two cases that I know of.

The treatment of these cases was simple. The patients were lying under the awnings in the open air, for the walls and flies of the tents were never dropped unless during the drifting rains, and then only on the side toward the rain, to be raised as soon as the sun shone again. Sponge baths were given for temperatures of over 103.5°. Bismuth was administered for diarrhea. Injections were employed for constipation. Strychnia was administered for asthenia and failing heart. Whisky was given as a food and as a stimulant.

In regard to the condition of the regiment on and after its arrival at Huntsville, Major Bunts has furnished us with the following statement:

I reached Huntsville a day in advance of the regiment, and, fearing that some might be taken sick on the way, I rented a large room in one of the hotels and bought cots, pillows, sheets, etc., enough for half a dozen patients, intending later to establish a regimental hospital out in camp. As the different sections of our train began to arrive I found that everything pertaining to the medical service, except two privates in the hospital assignment, one of whom was then under arrest, and an orderly's pouch full of medicine and one ambulance, had been left at Lakeland. The men getting off the train seemed spiritless and disheartened. Many of them threw themselves and their accouterments upon the ground and lay there until picked up by wagons hired by Doctor Izler, the assistant surgeon, and myself. The men staggered up the street and reached the hotel, and in a short time the room and beds that I had provided were filled to overflowing.

Having no tents, and realizing the immediate necessity of providing shelter and caring for the sick, I succeeded in renting a brick house and getting it cleaned and scrubbed, and I purchased cots and bedding, arranged for a supply of milk, hired a cook, secured volunteer nurses from our ranks, and by 10 o'clock that night we had established a regimental hospital, thereafter known as the Ohio Hospital, with 43 patients. Most of the cases at the hospital were pronounced typhoids, a few genuinely malarial, and one or two pneumonias. The type of fever seemed to be severe. Hemorrhage from the bowels, phlegmasia alba dolens, gluteal abscess, hemorrhoids, acute cystitis, and acute nephritis were among the complications. As a matter of interest I may add that one of the convalescents sent from Lakeland developed a relapse upon attempting to join the regiment for muster out. He narrowly escaped dying. Orchitis developed during his first convalescence, became suppurative, and necessitated an operation. I had a culture made from the pus, and it was found to contain a practically pure culture of the typhoid bacillus. Three deaths occurred during our stay at Huntsville. All of these were typhoids, and all were complicated by violent intestinal hemorrhage.

In looking over my records I find that our sick reports show from the time of our enlistment to the date of discharge that we cared for 65 cases of malaria, 88 cases of typhoid fever, and 150 cases diagnosed as continued fever. Many of the latter became pronounced typhoids while under our care at Lakeland and Huntsville. I also heard of many others after the regiment was mustered out of service, and nearly all of these were cases of typhoid fever. I think some of the cases diagnosed as malaria proved to be typhoids later.

I do not think that a case of typhoid fever developed in our regiment after reaching Huntsville that was not infected at Lakeland. When the regiment left Huntsville for home the health of those still remaining had greatly improved. About eight were still in hospital, too sick to be moved, and were left in care of Doctor Izler.

Major Bunts thinks that transportation by the hospital trains was in several instances dangerous to the lives of patients. On this point we quite agree with him.

TYPHOID FEVER IN THE LIGHT ARTILLERY BRIGADE OF
THE FIRST ARMY CORPS.

LIGHT ARTILLERY BRIGADE OF THE FIRST ARMY CORPS.

Battery.	Arrived at Chickamauga.	Left Chickamauga.	Strength on leaving.	Total deaths.	Deaths from ty- phoid.
Battery A, Illinois.....	May 21	July 24	175	2	2
Twenty-seventh Indiana Battery	May 16	July 24	173	0	0
Twenty-eighth Indiana Battery..	May 16	Sept. 3	177	1	1
Battery A, Missouri.....	May 18	July 24	171	4	3
Batteries A, C, G, and H, Ohio....	May 17	Sept. 5	697	11	9
Battery B, Pennsylvania.....	May 18	July 24	176	1	1
Batteries A and B, Georgia.....	June 8	Sept. 4	324	2	1

Total strength of the Light Artillery Brigade.....	1,893
Total deaths in this brigade	21
Deaths due to typhoid fever	17

Supposing that the deaths from typhoid fever represent 7 per cent of total cases of typhoid fever, then this brigade would furnish about 242 cases of typhoid fever.

Troop H of the Sixth United States Cavalry and Company F of the Eighth United States Infantry acted as provost guard and headquarters guard at Chickamauga. Both of these organizations arrived at Chickamauga April 20. Troop H left July 23. We have not been able to ascertain the date when Company F of the Eighth United States Infantry left. Troop H numbered 65 and Company F 59 men. Two deaths from typhoid fever occurred in Troop H. We have not found any record of death from any cause in Company F.

TYPHOID FEVER IN THE SIXTH UNITED STATES
VOLUNTEER INFANTRY.

Special interest attaches to this regiment because it came into Chickamauga Park at a time when typhoid fever widely prevailed at that place. Although this command possibly brought the typhoid infection with it, it brought into the midst of a fearfully polluted and highly infected place a large number of men susceptible to the disease, and it will be interesting to ascertain the effects produced.

This regiment assembled at Knoxville, Tenn., where it was mustered into the service of the United States July 14, 1898. It remained in camp near Knoxville, at Camp Walter, until July 31. While encamped at this place it had a most excellent supply of water—that furnished West Knoxville. Fecal matter was deposited in sinks, which were fairly well policed, the contents being covered with dirt and lime twice a day. The health of the command seemed good, but soon a case of typhoid fever appeared. Very shortly after the regiment had been mustered in, one man, an athlete, who had been traveling about the country, complained of being ill and was granted sick furlough. This case

proved to be one of typhoid fever. This is another illustration, if we needed any more to convince us, that it is almost impossible to get together a regiment of volunteer soldiers without having among the men one or more infected with typhoid fever. This command reached Chickamauga Park about 11 o'clock on the night of July 31. They rested for the night near the Second Brigade of the Second Division of the Third Army Corps. The next morning they were moved near the water tower, upon ground quite remote from any occupied at the time or previously by any command. An interesting question arises here as to whether or not the one case furloughed from Knoxville was the only man in this regiment infected with typhoid fever. On the morning of August 1 eight men reported at sick call, but none of these proved to be serious. At first water was hauled from Blue Spring. Later an attempt was made to filter Chickamauga Creek water through the Berkefeld filter, but, as had happened in other regiments, the filters soon became clogged and were broken. After this they again obtained water from Blue Spring, and continued to do so as long as the regiment remained in the park.

It will thus be seen that the use of water in this regiment was limited to two sources—the piped water from Chickamauga Creek and that obtained from Blue Spring. Theoretically, all the water obtained from Chickamauga Creek was filtered; practically, this was not the case, and doubtlessly many men drank unfiltered Chickamauga Creek water. There was plenty of room about the camp; sinks were dug at a distance of more than 100 yards from the nearest tents; they had an abundance of lime, and apparently the greatest care was exercised. We have studied the records of this regiment very carefully and we find no evidence of typhoid fever in it after it reached Chickamauga until August 24, when a private from Company C was sent to the hospital of the First Division of the Third Army Corps. This case was diagnosed "malaria," and the man remained in hospital only five days, when he was discharged on furlough; but at the expiration of his furlough he was unable to return to his regiment. In all probability this was a case of typhoid fever. On August 27 another case of so-called malaria was sent to the same hospital and was furloughed four days later. Again, this man was not able to return when his furlough expired. From September 1 on, numerous cases of recognized typhoid fever were sent to Sternberg Hospital. One man admitted to Sternberg Hospital September 1 died September 5, and was probably in the second week of the disease at the time of death. This man was a sergeant and had never failed to appear at sick call in the morning with the men from his company and his company book. He expressed some solicitude about himself two days before he was sent to the hospital, or to be more explicit, on August 29.

From August 24 to October 4, the date when this regiment left Chickamauga, 98 cases of protracted fever were sent from this command to Sternberg Hospital. Eighty-six of these were diagnosed as typhoid fever, 11 as malaria, and 1 as dysentery. The man who was admitted to hospital September 1 and died September 5 was the first case of recognized typhoid fever occurring in the regiment after it reached Chickamauga. The appearance of this case caused considerable solicitude and the regiment again changed its location and its water supply.

The site selected this time was one of the best in the park, and the water was obtained from Mullis Spring, supposed to furnish an excellent water. However, as has already been seen, typhoid fever did not abate. During the month of September the total sickness in this regiment was not great. On the day that we inspected this command, 56 men presented themselves at morning sick call. Some of these were undoubtedly cases of typhoid fever, the others were intestinal ailments, mostly due to indiscretions in diet. Colonel Tyson of this regiment is a graduate of West Point and a man of large experience in the Regular Army. He was especially solicitous that his men should not acquire typhoid fever; discipline was as good as possible in a recently recruited regiment; the men were abundantly supplied with most excellent rations; the canteen was a dry one and permission to leave camp was seldom granted; the men purchased cots. The following, taken from our stenographic notes, indicates the condition in which we found this regiment:

Company sinks in best condition of any regiment at Chickamauga, but still with considerable fecal matter exposed and a good many flies around. Location, about 100 yards from mess tents. The regimental hospital is situated to north of regiment about 200 yards; the Mullis Spring intervenes. This spring is large and gives an ample supply. However, it is not as fully protected from possible contamination as it should be.

In our opinion the history of this regiment is exceedingly interesting in connection with the study of typhoid fever at Chickamauga. The records convince us that, although one case of typhoid fever had appeared at Knoxville, no other individuals in the regiment had been infected at that place. This command undoubtedly reached Chickamauga Park free from typhoid infection. More than usual care was exercised in order to protect it against this infection, the prevalence of which was at that time well known and thoroughly dreaded. Notwithstanding all the precautions taken, typhoid fever appears after the regiment has been at this place for three weeks, and within the next ten days develops into an epidemic, and within a little more than a month this command sends 86 cases of typhoid fever to the hospital. How did these men get their infection? This is an interesting question, and we wish we could answer it with certainty. However, it is

more than probable that they received this infection in diverse ways. Whether or not the general water supply of Chickamauga Park was infected we propose to discuss later, but suffice it to say, at present, that this was possibly a source of infection in this regiment. In the second place, details from this regiment acted as guards at Sternberg Hospital, where they came in contact with infected orderlies and most likely received food and drink from the hands of men whose business it was to dispose of the excretions of typhoid patients. In moving about the park in any direction whatsoever these men were likely to soil their feet with infected filth.

On the morning of October 6, 1898, this regiment broke camp and took train for Jersey City, N. J., arriving at this place on the evening of October 8. On the morning of October 9 it embarked on the transport *Mississippi* and sailed for San Juan, P. R., arriving on the morning of October 15, but not landing until the morning of October 17. Captain Massey states in his comments on the October report that no one reported sick during the voyage. It seems rather strange that a regiment which was daily sending one or more cases of typhoid fever to the hospital should on taking train at Chickamauga and going by train and boat to Porto Rico suddenly and absolutely cease to have any sick. If we could know positively that this statement is correct it would be a most interesting one. However, the statement is not true, as can be shown by the records of the surgeon that made it. He himself reports for the remainder of the month after leaving Chickamauga 17 cases of recognized typhoid fever. Two of these, according to the record, had their initial date on October 16, the others occurring from this time up to October 31. Now, it is certainly almost unbelievable that with one or more cases of typhoid fever occurring every day up to October 6, the date of leaving Chickamauga, there should have been no other cases until October 16, after the regiment had reached Porto Rico but before it had landed. Undoubtedly some of these men were not well during the voyage, but the records do not state this. Closer study of the records, however, shows that men were sick during the voyage. The following cases will illustrate:

No. 1. Company D: Continued fever, October 13; transferred to hospital at Arecibo October 31.

No. 2. Company E: Continued fever, October 15; transferred to hospital at Arecibo October 31.

No. 3. Company M: Continued fever, October 15; transferred to hospital at Arecibo without date.

Further than this the record will show that at least one man sick with continued fever (most likely typhoid fever) was carried from Chickamauga to Porto Rico. Indeed, the records show several cases of this kind.

No. 4. Company E: Continued fever, September 24; transferred to Arecibo October 19.

Moreover, another man is reported convalescing from typhoid fever October 26 and as being sent to the hospital at San Juan on that date as a typhoid fever convalescent.

Thirty-four cases of recognized typhoid fever occurred in this regiment from the time it reached Porto Rico up to December. The last case of recognized typhoid fever found in the December report had its initial date December 10. We do not mean to infer from this necessarily that typhoid fever disappeared after this time. We have not consulted records later than December. During the same time 94 cases of malaria were reported and 50 cases of intestinal disorders. We will not attempt to determine the exact number of cases of typhoid fever in this regiment. We think that the introduction of its history at this point has served a good purpose, inasmuch as it has shown that a regiment of susceptible men going into Chickamauga Park at a time when it was highly infected with typhoid fever within about three weeks became so badly infected that the disease prevailed in an epidemic form.

SUMMARY.

Assembled at Knoxville, Tenn., early in July, 1898.

Mustered into United States service July 14, 1898.

Date of first case of probable typhoid fever about July 21, 1898.

Date of first case of recognized typhoid fever about July 21, 1898.

Arrived at Chickamauga Park, Ga., July 31, 1898.

Strength on arrival, 1,017.

Number of cases of probable typhoid fever developed at Knoxville.....	1
Date of first case of probable typhoid fever after reaching Chickamauga, August 24, 1898.	
Date of first case of recognized typhoid fever after reaching Chickamauga, September 1, 1898.	
Left Chickamauga Park, Ga., October 6, 1898.	
Number of cases of typhoid fever developed at Chickamauga..	98
Reached San Juan, P. R., October 17, 1898.	
Number of cases of recognized typhoid fever developed during voyage.....	3
Number of cases of recognized typhoid fever developed after reaching Porto Rico	31
Total number of cases of typhoid fever developed in the Sixth United States Volunteer Infantry from July to December, 1898	133
These 133 cases were diagnosed as follows:	
Typhoid fever.....	121
Malaria.....	11
Dysentery	1
Total	133

COMMUNICATIONS FROM THE SURGEONS OF THE SIXTH UNITED STATES VOLUNTEER INFANTRY.

Medical officers.

Frank P. Robinson, major and surgeon, Greenville, Tenn.

Zachary D. Massey, first lieutenant and assistant surgeon, Sevierville, Tenn.

John W. Cox, first lieutenant and assistant surgeon, Bristol, Tenn.

Under date of July 19, 1899, Lieutenant Cox forwarded to us a communication, from which the following has been extracted:

My opinion is that the most potent causes of typhoid fever at Chickamauga was the great number of flies which alternately visited the privy vaults and the mess tents. Time and again I saw flies with lime on them fresh from the vaults.

After reaching Porto Rico our first camp was at Arecibo. Here we went into quarters October 17, 1898, and remained until February 11, 1899. At this place cistern water was used. We had pit, from 15 to 20 feet deep. There were but few flies, and the sanitation of this camp was superb. From about February 16 to March 15, 1899, we were at Camp Onward, Savannah, Ga., where the regiment was mustered out of the service. Here the city water was supplied and the sanitation was good. We had no typhoid fever after leaving Chickamauga, except among men who became infected at that place. There were about thirty of these, with four deaths. Allow me to suggest from my experience that in order to avoid an outbreak of typhoid fever in an army it is necessary to boil all water; after boiling it should be thoroughly cooled and should be drawn from the containers through spigots; all rations must be protected from flies by screens.

TYPHOID FEVER IN THE EIGHTH UNITED STATES VOLUNTEER INFANTRY

We are interested in this regiment because it went to Chickamauga Park a few days after the departure of the Sixth United States Volunteer Infantry, and because the claim has been made that this regiment had no typhoid fever at any time. For these reasons we will go somewhat minutely into its medical history.

The Eighth United States Volunteer Infantry consisted of a regiment of colored troops recruited largely in Kentucky. The first report covers the month of August, 1898.

CONDENSED SICK REPORT FOR AUGUST.

Mean strength	1,024
Admissions:	
From command	92
By transfer.....	1
Total to be accounted for.....	93
Disposition:	
Returned to duty.....	93
Remaining in regimental hospital.....	6
Remaining in quarters	19
Total	118

It would seem from these figures that there was a total sickness during the first month of the existence of this regiment of 118, and that 25 of these cases were incomplete at the end of the month. At least, this is the interpretation we place upon the somewhat confusing mixture of figures found on the face of the sick report. This report is signed by James Hepburn, surgeon, who makes the following statement:

The case of Private William McClendon, Company F, is probably of tubercular origin, as is also the case of Private Henry

Anderson, Company F. Private John Morgan, Company M, was bitten by a man, causing a lacerated wound of the first and second fingers of the right hand.

In the August report we find one case of recognized typhoid fever. This man is reported as being convalescent from typhoid fever. The case is registered as follows:

Conner, George P. H. August 1, convalescent from typhoid; returned to company August 19.

In the August report there are 13 cases diagnosed as malaria. Two of these, whose cases are designated as "intermittent quotidian," were off duty for twenty-four days.

In the August report there are 10 cases of diarrhea, but none of these were of sufficient duration to lead us to suspect that they were cases of typhoid fever. It will thus be seen that the number of probable cases of typhoid fever in this regiment during August was 3 and the number of recognized cases 1.

On September 1, 1898, this regiment was increased by two companies of the Indiana Volunteer Colored Infantry. These companies consisted of 208 enlisted men and 6 commissioned officers, all colored. These two organizations continued as one regiment until they were mustered out of service.

CONDENSED SICK REPORT FOR SEPTEMBER.

Mean strength	1,217
Admissions:	
Remaining from last month	20
From command	47
Otherwise	9
Total to be accounted for	76
Disposition:	
Returned to duty	73
Discharged for disability	5
Transferred to other hospitals	1
Remaining in regimental hospital	3
Remaining in quarters	8
Total	90

It will be seen that the figures for "admission" and "disposition" do not balance. This report is signed by Major Hepburn without comment. There was no case of recognized typhoid fever in this regiment during September. There were 5 cases of malaria, only 1 of which was of more than ten days' duration. This man was admitted to sick report September 9 and was returned to duty September 21. Under the head of intestinal disorders one man is recorded in this month's report as having been admitted to sick report August 15 with dysentery, and remained off duty until September 18. These are, so far as we can ascertain, the only possible cases of typhoid fever in the September report.

During the months of August and September and up to October 8 this command was stationed at Fort Thomas, Ky. On October 8 it left this place and arrived at Camp George H. Thomas, Chickamauga Park, Ga., October 10. It will thus be seen that the Eighth United States Volunteer Infantry arrived at Chickamauga Park four days after the Sixth United States Volunteer Infantry left this place. It will be of interest to ascertain whether this new command, coming upon the ground with but little typhoid fever, acquired the disease; and if so, to what extent.

CONDENSED SICK REPORT FOR OCTOBER.

Mean strength	1,174
Admissions:	
Remaining from last month	8
From command	58
Civilian	1
Total	(?) 66
Disposition:	
Returned to duty	44
Died (civilian)	1
Discharged for disability	12
Transferred to other hospitals	2
Remaining in hospital	11
Remaining in quarters	9
Total	79

The fault in mathematics of this surgeon is again indicated. This report is signed by Major Hepburn with the following remark:

Until October 8 this command was located at Fort Thomas, Ky. It arrived at Camp George H. Thomas, Chickamauga, Ga., October 10.

In the October report there are two cases of recognized typhoid fever. The initial date of one of these is October 1, before the regiment left Fort Thomas; the initial date of the other case is October 25, while the regiment was in Chickamauga Park. It will be seen from this that the statement that this regiment did not develop a case of typhoid fever while at Chickamauga Park is erroneous. The disposition of this case is not given in the report. Of the three cases of malaria reported in October, one had its initial date before the regiment reached Chickamauga, the other two afterwards. The disposition of the two that developed after reaching Chickamauga is not given, but there is no record of these men returning to their regiment at any time. Four cases diagnosed as dysentery and one as gastritis in the October report remained off duty for more than two weeks, and two of them (both diagnosed as dysentery) never returned to their regiment, or at least there is no record of their having done so. Another case was reported without diagnosis, and there is no record of this man returning to the regiment.

CONDENSED SICK REPORT FOR NOVEMBER.

Mean strength, 1,219.

Under the head of "admissions" there are no figures. It must not be inferred from this that there was no sickness in this command during November, for we find the following, under the head of "disposition:"

Returned to duty	84
Discharged for disability	5
Deserted	4
Transferred to other hospitals	1
Remaining in regimental hospital	18
Remaining in quarters	23
Total	135

There is no case of recognized typhoid fever in the November report. Under the diagnosis of malaria there are two cases of more than three weeks' duration. Six cases of undiagnosed fever are reported, and none of these had returned to duty up to December 31, 1898.

CONDENSED SICK REPORT FOR DECEMBER.

Mean strength	1,227
Admissions:	
Remaining from last month	27
From command	157
Total to be accounted for	184
Disposition:	
Returned to duty	155
Remaining in regimental hospital	13
Remaining sick in quarters	23
Total	191

In this report Major Hepburn states:

The prevailing diseases during this month have been measles and la grippe, with their usual sequelae. All cases of measles have been isolated in a separate ward provided for that disease, and all clothing and bedding disinfected before the patients were returned to quarters.

In the December report the return of three men convalescent from typhoid fever is recorded. Two of these men were taken sick before the regiment left Fort Thomas, and therefore are not of special interest to us in our study of typhoid fever at Chickamauga. The third case reported as being convalescent from typhoid fever belonged to the Indiana companies, and there is no information concerning the initial date of his illness. We can therefore say that no recognized typhoid fever developed in December. Three cases of malaria were suspiciously prolonged, and the same is true of one case of gastritis and one of undetermined fever.

We conclude from the study of this regiment that, while it was not altogether free from typhoid fever, its condition, so far as this disease is concerned, was not rendered worse by its going to Chickamauga Park. The conclusion reached after the above study of typhoid fever in the Eighth United States Volunteer Infantry is strengthened by the following letter from Gen. H. V. Boynton, chief of the Park Commission:

CAMP THOMAS, GA., November 2, 1898.

Maj. WALTER REED,

Chairman of Typhoid Board, Washington, D. C.

DEAR MAJOR: You asked me to keep you informed in regard to the health of our working force in the park. The situation is this: We have had employed 150 men for two months. They have filled up 3,175 sinks. About two-thirds of these sinks were left uncovered by departing troops. They have also restored all the field hospital sites. They have used water from the wells and springs of the park during the whole time that they have been engaged in this work. There has not been a case of typhoid fever or malarial fever among them, nor in our regular park force from April until the present time.

Truly, yours,

(Signed) H. V. BOYNTON.

Of course it must be borne in mind that the cool weather that prevailed after October 10 destroyed the fly as a carrier of the infection. We think that this is the probable reason why typhoid did not prevail in the Eighth United States Volunteer Infantry, and we do not believe that the comparative freedom of this regiment from typhoid fever was due to extraordinary sanitary precautions. It will be remembered that the regiments that went to Knoxville, Tenn., and Lexington, Ky., and those that came to these places from elsewhere than Chickamauga late in the season ceased to have typhoid fever in October. We believe that this is strong proof that the fly was one of the most important factors in the distribution of typhoid fever at Chickamauga.

TYPHOID FEVER AMONG HOSPITAL CORPS MEN IN THE FIRST AND THIRD ARMY CORPS.

We have been unable to obtain a statement of the strength of the Hospital Corps connected with the First and Third Army Corps. We find in the records of the various hospitals connected with the First and Third Army Corps 209 cases of recognized typhoid fever among the hospital corps men. At the time that we inspected the troops at Chickamauga Capt. H. B. Stotter was in command of the Hospital Corps. He stated that he had under his charge 110 men all told. The duties of these men consisted in acting as orderlies at Sternberg Hospital and in policing the grounds. Captain Stotter had at that time been at Chickamauga for five weeks, but had had charge of the Hospital Corps for only three weeks. In fact, he was placed in charge a short time after the opening of Sternberg Hospital. At the time of his taking charge of this corps all the men in it were on duty. At the time when he gave his testimony to us 36 were on the sick report; 16 of these were in the hospital. The prevailing diseases among the 20 in quarters were diarrhea and gastritis. Captain Stotter attributed the gastritis to the fact that these men drank too freely of infected milk. When we visited Sternberg Hospital we found the hospital corps men drinking Chickamauga Creek water from the hydrants, although this water had been

condemned. Captain Stotter attributed the diarrhea among his men to the use of this water. He reported that his men were fairly intelligent, amenable to discipline, and but little given to intoxication.

The following is an alphabetical list of total deaths among the hospital corps men connected with the First and Third Army Corps so far as we have been able to ascertain:

Name.	Rank.	Date.	Place of death.	Cause of death.
Beatty, Robert.....	Private.	1899, Feb. 26	Camp Shipp, Ala.....	Croupous pneumonia.
Bennett, Herbert H..	Private.	1898, Sept. 30	Chickamauga, Ga.....	Typhoid.
Bohn, Wm. J. (Ambulance Corps, First Division, Third Army Corps).	Private.	July 7do.....	Do.
Boynton, Elihu (Ambulance Corps, Second Division, First Army Corps).	Private.	Nov. 2	Knoxville, Tenn.....	Hemorrhage of the brain.
Brock, Aaron.....	Private.	1899, Jan. 2	Anniston, Ala.....	Typhoid.
Caldwell, Robt. H....	Private.	1898, July 4	Leiter General Hospital.	Appendicitis.
Campbell, Bernard J..	Private.	Nov. 4	Sternberg United States General Hospital.	Typhoid.
Cramer, Floyd B. (Third Division, First Army Corps).	Private.	Sept. 8	Hospital Hoff, Camp Thomas, Ga.	Do.
Cummings, Guy.....	Private.	Aug. 31	Belgrade, Me.....	Do.
Dalrymple, E. W. (Ambulance Corps).	Private.	Sept. 6	General Hospital, Chickamauga, Ga.	(Typhoid); malarial fever.
Fryer, Albert F. (Third Division, First Army Corps).	Private.	Sept. 17	United States General Hospital, Camp Thomas, Ga.	Typhoid.
Grimmett, Homer....	Private.	Aug. 17	Sternberg Field Hospital, Chickamauga, Ga.	Do.
Hatcher, James C.....	Private.	Aug. 22	Sternberg Hospital, Chickamauga, Ga.	Do.
Jones, Samuel M.....	Private.	Oct. 11	Camp Shipp, Ala.....	Meningitis, cerebro-spinal.
Kenefick, Stephen A..	Private.	Nov. 3	Sternberg General Hospital.	Typhoid.
Kiger, George (Ambulance Corps).	Private.	Oct. 25	Hospital Second Division, First Army Corps, Camp Poland, Tenn.	Do.
Leib, Joseph.....	Private.	Aug. 22	Sternberg United States Field Hospital, Chickamauga, Ga.	Do.
McAllister, James T. (Second Division, First Army Corps).	Private.	Sept. 18	Hospital Second Division, First Army Corps, Camp Poland, Knoxville, Tenn.	Poison; effects of opium.
McCann, Frederick...	Private.	1899, Jan. 9	Fort McPherson, Ga..	Typhoid.
Meredith, Brenton (Ambulance Corps, First Division, Third Army Corps).	Private.	1898, Aug. 1	Leiter General Hospital.	Do.
Messer, John P.....	Private.	Aug. 27	Fort Columbus, N. Y..	Do.
Nunns, Clarence C. (Ambulance Corps, Second Division, Third Army Corps).	Private.do....	Chickamauga, Ga.....	Do.
Perkins, George M. (Ambulance Corps, First Division, Third Army Corps).	Private.	Sept. 2	Camp Thomas, Ga.....	Do.
Peters, Fred W.....	(?)	Aug. 26	Sternberg General Hospital, Chickamauga, Ga.	Do.
Smith, William.....	Private.	Aug. 31	Leiter General Hospital, Chickamauga, Ga.	Do.
Wheelock, Charles F..	Private.	Dec. 3	General Hospital, Fort Thomas, Ky.	Typhoid, with hemorrhage.
Williams, E. A.....	Private.	Sept. 17	Sternberg Hospital...	Typhoid.

Deaths 27
Deaths due to typhoid fever 22

It would be interesting if we could ascertain the total number of cases of typhoid fever among the Hospital Corps men, on account of the close contact these men had with typhoid patients. It was customary during a part of the time at Chickamauga, as it was at other national encampments, to detail men from the line to serve as orderlies in the hospitals. In some places these details were made daily; in others, a detail was made for a week. At the expiration of the time for which the detail was made the men were returned to their respective regiments and other men for like purposes detailed at the hospital. This method of securing orderlies to care for patients with typhoid fever or other infectious disease is to be condemned most emphatically. Undoubtedly this was one of the means by which typhoid fever was spread through the different organizations. Men wholly ignorant of methods of disinfection were assigned to the task of caring for patients and disinfecting stools. Many of these men undoubtedly infected themselves and went back to their regiments without even disinfecting their hands. At one hospital we found that the orderlies went to their respective messes in the different regiments without washing their hands.

The following table showing the date of arrival and the initial date of illness of some of the Hospital Corps men probably has sufficient importance to justify us in giving it:

Number.	From—	Date of arrival.	Date when taken sick.	Diagnosed.
1	Columbus, Ohio.....	July 30	Sept. 8	Typhoid.
2	St. Paul, Minn.....	Aug. 1	Sept. 11	Do.
3	Fort Sheridan, Ill.....	July 31	Sept. 4	Do.
4	Fort Snelling, Minn.....do....	Sept. 10	Do.
5	Columbus, Ohio.....	June 20do....	Do.
6	St. Paul, Minn.....	July 30	Sept. 7	Do.
7	Columbus, Ohio.....	July 31	Aug. 29	Do.
8do.....do....	Sept. 6	Do.
9	Fort Sheridan, Ill.....do....	Sept. 10	Do.
10do.....	Aug. 19	Aug. 28	Do.
11	Columbus, Ohio.....do....	Sept. 6	Do.
12	St. Paul, Minn.....	July 18	Sept. 3	Do.
13	Washington, D. C.....	June 1	Aug. 25	Do.
14	Winchester, Ky.....	Aug. 12	Sept. 8	Do.
15	Fort Sheridan, Ill.....	June 1	Sept. 10	Do.
16	Wabash, Ind.....	June 18	Aug. 31	Do.

If we could know that none of these men received the typhoid infection before reaching Chickamauga the above data might be of some value in giving information concerning the period of incubation. The shortest period intervening between the date of arrival and the initial date of sickness in the above table occurs in No. 10, where the period is only nine days. Of course it is possible that this man might have been infected before reaching Chickamauga. On arriving at this place he immediately began his duties as orderly in Sternberg Hospital, and nine days later, as seen by the figures above, came down with typhoid fever.

TYPHOID FEVER AMONG FEMALE NURSES AT
CHICKAMAUGA.

We have not been able to ascertain the number of probable cases of typhoid fever developed among the nurses caring for the sick in Sternberg and Leiter hospitals, at Chickamauga. H. C. Lounsbery, chief nurse at Sternberg Hospital, furnished us with a report of the nurses who had left that hospital up to September 13, and the reason for leaving in each case. This information might be tabulated as follows:

Num- ber.	From—	Date of arrival.	Date of depart- ure.	Reason for departure.
1	Boston, Mass	Aug. 7	Sept. 10	Sick from overwork.
2	New York City	do	Sept. 8	Diarrhea.
3	do	do	do	Do.
4	Newark, N. J.	do	Aug. 19	Hysteria.
5	Boston, Mass	Aug. 17	Sept. 13	Typhoid fever.
6	Rochester, N. Y.	do	Sept. 7	Exhaustion from diarrhea.
7	Brooklyn, N. Y.	do	do	Do.
8	do	do	Aug. 30	Do.
9	Boston, Mass	do	Sept. 7	Do.
10	Brooklyn, N. Y.	do	Sept. 13	Do.

Num- ber.	From—	Date of arrival.	Date of depart- ure.	Reason for departure.
11	Pittsburg, Pa.	Aug. 17	Sept. 7	High fever.
12	Boston, Mass	do	Aug. 26	Broken down by night work.
13	New York City	do	Aug. 23	Diarrhea.
14	do	do	Aug. 30	Dismissed, not sick.
15	do	do	Sept. 6	Diarrhea.
16	Rochester, N. Y.	do	Sept. 11	Diarrhea and suspected typhoid.
17	Cincinnati, Ohio	Aug. 25	Sept. 2	Typhoid fever.
18	Wilkesbarre, Pa.	do	Sept. 13	Do.
19	Boston, Mass	Aug. 26	do	Do.
20	St. Louis, Mo.	Aug. 27	Sept. 6	High fever.
21	Wilkesbarre, Pa.	Aug. 29	Sept. 13	Rheumatism.
22	Chicago, Ill.	Aug. 23	do	Diarrhea and high fever.
23	do	Aug. 25	do	Do.

It will be seen that No. 17 developed typhoid fever eight days after her arrival at Chickamauga, while it is not certain that this nurse was not infected on reaching Sternberg Hospital, it is highly probable that she received the infection at that place. The next shortest period before typhoid fever developed is case No. 20. This nurse developed typhoid fever ten days after her arrival.

CHAPTER VII.

GENERAL REMARKS CONCERNING TYPHOID FEVER IN THE FIRST AND THIRD ARMY CORPS.

SITE.

The surface of Chickamauga Park is gently rolling, with sufficient grade to carry away the heaviest rain-falls. There are no morasses or swamps within the park. The surface is partly cleared and partly wooded, but everywhere the undergrowth has been cut out and there is nowhere dense forest. In some places local areas are somewhat flat, and may be damp during a rainy season; especially is this true when the flat surface is covered with woods. With the exception of such localities as these, there is no part of the park where an excellent site for a regimental camp might not be secured. Most of the little streams that drain the park are dry except after rains. However, some of them are fed by springs and flow continuously. Most of the drainage from the park passes ultimately into Chickamauga Creek, which flows along the southeastern border. A large part of the park is covered with magnesian limestone, upon which there has been deposited gravel which varies in depth from a few inches to many feet. The strata of this limestone have been broken and thrown into ridges, which dip at various angles. The outcropping rock is in many places broken and fissured in every direction, so that water easily percolates through the crevices and between the layers, frequently appearing on the surface and forming wet-weather springs. When the water penetrates greater masses of rock and passes for greater distances under the surface and accumulates in larger volume, permanent springs are formed. So far as the surface and the soil are concerned, there is only one objection to Chickamauga Park as an encampment for a large body of troops. This objection lies in the difficulty universally experienced in the summer of 1898 in digging sinks of sufficient size and depth and in having proper material with which the contents of these sinks could be covered. In many places the magnesian limestone lies directly on the surface. Pits could be made only by blasting, and when thus made were of insufficient size and could not be properly eared for.

It is a matter of some surprise that so many of the regiments located at Chickamauga should have en-

camped in the wooded portions. However, as has been stated, the woods were not dense anywhere, the undergrowth having been cut out so that it was easy to drive a team through any of the wooded portions of the park. There were some reasons for the regiments locating in the wooded rather than in the open spaces. In the first place, many of the regular regiments were temporarily encamped in the park during April, 1898, before the arrival of the volunteer regiments. The regular troops left the park late in April or early in May, and most of these regiments went to Cuba. The volunteer regiments on arriving found that the most desirable sites in the open portions of the park had already been occupied by the regular commands. Recognizing the fact that it was not safe to occupy sites so recently vacated by other regiments, the volunteers felt compelled in many instances to locate in the woods. In the second place, the open spaces were reserved in part for drill grounds. There were daily regimental and brigade drills and less frequent division and corps exercises. Thirdly, some of the open fields had been leased from the Government by individuals who refused to allow the troops to occupy these lands. This necessitated negotiations, which took time, and in the meanwhile the regiments encamped in the woods. However, we do not think that a great deal of stress should be laid upon the fact that the regiments were encamped in the woods. As has been already stated, these woods were well lighted and penetrated by the rays of the sun in every part. It is possible that the site of the First Mississippi Volunteer Infantry was in a space too densely wooded.

So far as the locations of the camps are concerned, there is one criticism that must be made by anyone who knows anything of the sanitation of camps. There is no adequate reason why the regimental camp sites in Chickamauga Park should not have been changed every three weeks, and yet it is a fact that many a tent pitched there in May was not moved until the regiments dispersed late in August. The records show that regimental medical officers petitioned time and time again for a change in camp sites, and that such petitions were in many instances wholly ignored.

Everyone versed in camp sanitation knows that under the very best conditions any given site will become more or less contaminated when occupied for a few weeks, and it is strange that the desirability of frequent changes in camp sites in Chickamauga Park during the summer of 1898 was not recognized and acted upon by superior line officers.

On account of the rolling character of the surface and the geological formation already described, it sometimes happened that one regiment had its health endangered by drainage from other regiments. This was so plainly the case in the Second Division of the Third Army Corps that it is strange that it was not early recognized and that the camps of some of the regiments were not changed.

DRAINAGE.

As has already been stated, nearly every acre in the park is provided with such excellent natural drainage that the excess of water falling upon it in the heaviest rain is soon removed. Numerous small streams wind among the slightly elevated knolls and act as natural sewers. One of the larger of these streams, known as Cave Spring Branch, through its tributaries receives the drainage of a large portion of the area covered by the encampments. This stream flows into Chickamauga Creek, and the relation of the junction of these two streams to the intake of the general water supply will be discussed later. On account of the variations in dip of the layers of limestone and also on account of the crevices in the layers of this stone, the drainage is not always on the surface. Water falling on an elevated area in the park in part passes down between the tilted and broken layers of limestone and reaches the surface at the foot of the hill. If the distance underground traversed by the percolating water is short and the depth of penetration is not great, a wet-weather spring results; on the other hand, if a larger volume of water accumulates under the ground and percolates to a greater distance, a permanent spring will result. The layers of limestone rock vary much in thickness. In many places they are superimposed one directly upon the other; in other localities the layers are separated by deposits of clay almost as hard as the rock itself, so that in drilling there is no noticeable difference between the rock and clay. For the reasons already given, the waters of many of the smaller springs, of some of the larger ones, and of some of the wells, became more or less turbid after heavy rains. This can be accounted for only by contamination with surface drainage. It will be readily seen that with the conditions as here described a polluted surface necessarily led to polluted springs and wells.

WATER SUPPLY.

Through and about the park are numerous large springs, supplying an almost unlimited quantity of water

which is apparently of the very best quality. Undoubtedly, when there is no unusual surface pollution about them, the water from any and all of these springs is quite safe. However, the largest of them may be contaminated to a greater or less extent by surface drainage. Crawfish Spring, the flow of which is estimated at 60,000,000 gallons per day, sometimes becomes muddy after heavy rains. In its normal state this is one of the most beautiful springs in the world. Numerous large springs, such as Sweet Spring, Blue Spring, Georgia Mineral Spring, Rossville Spring, etc., located outside of the park, furnished drinking water for the troops. From most of these springs water was dipped in pails, the man dipping the water standing upon the edge of the spring and with the water often undoubtedly falling over his boots and possibly contaminating the source of supply. The water was hauled to the camps from these springs in headless barrels. The barrels were deposited in the camp and men dipped with clean and unclean cups, possibly with clean and unclean hands, water from these barrels, and drank it. It must be admitted that the possibilities of occasional contamination of portions of the water obtained in this way were not insignificant.

We have already referred to the wet-weather springs. We are quite confident that these were a means of infection. Especially do we believe that this was true in the Second Division of the Third Army Corps. The location of some of the regiments of this corps was such that the contamination of wet-weather springs breaking out from the base of hills occupied by them was almost absolutely certain.

There are numerous wells throughout the park. These differ considerably in construction. It is generally believed that all of the wells in the park are driven ones. However, we have already seen from the testimony of Major Hysel that this is not true of Jay's mill well. In regard to the wells General Boynton, chief commissioner of the park, made this statement to us:

We had nine driven wells here when the troops began to arrive. These had been in use two or three years. Soon we saw that the supply from these would be insufficient. We obtained five drilling machines and began to put down wells as fast as we could wherever they were wanted. Most of this drilling was done before the rainy season set in. In boring for these wells we passed through gravel and loose rock near the surface, then we struck very solid rock, which ranged in thickness from 80 to 164 feet. A few of the wells are bored through less than 80 feet, while others are carried through 164 feet of rock. In drilling there is no evidence of cavities. The water flows in when we get down to what we call the water-bearing stratum. Usually, while boring, it is found necessary to pour water into the hole to facilitate the action of the drill. After the water-bearing stratum has been reached the water rises to within 10 feet of the surface, sometimes nearer. For instance, the well at the McDuffield place, which is 168 feet deep, was perfectly dry through 164 feet of rock, and immediately as soon as we got to the water-bearing stratum it came up to within 4 feet of the surface. At the Brotherton place the well is 125 feet deep and most of it through solid rock, and the water rises to within 4 feet of the surface.

We found considerable diversity of statement concerning the inquiry as to whether or not the water from these driven wells became cloudy after heavy rains. General Boynton stated that this occurred in only three wells within the park. He thought that in the case of these it could be explained only by contamination with surface drainage. Others stated that many of the wells in the park furnished turbid water after heavy rains. We think that there can be no doubt that there must have been surface contamination of at least some of these wells, and possibly the water from these may have served as a factor in the distribution of typhoid fever. The construction of these driven wells was apparently very good. The drill made an opening of a little more than 6 inches in diameter through the solid rock. Into this hole a wrought-iron casing was driven to a sufficient depth to make it water-tight. The casing above the rock was then set in hydraulic cement. Notwithstanding this care, there can be no doubt, as stated above, that the water did occasionally become turbid, and when this happened the only explanation possible is that the turbidity was due to surface drainage.

In addition to the above-mentioned sources, water was pumped from Chickamauga Creek and distributed by means of pipes through the various organizations encamped in Chickamauga Park. The only troops that did not receive piped water from Chickamauga Creek was the Second Division of the First Army Corps. The regiments of this division were located quite distant from any of the pipes, and this water could have been used by men belonging to this division only occasionally. The intake of the water supply from Chickamauga Creek was most unfortunate, as shown by the following illustration:

We have already mentioned the fact that a small stream known as Cave Spring Branch drained a large part of the territory covered by the encampments. This stream empties into Chickamauga Creek, and the intake of the general water supply was located dangerously near the junction of these streams. In fact, the intake of the water supply was immediately at the

junction of the two streams. However, Cave Spring Branch was deflected from its course by a canal and dam, so that it emptied into Chickamauga Creek about 45 feet below the mouth of the intake pipes. The first attempt to deflect Cave Spring Branch consisted of a flimsy riprap wall consisting of brush and broken stones. This poorly constructed dike was washed away by the first heavy rain, and Cave Spring Branch resumed its original course and flowed into Chickamauga Creek directly around the mouth of the three intake pipes. There certainly was no adequate excuse for taking the water from this point, and there can be but little doubt that the water supplied through the pipes did on more than one occasion become contaminated with the drainage from the camps flowing into Chickamauga Creek through Cave Spring Branch. With typhoid fever generally distributed through the regiments, the infection, as we have already seen, being brought to the park by most of the regiments, and with the drainage from all of these camps swept into this stream, it is impossible that the water of Cave Spring Branch should have escaped specific contamination with the typhoid bacillus, and it is well-nigh impossible that the water of Chickamauga Creek pumped through the pipes and distributed through the camps altogether escaped this contamination. In our opinion, there is but little doubt that the general water supply at Chickamauga became slightly contaminated. However, we are convinced from the distribution of the disease through the different organizations that contamination of the water supply was only one of the means through which the disease was spread. Moreover, as we have already seen, the Second Division of the First Army Corps was quite removed in its location from the water mains and pipes, and the men of this division could only occasionally reach this water, and yet this division suffered like the others from typhoid fever. For these and other reasons that have already been given, we are inclined to think that infected water was not the chief source of the spread of typhoid fever among the troops encamped at Chickamauga.

Unfortunately no satisfactory bacteriological examination of any of the waters used by the troops at Chickamauga was made at the proper time. On August 5, 1898, Professor Slocum, of Knoxville, Tenn., made a chemical analysis of 43 samples of water taken from various sources in the park. This analysis consisted of a determination of the amount of oxygen consumed. While we do not place any stress upon the value of these analyses, inasmuch as the evidence furnished is not convincing, we think ourselves justified in presenting in the following tabular form the results of Professor Slocum's work:

Results of analyses of water from various sources used by the troops in Camp George H. Thomas, Chickamauga Park, Ga.

No.	Source.	Location of same.	Oxygen consumed in 100,000 parts.	Quality of water.		No.	Source.	Location of same.	Oxygen consumed in 100,000 parts.	Quality of water.	
1	Well....	Brotherton road at Howell's Battery.	0.26	Impure...	Cased well; not used.	23	Well....	Bagwell's store	0.07	Pure.....	Open dug well.
2	Spring..	Jays Mill09	Pure.....		24	Spring..	White Smith's near Ravine.	.15	Doubtful purity.	Shallow dug well. Use stopped early.
3	Well....	Alexander road at "Tom Little's," Twelfth Minnesota.	.06do....	Cased well.	25	Well....	Brannan's house yard (old well).	.20do....	Shallow dug well. Used by troops.

22do....	Jays Mill road north of Alexander road....	.04do....	Do.						

Classification of Frankland and Tidy.

Oxygen consumed in 100,000 parts of water:

Section 1. Upland surface water:

Class 1. Water, great organic purity not more than	0.1
2. Water, medium purity not more than21
3. Water, doubtful purity not more than4
4. Water, impure more than4

Section 2. Deep wells and springs:

Class 1. Water, great organic purity not more than055
2. Water, medium purity not more than15
3. Water, doubtful purity not more than2
4. Water, impure more than2

In September, 1898, Acting Assistant Surgeon Carroll, under the direction of our board, collected samples of water from various sources in Chickamauga Park, and submitted the same to bacteriological examination.

Of course we understand that the bacterial flora of these waters in September does not represent the condition of the same waters in August. However, we had the waters examined as soon as we were able to do so. We publish in the attached tables the results of Doctor Carroll's work. It will be seen that he found the bacillus pyocyaneus in many of these waters. We do not know that any importance whatever is to be attached to the wide distribution of this bacillus in the waters of Chickamauga Park, nor shall we attempt to draw any conclusions therefrom. This organism has been found occasionally in the drinking water supplied to various cities. We give the results of Doctor Carroll's work without further comment:

Results obtained with water from Camp George H. Thomas,

No.	Location of well or spring.	4th-day culture at 39° to 41° C.	G. pig.	Died.
			<i>Grams.</i>

Acting Asst. Surg. Charles F. Craig, in his report from the bacteriological laboratory of Sternberg Hospital, to be appended later, gives some information concerning the bacteriology of some of the waters in the park. However, as his report refers chiefly to the existence of malaria, we will give the results of his work under that head.

In order to show that many of the medical officers at Chickamauga Park realized the gravity of the situation early in the season, we give from the large list of papers in our possession the following:

HEADQUARTERS FIRST BRIGADE, THIRD DIVISION,
FIRST ARMY CORPS, CAMP GEORGE H. THOMAS,
Chickamauga, Ga., June 27, 1898.

To the ASSISTANT ADJUTANT-GENERAL,

First Brigade, Third Division, First Army Corps.

SIR: Owing to the amount of diarrheal trouble and the increase of typhoid and other fevers in this brigade, I have the honor to recommend that the command be required to use only boiled water for drinking purposes. The present directions for boiling water are not carried out. This is partly due to the want of proper utensils and facilities for storing water. I would recommend that ordinary wash boilers be obtained for boiling the water, and the proper number of barrels for storing and cooling it be procured, but that the command be required to utilize such things as they may have until the desired equipment has been obtained.

As the rear sinks are infected by the excreta of patients with typhoid fever, I would recommend that chloride of lime be obtained in large quantities for their disinfection, and that every man using the sinks be required to use earth, or a mixture of earth and lime, at once, so that at no time will excreta be exposed to the air and flies.

As this is a very important matter, I would recommend that urgent measures be taken to procure the boilers, barrels, and lime at once, without regard to the ordinary methods of business.

I remain, very respectfully,

(Signed) J. D. GLENNAN,

Major and Surgeon, U. S. Volunteers, Brigade Surgeon.

SINKS.

The difficulty that was experienced in digging sinks of proper depth has already been frequently referred to. The rocky nature of the soil in many places made it well-nigh impossible to provide sinks of proper dimensions. When rock has to be blasted in order to prepare a sink the result must always be more or less unsatisfactory. However, the difficulty in providing and caring for the sinks was not confined to their construction. The amount of dirt thrown out in the digging of these sinks was inconsiderable, and after it had lain on the surface in the sun it became almost as hard and non-porous as rock. When this dirt was thrown back into the sink it did not absorb the liquid contents, but simply displaced the watery material, and when thrown in in considerable quantities caused the sinks to overflow. There was an almost universal complaint from regimental medical officers that lime could not be obtained early in the season for the disinfection of sinks. It seems strange that no one apparently ever thought of the possibility of manufacturing enough lime to supply

the entire encampment. There is in the park practically an unlimited supply of wood, and certainly an unlimited supply of limestone rock. The construction of a few limekilns would not have been a herculean task with the large number of men on hand, and this might have supplied an abundance of lime. However, we are satisfied that if there had been no shortage in lime the condition of affairs would not have been greatly improved. The thorough disinfection of the excretions of 60,000 men when deposited in pits in the earth, and especially when scattered on the surface of the earth, is not an easy task. We may regard it as an axiom that wherever and whenever a large number of men assemble and allow their own excretions to accumulate about them there and then typhoid fever will appear and will spread. We do not mean to infer from this that typhoid fever ever originates *de novo*, nor do we mean to have anyone understand that we believe that the colon bacillus or any other germ present in the normal excretions of men can develop into the typhoid bacillus. We do mean that typhoid fever is so widely distributed that in any large assembly of men collected from different parts of the country there will be some already infected with typhoid fever. From the dejections of these the typhoid bacillus will grow and flourish in polluted places and the disease will develop and spread.

If the troops at Chickamauga had been provided with ample means for disinfecting all excretions, we do not suppose that even under these conditions typhoid fever would have been altogether unknown, but the disease might have been limited to the men who reached the camp infected, and there could have been no widespread epidemic. We are quite thoroughly convinced that some substitute must be provided for the pit system in permanent camps. While troops are on the march, stopping here and there for a day or two at most, pits for the disposition of fecal matter are sufficient, but in permanent camps they always have been, are, and probably always will be a menace to the health of any command. While it is true that it was well-nigh impossible to properly construct sinks at Chickamauga, it must not be forgotten that in other encampments where there was no difficulty in digging sinks and where there was no scarcity of earth suitable for covering their contents, typhoid fever prevailed extensively. It has been urged by some that the great prevalence of typhoid fever at Chickamauga was due to the fact that such a large number of troops were massed at one place. Relatively there is some truth in this, but at no time was the density of the soldier population of Chickamauga Park as great as that of many of our cities in which typhoid is a rare disease. It can not, therefore, be truly said that typhoid fever at Chickamauga was the result of the massing of a large number of men. At least the spread of the disease was only incidental to this. If the excretions of these men could have been

carried away by means of properly constructed sewers, or if they could have been disinfected, and if camp pollution had not been permitted and if a pure water supply had been obtained, there is no reason why typhoid fever should have been more prevalent among the troops at Chickamauga in the summer of 1898 than it was in New York City.

We repeat that, in our opinion, the sink must no longer be permitted in permanent encampments. When possible, water carriage for fecal matter may be adopted, and when this is impracticable the thorough disinfection of all fecal matter in tanks such as recommended by this board will, we believe, reduce typhoid fever in permanent encampments to a few sporadic cases.

CAMP POLLUTION.

The greatest sanitary sin committed among the troops at Chickamauga in 1898, as well as in most other national encampments, was that of camp pollution. Some of the regimental camp sites became most disgustingly filthy. It is unnecessary to repeat our evidence on this point. Reference to the regimental histories already recorded will give one some idea of the condition of some of these camps. A few extracts from our stenographic notes taken at the time of our inspection further illustrate this point: "In the camp of the Third United States Volunteer Cavalry we found the sinks full to the top with fecal matter; soiled paper was scattered about the sinks, and the woods behind the regimental camp was strewn with fecal matter. The Second Kentucky Volunteer Infantry was located in the woods; fecal matter was deposited around trees and flies swarmed over these deposits not more than 150 feet from the company mess tents; the odor in the woods just outside of the regimental lines was vile. In the Ninth New York we found three battalion sinks supposed to have been filled with straw and burned out that morning. Fecal matter was found deposited on the ground around trees and a vile odor permeated the air around the sinks."

We found in the hospital of the Third Division of the First Army Corps that the stools were not disinfected at all. The bed pans were washed in water and were not disinfected. The fecal matter of attendants was received in galvanized-iron boxes of very imperfect pattern. There was abundant opportunity for the outside of the boxes to become foul, and there was no means provided for properly handling these boxes.

These are illustrations of the condition that we found at Chickamauga. When our board visited Chickamauga, most of the regiments had already departed, and it was expected that only the Sixth United States Volunteer Infantry would remain. The following is a copy of our recommendations to General Boynton concerning the care that should be practiced by this regiment.

KNOXVILLE, TENN., *September 14, 1898.*

Brig. Gen. H. V. BOYNTON,

Camp George H. Thomas, Chickamauga Park, Ga.

GENERAL: The board of medical officers, convened by S. O. 194, par. 40, A. G. O., Washington, D. C., August 18, 1898, for the special investigation of the origin and spread of typhoid fever in the army camps, begs to submit the following recommendations concerning the Sixth United States Volunteer Infantry, the only regiment now encamped at Chickamauga Park:

1. *Water supply.*—The men of this regiment being supplied with a presumably pure water from Mullis Spring, should be compelled to use this water only and no other for any purpose whatever. Every precaution should be taken to see that patrol parties should be supplied with drinking water from this source whenever absent from camp on such duty. Suitable bath houses should be erected for the use of the men, and they should be compelled to use this water for bathing purposes. Under no circumstances should Chickamauga Creek water, or water from any other source than this spring be used. If the regiment should be ordered out for a march, water from Mullis Spring, in abundant quantity, should be carried along for drinking purposes. From an inspection of this spring and its immediate surroundings made by the board, we recommend that immediate measures be taken to protect the spring against surface drainage. The barrels used for the purpose of storing drinking water should be elevated on supports, furnished with stopcocks for withdrawing the water, supplied with tight covers and protected from the sun by a proper shelter; they should be frequently inspected and from time to time cleansed and their interiors exposed to the direct sunlight for some hours.

2. *Mess tents and kitchens.*—No measures should be omitted to prevent the access of flies to the food. The board therefore urgently recommends that both kitchens and mess tents should be promptly and thoroughly screened. All milk consumed should be boiled and thereafter protected from the flies by proper screens. As an additional precaution the cooks and attendants about the kitchens and mess tents should be compelled to thoroughly and frequently wash their hands with soap and water every time they go to the kitchen and mess tents for the performance of their duty. None but authorized persons should be permitted to handle the food supplies. Soldiers should be forbidden eating any fruit or drinking any liquid except that furnished by the regiment. Men should be compelled to thoroughly wash their hands before going to meals.

3. *Kitchen garbage.*—Suitable vessels should be provided for the reception of kitchen garbage. These should be daily removed and their contents buried or burned at some point distant from the camp. For the garbage, zinc barrels with proper covers are recommended.

4. *Company sinks.*—At the time of the inspection by the board the sinks were in foul condition; exposed fecal matter was found in every sink. The board can not too strongly emphasize the necessity of each individual being absolutely required to cover his own excrement with dry earth before leaving the sink, and this should not be left to men detailed for the purpose, as with details fecal matter is left exposed for hours to the access of flies. The sinks should be sheltered and ditched so as to prevent the access of surface water to them. If the dry-earth closets should be adopted, a box should be provided separately for each hole, and should be wide enough to receive the urine and fecal matter without danger of these being deposited outside of or on the exterior surfaces of boxes, as will happen with the boxes now in use at Sternberg Hospital, for instance. An abundance of well-dried and pulverized earth should be provided in storage, completely sheltered from the rain. This should be freely used in the boxes, each man being compelled to cover his excrement as in case of the sink. In addition to the dry earth, lime should be used at least once a day, besides always being freely placed in the boxes after emptying them. In order to insure the execution of this

measure, if necessary a sentinel should be placed at each sink, or closet, with positive instructions for their enforcement.

5. *Tents*.—All tents should have a flooring raised at least 6 inches above the ground, and if practicable the soldiers should be provided with cots. All bedding and blankets should be daily exposed to the direct sunlight. Men should be compelled to remove their outer clothing at night. The floors of all the tents should be kept clean.

6. *Regimental hospital*.—All men with fever should be immediately removed to the hospital. The most thorough disinfection of the stools and urine of all patients under treatment in the hospital and of all bedclothing and personal linen should be required as a matter of routine. This recommendation should apply not only to all fever patients but also to all others. For the purposes of disinfection a solution consisting of 1 part of carbolic acid to 30 parts of water should be prepared in large quantities and stored in barrels, readily accessible as the sole disinfectant. A pint of this should be placed in each bedpan before it receives the discharge from the patient. When the bedpan is removed an additional pint of the solution should be added, and the vessel carried to the sink, emptied, and afterwards thoroughly washed with the same disinfecting solution. After each stool the patient's buttocks should be carefully cleansed with this solution. Whenever any fecal matter is spilled upon the floors or grounds the spot should be immediately cleaned and disinfected with this solution. All soiled personal and bed linen should be immediately removed and at once immersed in the same carbolic solution for at least two hours. Mattresses, bed linen, and the blankets should be daily exposed to the direct sunlight when not in use. All hospital tent floors should be scrubbed daily with this solution. The greatest attention should be paid to the disinfection and condition of the hospital sink in addition to the thorough disinfection of all stools. Lime and dry earth should be thrown into the sinks. The possibilities of flies gaining access to any fecal matter in the sinks should be absolutely prevented by this means. Attendants should be required to disinfect their hands after attending each patient in each instance. The recommendations made with reference to the company mess tents and kitchens apply with special force to the hospital mess tents and kitchens.

The foregoing apparently minute details concerning water supply, mess tents and kitchens, garbage, company sinks, tentage, and hospital, must be carried out in every particular if typhoid fever, already present in this command, is to be stamped out. We therefore recommend that each one of these sanitary regulations be placed upon the status of military discipline, and that an infraction of any of them be as severely punished as any other breach of discipline. In no other way can immunity be secured to this regiment of "immunes."

Very respectfully,

(Signed) WALTER REED,
Major and Surgeon, U. S. Army.

VICTOR C. VAUGHAN,
Major and Division Surgeon, U. S. Volunteers.

E. O. SHAKESPEARE,
Major and Brigade Surgeon, U. S. Volunteers.

Subsequently we recommended that the galvanized-iron boxes prepared by our board and adopted by the Surgeon-General should be used in place of sinks.

After inspecting the Second Division of the First Army Corps at Knoxville, the board made the following report:

KNOXVILLE, TENN., September 16, 1898.

To the ADJUTANT-GENERAL,

SECOND DIVISION, FIRST ARMY CORPS,

Camp Poland, Knoxville, Tenn.

SIR: The board of medical officers convened per Special Orders, 194, paragraph 40, Adjutant-General's Office, Washington, D. C., August 18, 1898, respectfully submit the following recommendation in compliance with the provisions of said order:

1. *Water supply*.—As far as the board has been able to judge the water supply appears to be of good quality. The supply of the city of Knoxville proper has been used by the Fourth Tennessee Volunteer Infantry for more than two months, and although there are a few cases of typhoid fever in this regiment, these are plainly not due to water contamination. The supply of West Knoxville is presumably of good quality.

2. (a) *Kitchen sinks*.—All garbage should be received into water-tight barrels and carried away from the camps daily; wash water should be thrown into pits in which dry earth and ashes are daily used for covering. As a rule, kitchen sinks have been found in good sanitary condition. The best cared for kitchen sinks are those of the First West Virginia and Sixth Ohio; the worst those of the Thirty-first Michigan, Second Ohio, First Pennsylvania, and Fourteenth Minnesota. Earth should be placed in the sinks whenever fluid garbage is emptied into them. There is needed frequent inspection of these sinks by company and medical officers to insure a good sanitary condition.

(b) *Company sinks*.—With the presence of typhoid fever among the men of every regiment constituting this division, except the Sixth Virginia Infantry (a recently recruited regiment), the board must express considerable surprise that so little attention is given to the condition of these sinks; not one was found to be properly cared for; exposed fecal matter, with attendant flies, was found in every sink. The sinks of the Sixth Ohio were in the best condition, the remainder were all foul and offensive. This condition, a constant menace to health, should not be tolerated any longer. Every soldier in this command should be compelled to cover with dry earth his excrement as soon as deposited. In no other way can sinks be kept in a safe and sanitary condition. If necessary to enforce this order sentinels should be placed near each sink to see that men cover at once their excrement. The proposal to keep sinks dark is not considered advisable. Light should be admitted, so that the sink can be inspected at all times. Once each day lime should be freely used to cover the margins, sides, and bottoms of all sinks. In the opinion of the board no sanitary measure is so important for the health of this command as such care of sinks as has been recommended above. At the inspection made this day of the camp site of the Sixth Virginia and Third North Carolina Infantry it was found that the men of both of these regiments were using the abandoned sinks of the First Pennsylvania Regiment. These sinks were found to be in an indescribably filthy condition, disgraceful to any command; not even a shovelful of earth had been placed in any sink. If such condition of the sinks of this command is to be permitted, then all efforts to stamp out typhoid fever will be of no avail. Already typhoid fever has appeared among the men of one of these regiments (Third North Carolina).

We visited the camp of the Fourth Tennessee with considerable interest, as we had understood that this regiment had so far escaped typhoid fever. However, we found they had already had one death from this disease, and there are now two cases of typhoid fever in their regimental hospital. This command has a regimental sink to which no attention is given, and its condition is such as to practically guarantee the distribution of typhoid fever

throughout the regiment. We learn that this regiment intends to adopt the "tub" system of disposing of fecal matter. If there be any form of disposition of fecal matter more dangerous to the soldier than the unkept sink, it is the tub. We have seen abundant evidence of this in the Seventh Army Corps. The tub is a portable privy, often laden with typhoid infection, which is scattered from the privy to the place where the matter is deposited. We beg to protest most earnestly against the tub system. We suggest that battalion sinks be properly constructed and properly cared for in this regiment. If this be done, there is the possibility of stamping out the disease. We feel quite certain that the medical officer of this regiment will fail to recognize typhoid fever in its early stage; we therefore recommend that the sanitary inspector visit this regiment at least twice each week, and that he not only inspect the sinks, but also examine the patients in the regimental hospital and in quarters, and, should new cases appear, this regiment should be immediately moved to another site. This suggestion that the sanitary inspector look after regimental hospitals should apply to all regiments having such hospitals. He should see that the stools of all patients in these hospitals are properly disinfected. Unless constant attention be given to the care of sinks and the disinfection of stools the experience at Chickamauga will be repeated at Knoxville.

3. *The division hospital.*—The board made an inspection of this hospital on the 14th instant. The number of patients on this date was about 235. The wards were found to be overcrowded, as many as seven or eight patients being in each tent. The floors of the general pavilion, as well as of the tents, were in a filthy condition. As far as the board was able to judge by inspection and by questioning the nurses, no attention was paid to the disinfection of either stools or personal or bed linen. Patients with garments soiled with typhoid discharges were found in one of the wards. Bed pans used for the patients were soiled with discharges not disinfected. Open vessels containing the nondisinfected discharges of typhoid patients were being carried from the wards to the sink, there emptied without disinfection, and the contents allowed to drop upon the surrounding ground. The sink intended for the reception of typhoid discharges was very offensive. The margins and sides of the sink were in like condition. It was evident upon inspection that the surgeon in charge had no appreciation of the need of disinfection of stools or linen or of the need of cleanliness in the hospital. The board found the number of nurses to be insufficient. In the opinion of the board no time should be lost in securing the services of trained female nurses for this hospital, in order to enable proper care and attention to be given to the sick.

The most thorough disinfection of all stools and urine of all patients under treatment in the hospital and of all bed clothing and personal linen should be required as a matter of routine. This recommendation should apply not only to all fever patients, but also to all others. For the purposes of disinfection, a solution consisting of one part of carbolic acid to thirty parts of water should be prepared in large quantities and stored in barrels readily accessible as the sole disinfectant. A pint of this should be placed in each bed pan before it receives the discharge from the patient; when the bed pan is removed an additional pint of the solution should be added and the vessel carried to the sink, emptied, and afterwards thoroughly washed with the same disinfectant solution. After each stool the patient's buttocks should be carefully cleansed with the same disinfectant solution. Whenever any fecal matter is spilled upon the floors or ground the spot should be immediately cleaned and disinfected with this solution. All soiled personal and bed linen should be immediately removed and at once immersed in the same carbolic solution for at least two hours. Mattresses, bed linen, and the blankets should be daily exposed to the direct sunlight when not in use. All hospital tent floors should be scrubbed daily with this solution. The greatest attention should be paid to the disinfection and condition of the hospital sink; in addition to the thorough disinfection of all stools, lime and dry

earth should be thrown into the sinks. The possibility of flies gaining access to any fecal matter in the sinks should be absolutely prevented by this means. Attendants should be required to disinfect their hands after attending each patient in each instance.

The board especially recommends as an important sanitary measure that men with fever should be immediately removed from their regimental quarters or regimental hospital to the division hospital. Under no circumstances should the men with fever be permitted to occupy the tents with their comrades.

4. *Camp sites.*—Since it is true that every regiment in this division has been and is infected with typhoid fever, it follows that the ground upon which each and every regiment has been or is located is also infected. We therefore deem it very unwise to encamp a regiment upon sites vacated by those leaving. The tent floors left by the First Pennsylvania are now being used by the Sixth Virginia; this should not be done until these floors have been washed with a 5 per cent solution of carbolic acid and afterwards exposed to the direct rays of the sun for at least two days.

The foregoing recommendations are respectfully submitted.

(Signed)

WALTER REED,

Major and Surgeon, U. S. Army.

VICTOR C. VAUGHAN,

Major and Division Surgeon, U. S. Volunteers.

In extenuation of the condition of the camps at Chickamauga, it has been stated that all of the regiments there were on waiting orders and expected every day that they would start the next for Cuba or Porto Rico. This is true, but it should not be offered in extenuation of the condition of the camps. Every camp, even when it is to be occupied for only a day, should be policed as thoroughly as if the commanding officer knew that he was to remain there for weeks.

SHELTER, OCCUPANCY, AND ARRANGEMENT OF CAMPS.

On this point we will copy verbatim from the report of Major Woodhull, who inspected the troops at Chickamauga in August:

All the troops are under canvas and nearly all the canvas is overcrowded. The tents are of many patterns—a few shelter, more conical, and conical wall; some State tents of various sizes, the most of which are so-called "flood" tents of the Mississippi Valley, very old and nearly all leaky, and the greater part the improved common or A wall tent. The occupants vary from two in the shelter to four and five in the A, six or eight in the "flood," and fifteen or sixteen in the conical.

Many of the regimental sites are precisely the same as those occupied from the beginning. A few of the regiments have been moved, and it is probable that more are now being changed, but at the time of my observation many of the commands had been in absolutely the same position for two months or more. Not only were the camp sites the same, but in the most instances the tents themselves stood where they had first been placed. In scarcely any instance was fresh ground available, as it should be, upon which the tents might be moved laterally every week or ten days. Consequently the ground itself is being poisoned imperceptibly, but persistently, by the human body, without the disinfectant and redeeming action of direct sunlight upon it. The contents of the tents, such as blankets, straw, and the like, have been irregularly removed into the open air, but, as a rule, not often enough. Direct touch showed in many instances that these articles and the ground were damp. The camps, speaking generally, were crowded not merely as to inhabitants, but as to the neighborhood. There was abundant room between divisions and generally between brigades, but many of the brigade camps were too compressed, and with some of the regiments the compression was extreme and in

defiance of all sanitary laws; this in addition to the tents themselves having too many occupants. The difficulty probably arose originally from the expectation that many more troops would be sent into the park, for whom space must be reserved. In some cases higher authority arbitrarily established the regimental lines. Whatever the reason, the effect is clear—the tents are overcrowded and without sufficient adjoining space, the streets are narrow, and the soil is becoming more and more charged with filth. Owing to reasons previously explained, company sinks were made with difficulty and were multiplied on account of their shallowness and the rapidity with which they filled with water. They thus encroached more and more upon the open space and intruded toward the camps. For instance, in the Second Arkansas, Second Brigade, Second Division, Third Army Corps, the men's sinks were within 30 yards of the kitchens, and were very offensive. The kitchen sinks were intermediate and so full and so foul that maggots were abundant on the surface. In the Fifth Pennsylvania the camp site was lower than the sinks, and during recent rains they overflowed and flooded the camp. The sick report of the regiment was 11 per cent, including 25 cases recognized as typhoid and 15 supposed to be of that disease, with the sick rate increasing.

More than half of the men slept on the ground. In some regiments the tents were floored, in others cots and field bedsteads were arranged, but always at private or regimental expense. The motive in many instances doubtless was comfort, but in one regiment (Third Tennessee) the men bought the cots, because they had learned by experience in civil life that it was harmful to sleep on the ground in that climate. In a very sickly regiment (Ninth Pennsylvania) the medical officer pointed out a very high three-story bunk whose tenants he declared the healthiest in the command. A group of three is too small to reason from, but it is significant that among much sickness these men escaped. The sanitary advantage of being off the ground is freedom from dampness and especially escape from the immediate influence of the ground air which, under the conditions described, must be peculiarly deleterious. It is recommended that in all camps of position in southern climates the tents be floored, with a considerable space beneath, and that the floors be portable, so that they may be moved (within the camp) when necessary for change of site or for police. The expenditure for a few feet of lumber when the regiment departs is well balanced by the greater physical efficiency of the men.

Quite independently of any specific contamination of the water supply (and were the general water supply thus contaminated the typhoid fever would also be general, which it is not as yet) the pollution of the soil by fecal discharges, specifically diseased or healthful, leads to the occurrence of diarrhea, to general physical depression, moderate fever, and undermining the man's health; and whether an imported case or not is necessary to fire the train, it is the universal experience of armies that outbreaks of typhoid fever will occur under just such circumstances. This is perfectly understood and always anticipated by sanitarians where precautionary measures are not carried into effect. In this case, besides having a congenial soil fertilized day by day for such seed, the seed itself was introduced directly by various regiments, as the Thirty-first Michigan, First South Carolina (as reported, regiment has left the park), Fifty-second Iowa, which brought no acute case, but was infected before arrival, and Ninth Pennsylvania, which has had nearly one hundred cases in all. Besides which, certain regiments (Fourteenth Minnesota, Second Ohio, Third United States Volunteer Cavalry) have treated cases for considerable periods in the camps themselves. It can not be necessary to enlarge on the facilities for the spread of this disease that are afforded by fatigue, heat, moisture, overcrowding, dust, and flies; and all these are present.

The following figures give the most important facts concerning typhoid fever in the First and Third Army Corps:

FIRST ARMY CORPS.

FIRST DIVISION.

Brigade and regiment.	Strength.	Total number of probable cases.	Percentage of troops with typhoid fever.	Number of recognized cases.	Total deaths.	Deaths from typhoid.	Percentage of deaths among probable cases.	Percentage of deaths among recognized cases.
<i>First Brigade.</i>

SIXTH UNITED STATES VOLUNTEER INFANTRY.

Sixth United States Volunteer Infantry		133		121	6	5	3.75	4.13
--	--	-----	--	-----	---	---	------	------

In the above tables the figures showing the strength of each regiment are not absolutely correct. In most cases the figures are those that indicate the strength of the regiment when it left Chickamauga. For the purposes for which these tables are compiled, it would be better if we could give the total number of individuals connected with each regiment, but figures showing this fact are not at our command.

In coming to conclusions concerning typhoid fever among the troops of these corps, it will be necessary to leave out of consideration the seven regiments of the First Division of the First Army Corps that went to Porto Rico, because, as has already been stated, undoubtedly a considerable proportion of the cases of protracted fever in these regiments were malarial, and from the data at our command we have been unable with any certainty to distinguish the malarial from the typhoid fevers in the cases originating in Porto Rico.

There were only two regiments (Fifth Illinois and Third Kentucky) of the First Division of the First Army Corps that did not go to Porto Rico.

These two regiments had a combined strength of 2,589.

Total number of cases of probable typhoid fever in these two regiments.....	344
Percentage of probable typhoid fever among the troops of these two regiments.....	13.28

Total number of deaths from typhoid fever in these two regiments.....	19
Percentage of deaths among cases of probable typhoid fever in these two regiments.....	5.52

We can not give the total number of cases of recognized typhoid fever in these two regiments on account of having no data on this point for the Third Kentucky.

Aggregate strength of the Second Division of the First Army Corps.....	11,344
Total number of cases of probable typhoid fever in the Second Division of the First Army Corps.....	2,172
Percentage of probable typhoid fever among the troops of the Second Division of the First Army Corps.....	19.14
Total number of deaths from typhoid fever in the Second Division of the First Army Corps.....	111
Percentage of deaths among probable cases of typhoid fever in the Second Division of the First Army Corps.....	5.11
Total number of cases of recognized typhoid fever in the Second Division of the First Army Corps.....	979
Percentage of deaths among recognized cases of typhoid fever in the Second Division of the First Army Corps....	11.34

In studying the Third Division of the First Army Corps, it will be necessary to omit the First South Carolina, which remained at Chickamauga only a few days.

Aggregate strength of the eight regiments of the Third Division of the First Army Corps.....	10,329
Number of cases of probable typhoid fever in the eight regiments of the Third Division of the First Army Corps.....	2,726
Percentage of probable typhoid fever among the troops of the eight regiments of the Third Division of the First Army Corps	26.39
Total number of deaths from typhoid fever in the eight regiments of the Third Division of the First Army Corps ...	169
Percentage of deaths among probable cases of typhoid fever in the eight regiments of the Third Division of the First Army Corps.....	6.20
Total number of cases of recognized typhoid fever in the eight regiments of the Third Division of the First Army Corps.....	1,241
Percentage of deaths among recognized cases of typhoid fever in the eight regiments of the Third Division of the First Army Corps	13.62

In studying the First Division of the Third Army Corps, it will be necessary to omit the First District of Columbia Volunteers, because this command remained at Chickamauga only a few days.

Aggregate strength of the eight regiments of the First Division of the Third Army Corps.....	9,444
Total number of cases of probable typhoid fever in the eight regiments of the First Division of the Third Army Corps.....	1,853
Percentage of probable typhoid fever among the troops of the eight regiments of the First Division of the Third Army Corps	19.62
Total number of deaths from typhoid fever in the eight regiments of the First Division of the Third Army Corps.....	160
Percentage of deaths among probable cases of typhoid fever in the eight regiments of the First Division of the Third Army Corps	8.63
Total number of cases of recognized typhoid fever in the eight regiments of the First Division of the Third Army Corps.....	725
Percentage of deaths among recognized cases of typhoid fever in the eight regiments of the First Division of the Third Army Corps	22.06

Aggregate strength of the nine regiments of the Second Division of the Third Army Corps.....	11,124
Total number of cases of probable typhoid fever in the nine regiments of the Second Division of the Third Army Corps.....	2,565
Percentage of probable typhoid fever among the troops of the nine regiments of the Second Division of the Third Army Corps	23.05
Total number of deaths from typhoid fever in the nine regiments of the Second Division of the Third Army Corps.....	257
Percentage of deaths among probable cases of typhoid fever in the nine regiments of the Second Division of the Third Army Corps	10.01
Total number of cases of recognized typhoid fever in the nine regiments of the Second Division of the Third Army Corps	1,016
Percentage of deaths among recognized cases of typhoid fever in the nine regiments of the Second Division of the Third Army Corps	25.29

The aggregate strength of the First and Third Army Corps, excluding the regiments that went to Porto Rico from the First Division of the First Army Corps, the First South Carolina from the Third Division of the First Army Corps, and the First District of Columbia Volunteers from the First Division of the Third Army Corps, was 44,830.

Total number of cases of probable typhoid fever among these troops.....	9,660
Percentage of probable typhoid fever among these troops..	21.54
Total number of deaths from typhoid fever among these troops	716
Percentage of deaths among probable cases of typhoid fever among these troops.....	7.41
Total number of cases of recognized typhoid fever among these troops.....	4,125
Percentage of deaths among recognized cases of typhoid fever among these troops.....	17.35

If to the above figures we add those of the Cavalry Brigade, we have the following:

Total number of troops in the First and Third Army Corps for which statistics concerning typhoid fever have been collected.....	47,975
Total number of cases of probable typhoid fever among these troops.....	10,339
Percentage of probable typhoid fever among these troops..	21.55
Total number of deaths from typhoid fever among these troops	752
Percentage of deaths among probable cases of typhoid fever among these troops.....	7.27
Total number of cases of recognized typhoid fever among these troops.....	4,373
Percentage of deaths among recognized cases of typhoid fever among these troops.....	17.19

We are without sufficient data to enable us to add to these figures those from the Light Artillery Brigade and from the Sixth United States Volunteer Infantry.

We have used one statement in all of these compilations which, without proper explanation, may be misunderstood. We have given the percentage of deaths among recognized cases of typhoid fever. We have

already called attention to the fact that the statement of this percentage is not altogether correct, because all the deaths from typhoid fever did not occur among recognized cases of typhoid fever. It may be of interest to inquire how the regimental and hospital surgeons diagnosed the cases which terminated fatally from typhoid fever. The 716 deaths given in the above figures as total deaths from typhoid fever in the First and Third Army Corps, excluding the regiments that went to Porto Rico from the First Division of the First Army Corps, the First South Carolina from the Third Division of the First Army Corps, the First District of Columbia Volunteers from the First Division of the Third Army Corps, and the cavalry brigade of the First Army Corps, were not all diagnosed typhoid fever by army medical officers. By looking over the list of deaths given in each regiment one easily sees that a considerable number of these deaths occurred after the patients had reached their homes on furlough. Most of these men sent home on furlough are recorded in the regimental and hospital reports as having malaria, or they were sent home without any definite diagnosis. Taking the 716 cases referred to, the recorded diagnoses of these cases were as follows:

Typhoid fever.....	391
Malaria.....	146
Undiagnosed, or undetermined fever	141
Diarrhea.....	22
Dysentery	9
Indigestion	4
Gastritis.....	1
Enteritis.....	1
Pneumonia	1
Total	716

In other words, in 4,125 cases of recognized typhoid fever among these troops 391 died. After studying the records we have added 5,535 cases which we believe to have been typhoid fever. Among the 4,125 cases of recognized typhoid fever there were 391 deaths; among the 5,535 cases which we have added there occurred 325 deaths from typhoid fever.

Percentage of deaths among the 4,125 cases of recognized typhoid fever	9.47
Percentage of deaths from typhoid fever among the 5,535 cases of probable typhoid fever.....	5.87

This, we think, is the strongest proof that we can offer that the cases which we have classed as probable typhoid fever are properly classified. The death rate among these from typhoid fever is the death rate of typhoid fever. As has already been stated, most of these men were allowed to go home on furlough. They were granted furlough on the diagnosis of some other disease than typhoid fever. They went to their homes, and 323 out of the 5,367 cases died from a disease recognized by the physician who attended them in their last illness as typhoid fever. We think that these fig-

ures establish beyond any doubt our claim that the number of cases of typhoid fever among the troops in the First and Third Army Corps was more than twice the number recognized as having that disease.

Out of the 716 deaths from typhoid, 352 occurred in some army hospital, 317 occurred elsewhere, principally at the homes of the men, and in 47 cases we have not been able to ascertain the place of death. Parenthetically it might be remarked that these figures show that the general order permitting medical officers to send home sick men on furlough was not abused. The number of malingerers must have been very small. This was the opinion of the army medical officers at Chickamauga at the time. Frequently the statement was made that it was difficult to induce the men to accept furloughs until they became too sick to travel. All those who saw the sick returning from Chickamauga and other camps during the summer of 1898 must have been convinced by the appearance of these furloughed soldiers that they were in reality sick. The figures which we have just given confirm this impression with mathematical exactness.

We have several times spoken of the death rate of typhoid fever. It may be well to endeavor to ascertain what the death rate of this disease is. It is well known that ever since typhoid fever has been recognized as a distinct disease and has been distinguished from typhus fever the death rate from this disease has gradually decreased. This decrease in the death rate is undoubtedly due to two causes. In the first place, the diagnosis of the disease is much more easy than it was formerly when typhus fever was so prevalent; in the second place, the methods of treatment of typhoid fever have greatly improved. Murchison reported 2,505 cases that occurred in the London Fever Hospital from 1848 to 1862, with a death rate of 18.5 per cent; Griesinger collected 18,612 cases from the hospitals of London, Glasgow, Paris, and Strasburg from 1840 to 1865, and found a death rate of 18.52 per cent. In the Old Hospital in Vienna from 1846 to 1861 there were 21,189 cases of typhoid fever, with a death rate of 22.2 per cent; in the Jacobs Hospital, in Leipzig, from 1880 to 1893 there were 1,626 cases, with a death rate of 12.7 per cent; in the city of Hamburg during the years 1886 and 1887 there were 10,823 cases, with a death rate of 8.5 per cent. These cases were divided by years as follows: In 1886, 3,948 cases, with a death rate of 9.2 per cent; in the year 1887, 6,875 cases, with a death rate of 6.9 per cent. In 1897 there were 1,885 cases at Maidstone, England, with a death rate of 7.5 per cent. Brand has collected 19,017 cases treated by cold baths, with a mortality of 7.8 per cent.

All the above-given figures have been obtained from European sources and refer, many of them, to epidemics more or less remote in time. We have been anxious to ascertain the mortality from typhoid fever in this country and at this time. In order to get information on this subject we have addressed a request to the superintendents of several of the largest hospitals in the United States, asking for the number of cases of typhoid fever treated in the years 1896 and 1897, and the number of deaths in each of these years. We have not asked for cases in 1898, because we wished to avoid cases among soldiers. The following figures have been obtained in response to this request:

Death rate from typhoid fever in some of the larger hospitals in the United States.

Name of hospital.	Number of cases.		Deaths.		Total cases in 1896 and 1897.	Total deaths in 1896 and 1897.	Percentage of deaths.
	1896.	1897.	1896.	1897.			
City Hospital, Boston, Mass.....	437	399	44	46	836	90	10.76
Massachusetts General Hospital, Boston, Mass.....	151	100	16	8	251	24	9.56
Episcopal Hospital, Philadelphia, Pa.....	153	141	13	10	294	23	7.82
University Hospital, Philadelphia, Pa.....	20	36	1	3	56	4	7.14
German Hospital, Philadelphia, Pa.....	64	153	7	10	217	17	7.83
Johns Hopkins Hospital, Baltimore, Md.....	110	116	11	3	226	14	6.19
St. Luke's Hospital, New York, N. Y.....	32	34	1	0	66	1	1.51
Bellevue Hospital, New York, N. Y.....	72	76	11	11	148	22	14.86
Mount Sinai Hospital, New York, N. Y.....	105	94	8	9	199	17	8.54

Total number of cases of typhoid fever in these hospitals..... 2,293
 Total number of deaths among the cases treated in these hospitals..... 212
 Percentage of deaths among these cases..... 9.24

It will be seen from these figures that the average death rate from typhoid fever in the large hospitals is a little more than 9 per cent. Bearing in mind that only graver cases are carried to hospitals and that the cases treated in hospitals embrace all ages and conditions of life, while the soldiers were men selected on account of physical perfection, it must be admitted that a death rate of 7.27 per cent among the 10,339 probable cases of typhoid fever in the First and Third Army Corps was not an unusually low one.

We have endeavored to ascertain the death rate from typhoid fever in general practice in some of the largest cities in the Union. With this in view, we directed a letter to the health commissioner of each of these cities. Most of these officials reply that they are unable to give anything more than the number of deaths, inasmuch as cases of typhoid fever are not reported to the health authorities. From a few cities returns have been furnished us. In our opinion, these are wholly worthless so far as information concerning the death rate from typhoid fever is concerned. They are, however, of

interest for another reason, and we will give some of them:

Death rate from typhoid fever in certain cities in the United States.^a

City.	Year.	Number of cases.	Number of deaths.	Percentage of deaths.
Buffalo, N. Y.....	1894	1,088	185	17.00
	1895	397	98	24.68
	1896	274	68	24.81
	1897	201	63	31.34
	1898	280	98	35.00
Albany, N. Y.....	1896	438	97	22.14
	1897	440	84	19.09

	1897	433	124	28.63
St. Louis, Mo.....	1896	2,490	402	16.14
	1897	2,994	401	13.38

^aToo late for insertion in this table, we have received the following figures concerning typhoid fever in New York City:

Number of cases of typhoid fever treated in New York City during the year 1896.....	1,004
Number of cases treated during the year 1897.....	1,004
Number of deaths among those treated in 1896.....	297
Number of deaths among those treated in 1897.....	299
Percentage of deaths among those treated in 1896.....	29.64
Percentage of deaths among those treated in 1897.....	29.78
Total cases treated in New York City in 1896 and 1897.....	2,008
Total deaths among those treated in 1896 and 1897.....	596
Percentage of deaths among those treated in 1896 and 1897.....	29.71

Dr. Roger S. Tracy, register of records, sends the following statement with these figures:

"The 'cases treated,' as given above, are the cases reported to the department of health. It is not probable that all cases are reported, and there is no way of estimating the number that may go unreported. Of course all the deaths are included, excepting the possible few cases that may be unrecognized and go upon the record under other names."

It will be seen from these figures that the physicians of New York City fail to recognize typhoid fever to a greater extent than did the army surgeons at Chickamauga.

Total number of cases of typhoid fever reported in the above-mentioned cities in 1896 and 1897.....	15,675
Total number of deaths among the cases reported in the above-mentioned cities in 1896 and 1897.....	2,659
Percentage of deaths among reported cases in the above-mentioned cities.....	16.96

What information have we gained from these figures? Are we to infer from them that the death rate from typhoid fever in general practice in our large cities is 16.96 per cent, while in our hospitals, to which, as a rule, the graver cases are sent, it is only 9.24 per cent, and while in the city of Hamburg it is only 8.5 per cent? In our opinion, such inferences are not warranted. We are forced to conclude that in those cities in which the health regulations require physicians to report all cases of typhoid fever a large per cent of the cases of this disease are not recognized as typhoid fever. The army surgeon has been severely criticised for not recognizing typhoid fever. What can be said of the average physician in general practice in our country? We must call attention to the similarity in two sets of figures. Referring back to our percentage records concerning deaths from typhoid fever in the First and Third Army Corps, it will be seen that the percentage of deaths among recognized cases of typhoid fever was 17.35; now we have found that in the above-mentioned

cities the death rate among recognized cases of typhoid fever is 16.96 per cent. In other words, the army surgeon did in his military service just as he was in the habit of doing in his civil practice; that is, he failed to properly diagnose the milder cases of typhoid fever. His military record on this point is no worse and no better than was his own record in civil practice, or is the record of physicians in some of the largest cities in the United States.

MALARIAL DISEASES IN THE FIRST AND THIRD ARMY CORPS.

As has already been stated, all kinds of illnesses were diagnosed malaria at Chickamauga. We find the most trivial cases, as well as the most serious ones, recorded as malaria. The medical officers apparently went into the Southern camps believing that they would meet with this disease most frequently, and if we accept their recorded diagnoses their expectations were certainly fully realized. It will be interesting for us to make an inquiry concerning the actual prevalence of malaria among these troops. In the first place, it is worthy of note that in the regimental records themselves there is evidence that malaria was not a prevalent disease at Chickamauga Park. This evidence is furnished by such illustrations as the following: The Second Brigade of the Second Division of the First Army Corps consisted of the One hundred and fifty-eighth Indiana, the Sixth Ohio, and the First West Virginia. These regiments were encamped side by side. From the regimental sick reports it appears that malaria prevailed in the Indiana regiment from May throughout the summer. There were no cases in the Ohio regiment in May, 3 in June, 11 in July, 103 in August, and 203 in September. In the First West Virginia Regiment the diagnosis of malaria does not appear on the regimental records until August, when 108 cases are reported. That there should have been malaria in the Indiana regiment in May and not a case in either of the other regiments in the same brigade is not probable; and that it could have required two months for this disease, had Chickamauga been the fearfully malarious place it is said by some to be, progressing slowly through the Ohio regiment, to reach the West Virginia regiment, is not in accord with any known epidemiological facts concerning this disease. We think that such unequal distribution of the disease as shown by the above-mentioned records is proof quite convincing that malaria was not widely prevalent among the troops at Chickamauga. We have already seen that practically all of the prolonged malarials were actually cases of typhoid fever. Many of the temporary illnesses diagnosed as malaria may actually have been due to the plasmodium, but how many were due to this cause we can not positively state.

It is to be regretted that qualified men properly equipped were not placed earlier at all the national

encampments, in order to make scientific diagnoses of malaria and typhoid fever. Scientific medicine would have been greatly enriched had this been done. As soon as we began the inspection of camps and hospitals we saw that it was absolutely necessary to provide for scientific diagnoses. In the division hospitals we found that most of the febrile cases were diagnosed malaria. We believed that they were typhoid fever, but it seemed presumptuous in us to set our opinion above that of the very competent medical officers in attendance. We therefore asked the Surgeon-General that he should send competent men properly equipped for making blood examinations for the malarial plasmodium and the Widal test to each of the large camps. The Surgeon-General acted promptly on this suggestion, and we are therefore able to give some scientific information concerning the actual prevalence of malaria.

At Sternberg Hospital, Chickamauga Park, Maj. R. Emmett Giffen, surgeon in command of the hospital, established a bacteriological laboratory and placed the same under the charge of Acting Asst. Surg. Charles F. Craig. The following is Doctor Craig's report of the work done in this laboratory:

REPORT OF THE BACTERIOLOGICAL LABORATORY TO NOVEMBER 1,
1898.

STERNBERG UNITED STATES GENERAL HOSPITAL,
Chickamauga Park, Ga.

To Maj. R. EMMETT GIFFEN,

Chief Surgeon, U. S. Volunteers, Commanding Hospital.

SIR: I have the honor to submit to you the following report regarding the work of the bacteriological laboratory up to the present date.

As it was your intention in establishing the laboratory to aid in the scientific study of the cases treated in the hospital and to investigate certain questions concerning the sanitary condition in Chickamauga, I have endeavored to follow your suggestions and orders as closely as possible.

I have had associated with me for a short time Acting Asst. Surg. George Dock, of Ann Arbor, Mich., a most competent and acknowledged authority upon the fevers of the South, especially malaria, and I have also been ably aided by Dr. James Jobling, whom you detailed to me as laboratory assistant.

The work in the laboratory has been divided as follows:

(a) The study of typhoid-fever cases, including post-mortem examinations and the use of Widal's test; (b) the examination of the blood of suspected cases for the plasmodium malariae; (c) the bacteriological analysis of water; (d) the chemical and microscopical examination of urine, including the diazo reaction; (e) the study of the blood of typhoid cases; (f) the study of cases of special interest.

(a) There have been 10 post-mortem examinations made of subjects dead of typhoid fever, all of which demonstrated the pathological changes usually found in that disease. I have made several preparations illustrating very perfectly the changes occurring in the intestine, showing swelling, infiltration, ulceration, and perforation of Peyer's patches, and swelling of the solitary glands.

Of special interest have been the results obtained by Widal's serum test in the typhoid cases in the hospital. I have examined to date 315 cases, using the Widal test, with the following results:

Of the 315 cases, 208 were diagnosed as typhoid fever, 5 were diagnosed as malaria, 13 were diagnosed as questionable typhoid,

20 were diagnosed as measles, 1 was diagnosed as typho-malaria, 1 was diagnosed as simple fever, 1 was diagnosed as myalgia, 2 were diagnosed as pneumonia, 1 was diagnosed as cystitis, 1 was diagnosed as tuberculosis, 1 was diagnosed as questionable tuberculosis, 1 was diagnosed as thermic fever, 2 were diagnosed as dysentery, and 58 had no diagnosis.

Of the 208 cases diagnosed as typhoid, 205 cases reacted to Widal's test, while 3 did not.

These cases, with the exception of one, have since proven not to be typhoid.

The one is still in doubt.

Of the 5 cases diagnosed malaria, 2 reacted to the test and were undoubtedly typhoid, while 3 did not react.

Of the 20 cases diagnosed as measles, not one reacted to the test.

Of the 13 cases diagnosed questionable typhoid, 7 gave reaction, while 6 gave no reaction.

One case diagnosed "typho-malaria" gave a very marked reaction, and examination of the blood demonstrated that no plasmodia were present. This case was undoubtedly a straight typhoid.

One case diagnosed myalgia gave no reaction.

Two cases diagnosed dysentery; one reacted and proved to be typhoid, one did not.

One case diagnosed tuberculosis gave no reaction.

One case diagnosed tuberculosis gave reaction and proved to be typhoid.

One case diagnosed cystitis gave no reaction.

Two cases diagnosed pneumonia gave no reaction.

One case diagnosed thermic fever gave no reaction.

One case diagnosed "simple fever" gave a reaction and proved to be typhoid.

Of the 58 cases having no diagnosis, 30 reacted to the test, while 28 did not. Of the 28 which did not, 10 were too recent for the reaction to appear.

I have divided the reactions to the test as follows:

1. Character of reaction: Marked, 150 cases; medium, 58 cases; slight, 27 cases.

2. Time of reaction: Immediate, 95 cases; in five minutes, 64 cases; in ten minutes, 38 cases; in fifteen minutes, 25 cases; in twenty minutes, 8 cases; in twenty-five minutes, 6 cases.

The slowest reaction observed was complete within twenty-five minutes.

The earliest reaction was obtained upon the fourth day of the disease, the latest upon the sixtieth day. There were five reactions at the fourth day, eight at the fifth, ten at the sixth, five at the seventh, the remaining reactions ranging from the eighth to the fortieth day of the disease.

From the foregoing report it will be seen that the Widal serum test proved the diagnosis of typhoid fever in 99 per cent of the cases so diagnosed, there being one case still in doubt, and it further proved that at least 80 per cent of the sick in this hospital were suffering from typhoid fever. In cases other than typhoid the test gave a negative result of 100 per cent.

The Widal test has thus proved its great utility, and the results obtained in this laboratory conclusively show its great value as a diagnostic measure, and its therapeutic use as indicating the treatment to be pursued in doubtful cases. Many of the reactions were very marked, and demonstrated beautifully the inhibitory action of typhoid blood serum upon the movements of bacillus of typhoid.

The cultures used in making the tests were twenty-four-hour cultures, obtained originally from pure cultures sent to the laboratory from the laboratory of the United States Army Medical Museum and the laboratory of Johns Hopkins University.

(b) The examination of suspected cases for the malarial plasmodium has resulted in the demonstration of only four cases of malaria in this hospital since the laboratory was established.

Acting Asst. Surg. George Dock, during his work in this laboratory, demonstrated the tertian organism in one case, and since his

departure I have found the quartan in one case and the æstivo-autumnal in two cases.

(c) The bacteriological analysis of the water of Chickamauga Park has been carefully and steadily carried on, and I have already submitted to you three reports upon the examination of certain waters which you wished analyzed.

The results may be summed up as follows:

Samples of water from the following localities have been examined:

Chickamauga Creek, at Intake Spring, on Cave Spring branch of creek, North Well, first well south of North Well, second well south of North Well, Upper Ellis Spring, Lower Ellis Spring, Mullis Spring, Kelly House Well, Kelly Field Well, Brotherton Well, the wells upon Snodgrass Hill road, and Dyer House Well, Blue Spring, and Cloud Spring.

The following water was found pure and fitted for domestic use: From Chickamauga Creek, if filtered; North Well, second well south of North Well, Upper Ellis Spring, Kelly House Well, Kelly Field Well, Dyer House Well, second well on Snodgrass Hill road, Blue Spring, and Cloud Spring.

The water from the following localities was condemned: Spring on Cave Spring branch of Chickamauga Creek (contained *B. coli. communis*); first well south of North Well, on Lafayette road (contained *proteus vulgaris*); Lower Ellis Spring (too much bacterial life); Mullis Spring (too much bacterial life); Brotherton Well (too much bacterial life).

I have been unable to demonstrate the typhoid bacillus in any of the water examined.

(d) The work in urinary analysis has been divided into chemical, microscopical, and bacteriological.

The chemical examinations have been conducted by Doctor Jobling, about 200 samples having been analyzed.

The microscopical and bacteriological examinations, conducted by myself, have thus far shown nothing of special interest, unless it be the occurrence in the urine of typhoid cases of numerous bacteria, chiefly micrococci.

The diazo reaction has been applied in a large number of cases, and, while always present in typhoid, it also occurred in other diseases.

(e) I have examined bacteriologically the blood of twelve cases of typhoid fever, and will submit to you shortly a special report concerning the conclusions arrived at.

(f) I have paid special attention to the study of individual cases presenting special symptoms, and especially to those cases simulating the so-called "typho-malarial" fever of older writers. Within the last month I have found two cases of undoubted double infection, the plasmodium malarie and the typhoid bacillus being present at the same time in the same case. These cases are of great interest, and I will submit to you a special report concerning them, together with charts, etc.

The laboratory has been in operation only about five weeks, but its value has been proven from a practical as well as a scientific standpoint to the hospital, and has demonstrated the wisdom of your course in establishing it.

Had laboratory facilities been possible or available when the troops were first sent to the park, much of the sickness and distress which followed might have been prevented.

A special report regarding the relation of flies and other insects to the spread of typhoid fever will be submitted to you as soon as it can be prepared.

Respectfully submitted.

(Signed)

CHAS. F. CRAIG,

Acting Assistant Surgeon, U. S. Army.

The following is a copy of the report of Professor Dock:

REPORT ON EXAMINATION OF BLOOD IN UNITED STATES ARMY HOSPITALS, SEPTEMBER, 1898.

By GEORGE DOCK, M. D., of Ann Arbor, Mich.

On September 7 I received orders to proceed to Sternberg Hospital, Chickamauga, Ga. Arriving September 9, I received every aid and encouragement from the chief surgeon, Maj. R. E. Giffen. I found that Acting Asst. Surg. C. F. Craig had fitted up a laboratory for bacteriological investigations, and must here express my thanks for the courtesy with which he put at my disposal all the apparatus and a place for working. I therefore lost no time in beginning my investigations. I soon discovered that many cases were diagnosed "malaria" without any obvious reason so far as the well-known clinical peculiarities of malarial disease are concerned and without any attempt at differential diagnosis between malaria and typhoid fever. In some wards many cases were diagnosed malarial, in others none. I went through one of these wards with the acting assistant surgeon in charge, but the "dozens of cases of typical malaria" he said he had was, reduced to one doubtful case on examination of the history, temperature chart, and patient. Microscopic examination of the blood showed no parasites, and the Widal test was quickly positive. In this way a number of cases thought to be malarial were examined. In all the blood was free from parasites, the Widal test positive. Having made all the examinations requested by the surgeons, I began a personal examination of the patients, going through each ward in order, examining all the fever cases and making examinations of the fresh blood in all cases that seemed doubtful or otherwise important. In most of the cases quinine had been given, usually in large doses, up to 40 grains a day. This would have interfered with the examination in general, but inasmuch as the symptoms continued, the diagnoses were in some cases "continued malaria," "typho-malaria," or "mixed infection," and the surgeons in charge still adhered to the malarial character; many examinations were made in such cases, always with negative results. Out of 65 cases in which the blood was examined, 5 had had no quinine at all; 5 more had had none for several days before the examinations were begun. Among the former I included a case that had had one dose (0.6 gram) of quinine a few hours before the examination, and the only case in which parasites were found. This case was important in a number of ways. The notes are as follows:

Private McIntyre, Company H, Second Arkansas, ill five days with fever, slight chills, "pain all over," no nausea or vomiting. The bowels have been constipated. The tongue moderately large, the edge and tip rather red, the dorsum moist, with a thin white coat. The abdomen is retracted; pain in the epigastrium; there are no spots. The spleen can be easily felt an inch below the margin of the ribs; the edge is rounded and rather soft. The temperature on admission was 103.5°; it rose the same day to 104.3°; fell during the night to 101.5°, rose again to 104.2°, remaining there for several hours, then fell to 99.5°; rose soon after to 99.8°, where it remained until next day, the fourth after admission. It then rose from about 8 a. m. and reached 105.3° at 4 p. m. In the afternoon there was a slight chill. The temperature fell slowly, without sweating. The written diagnosis was typhoid fever. I saw the patient at 9.30 a. m. of this day, and being struck by the large size of the spleen, unusual at so early a stage in typhoid

^aThe comparatively small number of cases examined depends partly on the time spent in selecting promising cases out of a large number, often without temperature charts or histories, but more especially on the fact that in cases with negative results the examination is necessarily prolonged much beyond the time usually necessary to find germs in a positive case. In all examinations at least two good preparations were examined, and in some cases as many as ten examinations were made at different times.

fever, examined the blood. I must say that the appearance of the patient was not unlike that of one in the early stage of typhoid fever. The temperature was 100.4°. I found large numbers of parasites, almost every field ($\frac{1}{12}$ inch oil immersion) containing one. Most of them were in the small amoeboid stage, from $\frac{1}{4}$ to $\frac{1}{2}$ the diameter of the red corpuscles, and with fine pigment grains. There were also a few parasites in a more advanced stage almost filling the red cells, but without any signs of segmentation. The indications were that the patient had a double tertian infection, with one generation not numerous enough, in all probability, to produce a marked paroxysm. Soon after the examination the patient received a second dose of 0.6 gram of quinine, and the temperature fell to 98.5° at noon. Not knowing about the quinine at first, I was surprised to find the parasites disappearing about an hour after their discovery, and those present were in very slow motion. The temperature rose to 100.4°, then fell during the night to 98.5°, and remained below normal up to the time the patient was discharged, ten days later. Parasites were found for two days after defervescence. They were rare the last time they were found and almost motionless. The subjective sensations improved with the fall of the temperature and the patient remained well, having taken in all 1.2 grams of quinine (18.5 grains). The patient said he had chills in Arkansas in the spring.

I have described this case rather fully because it seems of considerable importance in more than one respect. In the first place it shows how a double-tertian malarial infection may easily simulate typhoid for a short time. (It seems worth noting that the surgeon in charge, Acting Assistant Surgeon Pinckney, is familiar with malarial fever in Charleston, S. C.) More important is the fact that, notwithstanding the peculiarity mentioned, a moderate dose of quinine at once cut the disease short, although, as is always the case, the organisms persisted for a short time after complete defervescence. From this fact and the ease with which recovery followed, it is not probable that the large number of cases diagnosed "malaria" were malarial alone, since almost all of them were treated with quinine, usually in larger doses than in this case. Many of them had from 1.5 to 2.5 grams daily for periods up to three weeks without any notable effect on the temperature. On the other hand, it is quite probable a few cases of fever that appear in the reports were really of malarial nature. In a number of cases I obtained histories from men that seem to have been malarial. But these rapidly recovered under the inevitable quinine. As a rule these patients were treated in quarters or in regimental hospitals, so that no charts were kept. I was unable to see any of these cases soon after defervescence while at Sternberg Hospital, but was more fortunate at Camp Meade.

The intensity of malarial infection in a locality like Chickamauga Park in summer can be estimated in general by the number of cases of simple intermittent fever observed. I know of no reliable statistics in the camp, but from my own investigations think the number must have been very small. I am confirmed in my belief by information kindly furnished by Maj. F. P. Robinson, surgeon of the Sixth United States Volunteers, who told me that in the two months his regiment was encamped in the park he had not had more than six cases of simple intermittent fever.

While the evidence for frequent malarial infection is, therefore, lacking, the clinical features of a very large proportion of the fever cases were those of typhoid fever, not differing on the whole from that disease as seen in other parts of the country, as well as in Europe. In some cases the skin and mucous membranes showed evidences of lack of care (bedsore, multiple abscess, ulcers of the mouth). Some cases showed marked depression, sometimes perhaps due to the large doses of quinine or to other antipyretics, or to overdoses of whiskey (half ounce every two hours from the time of admission). The course of the temperature in most cases was characteristic; the enlargement of the spleen was evident in many. The roseolar eruption was often present, but sometimes masked by innumerable spots due to flies and other insects. Blue spots I

saw in three cases, in all of which lice had apparently been present, but were not when I saw the patients. The stools in most cases were quite characteristic. In all the blood examinations on uncomplicated cases I made the leucocytes were diminished, or at least not increased. The Widal test was made in a number of cases by myself, confirming or clearing up the diagnosis. This test was made on a most extensive scale by Acting Assistant Surgeon Craig, who will report his results.

In two cases I made autopsies on the bodies of patients dead of typhoid fever. I append brief notes:

Charles Kirk, musician, Company B, Fourteenth New York, 18 years old. Admitted to Sternberg Hospital September 5, in ward of Acting Assistant Surgeon Barnhart. Patient felt ill one or two days before admission. Diagnosis: Typhoid fever. Temperature moderately high; marked delirium; for three days before death, vomiting and involuntary discharge of watery stools. Died September 15, 1898. Examined one hour after death. No rigor mortis; slight lividity on the back; face dusky; muscles dry and dark red; no Zenker's degeneration. Lungs collapsed, slight hypostatic congestion of the left lower lobe; rest of lungs anemic; free from lesions. Pleurae not diseased. Pericardium normal. Heart distended with fluid, dark blood; muscles firm and of normal appearance; valves normal. Spleen very large, estimated weight 1½ pounds; capsule smooth, section dark red; anemic; Malpighian bodies distinct. Kidneys slightly enlarged; pale; cortex wide; parenchyma, cloudy; Malpighian bodies prominent; pyramids, anemic. Ureters, negative. Bladder empty. The serosa of the ileum is red for about 2 feet above the valve. The appendix is red and swollen. The mesenteric glands are enlarged; red; those corresponding to the lower end of the ileum reaching the size of pigeon eggs. The mucous membrane of the stomach is red and ecchymosed. The ileum shows great swelling of the mucous membrane, folds being present all the way to the valve. The lower 5 feet of the gut show swelling of the solitary glands and Peyer's patches, the former reaching a diameter of 8 millimeters. Most of the lymphoid tissue is in the stage of medullary infiltration, but a few solitary nodules show superficial necrosis. The mucosa of the valve, the caecum, and appendix are red and swollen. Two of the largest mesenteric glands contain necrotic foci. The liver is large, the surface rough, section pale, acini distinct; the consistency is tough; the capsule of Glisson, increased. There are a few small gray areas on the section. Gall bladder full, not altered; the lymph glands at the neck are large and red.

Microscopic examination of the spleen pulp showed the absence of malarial pigment. Eberth's bacilli were cultivated from the spleen by Acting Assistant Surgeon Craig.

Case 11. Private Pudil, Company H, Thirty-first Michigan. Acting Assistant Surgeon Norris. Patient came from Knoxville to visit relatives. While in ward was noticed by surgeon in charge, who found a temperature of 104° F. Patient was sick two weeks after that, having fever rarely less than 103.5° F.; anxious and delirious all the time. September 11 there was a slight hemorrhage. September 15, complained of pain in the abdomen, which was found rigid. Diagnosis of perforation and peritonitis. Death, September 16.

Autopsy showed slight hypostatic congestion of both lungs; spleen enlarged; the lower end contained a hemorrhagic infarction 4 centimeters in diameter. The peritoneum is red, swollen, and rough all over, containing about a quart of thin, yellow, watery fluid containing yellow flakes of fibrin; and in the pelvis a small amount of thin yellow feces. The liver and spleen are also covered with thin fibrinous exudate. The serous surface of the lower part of the ileum is dark red or violet. About a foot above the caecum is a perforation 2 by 4 millimeters in diameter. The mesenteric glands are moderately enlarged. The mucosa of the ileum is moderately swollen. The Peyer's patches and solitary glands in the upper part of the diseased area are swollen, but with pitted, or reticulated, or gray surfaces. The Peyer's patches in the lower 3 feet of the ileum are ulcerated; some to the inner,

some to the outer muscular coat; one, 2 centimeters in diameter, to the serosa in a small part, without perforating. The perforating ulcer is 2.5 centimeters in diameter. Some of the ulcers have thickened edges, some not; all are clean, and a large one just above the valve is covered with healthy granulations. The mucous membrane of the cæcum is swollen and of dark violet color. The left kidney contains an anemic infarct 1 inch in diameter. The pelvis is red, swollen, and contains thin opaque mucous fluid. Bladder, unaltered.

Microscopic examination of the splenic pulp shows absence of malarial pigment.

In Knoxville I examined the blood of 14 patients diagnosed as having malarial or "typho-malarial" fever. In one case the diagnosis was "malarial jaundice," though the history pointed rather to acute indigestion, and there had been no actual icterus. Quinine had been used in all cases. The blood in all was negative. I saw a great many cases diagnosed malaria that were evidently typhoid, but all had taken quinine in large doses.

In the division hospital I became acquainted with a major and surgeon who had been making diagnoses of malaria ostensibly by the use of the microscope, both at Chickamauga and later at Knoxville. I was convinced that he was totally unable to recognize malarial parasites. Experts need only to be told, by way of proof, that in all cases he found the so-called parasites in large numbers, usually, as he said, in every red corpuscle. He demonstrated his inability to distinguish between red and white corpuscles in his own blood.

When I arrived at Camp Meade I found comparatively few cases with the diagnosis of malaria in the Second Division Hospital. Most of the surgeons claimed that malarial disease was very rare there. I found two wards, the so-called malarial wards (3 and 4), in which a great many cases had the diagnosis of malaria. I examined the blood of many of these, also of many recently admitted men and some suspicious cases in the other wards, to the number of 20, but without finding any parasites. As the bacteriological outfit was incomplete, Widal tests could not be made, but out of the so-called malarial cases at least two-thirds were evidently typhoid in the middle stage, some not yet definitely recognizable, and some convalescent. Some of the other cases appeared to be convalescent from malaria, without typhoid manifestations.

In the First Division Hospital I was told there were a great many cases of malaria and typho-malarial fever. Several so-called typical cases of the latter had no parasites, and were evidently uncomplicated cases of typhoid fever. One case proved to be malaria and is quite as instructive as the positive case found at Chickamauga.

Private Beyer, Company F, Fifteenth Pennsylvania, came two weeks before examination from Fort Sheridan (?), on the Potomac River. Four days later he began to have chills, and had, so far as he knows, three chills, tertian (?). He felt quite well the free days. The temperature had not been taken often enough to give the type. There had been a chill the day before examination, and the patient had taken 24 grains of quinine in two days. Soon after beginning the examination I found an organism almost filling a red blood corpuscle. I thought the patient was nearing a paroxysm, but on examining the preparation further I found no other parasites in two very good covers. The temperature taken then was 98° F., and the patient felt well. He had no doubt recovered for the time being, furnishing another example of the ease with which such infections can be broken up. Like the case previously described, he came to camp already infected. As a matter of diagnostic interest, it may be added that this was the only case among several hundred with fever examined by me with herpes on the lips.

To summarize: I found remarkably little evidence that malaria was prevalent in Sternberg Hospital, in Camp Meade, and in the division hospital at Knoxville, the only cases found having been imported.

Malarial infection was probably more common than the results of my blood examinations indicate, but was easily broken up, and malaria was an inconsiderable factor in the large number of fever cases that appear under various names in the hospital records of those camps.

I found no evidence of combined typhoid and malarial infection. Among so large a number of cases of typhoid fever in men from all parts of the country some cases of that kind must have occurred. The examinations of experienced observers, and especially of those who had opportunities for making autopsies in the city hospitals, to which many patients were sent with the diagnosis of "malaria," will be of great interest in this connection.

The nomenclature of fevers in the camps named was on the whole irrational and arbitrary.

GEORGE DOCK.

ANN ARBOR, MICH., October 17, 1898.

INTESTINAL DISORDERS IN THE FIRST AND THIRD ARMY CORPS.

Intestinal disorders were very common among these troops. It is safe to say that at least two-thirds of the officers and men at Chickamauga suffered more or less from some form of intestinal disturbance. These intestinal disturbances were recorded under different names according to the individual views of the surgeon in charge. Gastritis, gastro-enteritis, and enteritis seemed to have been favorite expressions under which many regimental surgeons recorded these cases. In some regimental records the above-mentioned terms appear almost to the exclusion of the word "diarrhea;" while in other regiments nearly all of these cases were recognized as acute diarrhea, which certainly was the correct diagnosis. We have carefully searched the records and fail to find any evidence of the existence of a case of amebic dysentery among these soldiers. In fact, true dysentery was certainly very rare. Most of the cases of intestinal disorder were diarrheas in which the lower part of the large intestine only was affected. In a few instances ulceration resulted. In most cases there was no elevation of temperature, and the men were excused from duty for from one to three days. We are inclined to attribute the diarrheas to infection with saprophytic germs brought from the sinks and deposited on the food by flies.

The relation of the intestinal disorders to typhoid fever is of considerable interest to us, and we have already gone somewhat extensively into this subject in the histories of the Sixth Ohio and the First West Virginia regiments. This matter is of sufficient importance to justify us in inquiring into it further. In the first place, it should be stated that the regimental surgeons followed no definite rules in their reports of intestinal disorders. Some of them evidently recorded every case reported to them, while others made record of only the more serious ones.

In the First Arkansas Volunteer Infantry 359 cases of diarrhea are recorded. In the same regiment there were 228 cases of probable typhoid fever. Sixty of the individuals who had typhoid fever had had some

previous intestinal disturbance. We have already called attention to the fact that in many instances the preceding intestinal disorder was evidently a part of the typhoid process. The following cases from this regiment are illustrations of this relation:

- No. 1. Dysentery, August 15 to 18; typhoid fever, August 20; furloughed August 21.
 No. 2. Diarrhea, June 14 to 16; typhoid fever, June 22; furloughed August 17.
 No. 3. Diarrhea, August 2 to 6; typhoid fever, August 14; furloughed August 23.
 No. 4. Dysentery, August 5 to 10; gastritis, August 16 to 18; continued fever, August 19; died September 19.
 No. 5. Gastritis, June 2 and 3; typhoid fever, June 10.
 No. 6. Diarrhea, July 7 to 10; typhoid fever, July 31; died August 9.
 No. 7. Diarrhea, August 10 to 16; typhoid fever, August 20.
 No. 8. Diarrhea, May 30 to 31; dysentery, June 2 and 3; typhoid fever, June 16.
 No. 9. Diarrhea, August 1 and 2; typhoid fever, August 12.
 No. 10. Dysentery, July 31 to August 3; typhoid fever, August 16.
 No. 11. Diarrhea, July 20 to 31; typhoid fever, August 2.
 No. 12. Diarrhea, June 7 to 10; typhoid fever, July 3.
 No. 13. Diarrhea, July 28 to 31; typhoid fever, August 15.
 No. 14. Diarrhea, July 26 and 27; typhoid fever, August 16.
 No. 15. Diarrhea, July 28 and 29; typhoid fever, August 19.
 No. 16. Diarrhea, August 29 to September 2; typhoid fever, September 7.
 No. 17. Diarrhea, July 29 to August 2; typhoid fever, August 15.
 No. 18. Diarrhea, August 6 to 12; typhoid fever, August 16.
 No. 19. Diarrhea, July 12 and 13; typhoid fever, August 31.
 No. 20. Diarrhea, May 30 and 31; diarrhea, June 15 to 18; typhoid fever, June 19.
 No. 21. Diarrhea, June 8 to 11; typhoid fever, June 24.
 No. 22. Diarrhea, June 6 and 7; typhoid fever, June 12.
 No. 23. Gastritis, August 19 and 20; typhoid fever, August 23.

It is possible that in all of these cases the intestinal disorder that preceded the typhoid fever occurred about the time of the typhoidal infection. We are inclined to believe that in many of these instances the infection was a mixed one and that the effect of this mixed infection was a diarrhea.

Of the 228 cases of probable typhoid fever in the First Arkansas Volunteer Infantry, 168 had no illness, so far as the record shows, preceding the typhoid fever. In other words, 73.68 per cent of the cases of typhoid fever were not preceded by any recorded intestinal disorder, while 26.32 per cent of the cases of typhoid fever were preceded by some intestinal disorder. However, in 23 out of the 60 cases which were preceded by some intestinal disorder the preceding intestinal disorder was probably due to the typhoid infection.

In the Fifty-second Iowa Volunteer Infantry there are recorded 691 cases of diarrhea, and there were in this regiment 345 cases of probable typhoid fever; 99 of the cases of probable typhoid fever were preceded by some recorded intestinal disorder. Of these the following may be of interest:

- No. 1. Diarrhea, August 13 to 18; typhoid fever, August 24.
 No. 2. Diarrhea, August 2 to 8; typhoid fever, August 15.
 No. 3. Diarrhea, August 14 to 17; typhoid fever, August 18.
 No. 4. Diarrhea, August 26 to 30; typhoid fever, September 7.

- No. 5. Diarrhea, August 2 and 3; typhoid fever, August 11.
 No. 6. Diarrhea, July 9 and 10; typhoid fever, July 25.
 No. 7. Diarrhea, July 11 to 13; typhoid fever, July 20.
 No. 8. Diarrhea, August 20 to 22; typhoid fever, August 28.
 No. 9. Diarrhea, July 31 to August 4; typhoid fever, August 19.
 No. 10. Diarrhea, August 20 to 26; typhoid fever, August 30.
 No. 11. Diarrhea, August 13 to 17; indigestion, August 18 to 20; typhoid fever, August 30.
 No. 12. Diarrhea, August 21 to 27; typhoid fever, August 30.
 No. 13. Diarrhea, August 4 and 5; typhoid fever, August 16.
 No. 14. Diarrhea, August 19 and 20; typhoid fever, August 21.
 No. 15. Diarrhea, July 20 to 22; diarrhea, July 24 and 25; typhoid fever, July 29.
 No. 16. Diarrhea, July 30 to August 18; typhoid fever, August 31.
 No. 17. Diarrhea, August 20 to 22; typhoid fever, August 24.
 No. 18. Diarrhea, August 15 to 19; typhoid fever, August 26.
 No. 19. Diarrhea, July 9 to 16; typhoid fever, August 3.
 No. 20. Diarrhea, August 19 to 24; typhoid fever, August 30.
 No. 21. Diarrhea, August 11 and 12; typhoid fever, August 13.
 No. 22. Diarrhea, July 3 and 4; diarrhea, July 9 to 16; diarrhea, July 23 to 26; typhoid fever, August 13.
 No. 23. Diarrhea, August 13 and 14; typhoid fever, August 31.
 No. 24. Diarrhea, July 5 and 6; typhoid fever, July 15.

We believe that in these cases it is more than probable that the preceding intestinal disorder resulted from a mixed infection, from which typhoid fever developed later. The following summary will show the principal facts concerning the relation between typhoid fever and intestinal disorders in this regiment:

Number of cases of intestinal disorder.....	691
Number of cases of probable typhoid fever.....	345
Number of cases of probable typhoid fever not preceded by any recorded intestinal disorder.....	246
Percentage of cases of probable typhoid fever not preceded by any recorded intestinal disorder.....	71.30
Number of cases of probable typhoid fever in which the preceding intestinal disorder probably had some relation to the subsequent typhoid fever.....	24

In the Second Missouri Volunteer Infantry 400 cases of intestinal disturbance are reported, while the number of probable typhoids was 268; 47 individuals appear on both of these lists. In the following cases a direct relation between the preceding intestinal disorder and the typhoid fever is regarded as probable:

- No. 1. Diarrhea, July 1 to 10; typhoid fever, July 14.
 No. 2. Diarrhea, September 6 and 7; typhoid fever, September 8.
 No. 3. Diarrhea, June 7 and 8; diarrhea, June 17 to 20; typhoid fever, June 28.
 No. 4. Diarrhea, August 15 to 17; typhoid fever, August 30.
 No. 5. Diarrhea, September 2 to 5; typhoid fever, September 8.

The following summary will show the principal facts concerning the relation between typhoid fever and intestinal disorders in this regiment:

Number of cases of intestinal disorder.....	400
Number of cases of probable typhoid fever.....	268
Number of cases of probable typhoid fever not preceded by any recorded intestinal disorder.....	121
Percentage of cases of probable typhoid fever not preceded by any recorded intestinal disorder.....	45.15
Number of cases of probable typhoid fever in which the preceding intestinal disorder probably had some relation to the subsequent typhoid fever.....	5

In the Ninth New York Volunteer Infantry the number of cases of diarrhea was 497, while the cases of typhoid fever numbered 323; 73 individuals appear on both of these lists. In the following cases it is probable that the preceding intestinal disorder had some relation to the typhoid fever:

- No. 1. Intestinal colic, July 30 and 31; typhoid fever, August 1.
- No. 2. Diarrhea, July 30 and 31; typhoid fever, August 3.
- No. 3. Gastritis, July 15 to 20; typhoid fever, July 26.
- No. 4. Diarrhea, July 5 and 6; typhoid fever, July 10.
- No. 5. Diarrhea, August 21 to 28; typhoid fever, September 10.
- No. 6. Diarrhea, July 2 to 5; typhoid fever, July 9.
- No. 7. Diarrhea, August 8 and 9; typhoid fever, August 19.
- No. 8. Diarrhea, August 12 and 13; typhoid fever, August 30.
- No. 9. Gastritis, July 30 to August 1; typhoid fever, August 7.
- No. 10. Dysentery, August 27 to 29; typhoid fever, August 30.
- No. 11. Diarrhea, June 9 to 12; typhoid fever, June 29.
- No. 12. Diarrhea, July 2 and 3; diarrhea, July 6 to 8; typhoid fever, July 19.
- No. 13. Intestinal colic, June 1 and 2; typhoid fever, June 10.
- No. 14. Diarrhea, July 18 to 29; typhoid fever, July 30.
- No. 15. Gastro-duodenitis, July 1 and 2; typhoid fever, July 28.
- No. 16. Gastro-enteritis, August 2 to 8; typhoid fever, August 17.
- No. 17. Diarrhea, July 29 to 31; typhoid fever, August 4.
- No. 18. Diarrhea, August 28 to 30; typhoid fever, September 5.
- No. 19. Indigestion, June 5 and 6; typhoid fever, June 14.
- No. 20. Diarrhea, August 18 to 20; typhoid fever, September 1.
- No. 21. Diarrhea, July 10 and 11; typhoid fever, July 20.
- No. 22. Diarrhea, June 25 and 26; typhoid fever, July 6.
- No. 23. Diarrhea, August 23 to 28; typhoid fever, September 3.
- No. 24. Diarrhea, August 13 to 16; typhoid fever, August 20.
- No. 25. Diarrhea, July 16 and 17; typhoid fever, July 18.
- No. 26. Diarrhea, August 22 and 23; typhoid fever, August 24.
- No. 27. Diarrhea, July 25 to 27; typhoid fever, July 30.
- No. 28. Intestinal colic, July 12 to 17; typhoid fever, July 18.

The following summary will show the principal facts concerning the relation between typhoid fever and intestinal disorders in this regiment:

Number of cases of intestinal disorder.....	497
Number of cases of probable typhoid fever.....	323
Number of cases of probable typhoid fever not preceded by any recorded intestinal disorder.....	250
Percentage of cases of probable typhoid fever not preceded by any recorded intestinal disorder.....	77.39
Number of cases of probable typhoid fever in which the preceding intestinal disorder probably had some relation to the subsequent typhoid fever.....	28

In the Sixty-ninth New York Volunteer Infantry the number of cases of recorded diarrhea is less than the number of cases of probable typhoid fever. This is the only regiment in which we found this to be the case. The number of diarrheas recorded amounts to 205, while there are 299 cases of probable typhoid fever; the number of individuals whose names are found in both of these lists is 57. In the following cases there is probably some relation between the preceding intestinal disorder and the typhoid fever:

- No. 1. Diarrhea, June 19 and 20; typhoid fever, July 9.
- No. 2. Gastritis, October 2 to 12; typhoid fever, October 16.
- No. 3. Dysentery, September 20 to 27; typhoid fever, October 1.
- No. 4. Dysentery, September 19 to 30; typhoid fever, October 11.
- No. 5. Diarrhea, July 20 to 24; typhoid fever, July 24.

No. 6. Gastritis, September 13 to 18; typhoid fever, September 18.

No. 7. Dysentery, July 19 to 24; typhoid fever, August 8.

No. 8. Dysentery, September 26 to October 1; typhoid fever, October 11.

No. 9. Dysentery, July 28 and 29; typhoid fever, August 3.

No. 10. Dysentery, August 2 to 8; typhoid fever, August 17.

No. 11. Diarrhea, July 17 and 18; typhoid fever, July 20.

No. 12. Diarrhea, July 18 to 21; typhoid fever, July 30.

No. 13. Dysentery, October 13 to 19; typhoid fever, October 23.

The following summary will show the principal facts concerning the relation between typhoid fever and intestinal disorders in this regiment:

Number of cases of intestinal disorder.....	205
Number of cases of probable typhoid fever.....	299
Number of cases of probable typhoid fever not preceded by any recorded intestinal disorder.....	222
Percentage of cases of probable typhoid fever not preceded by any recorded intestinal disorder.....	74.24
Number of cases of probable typhoid fever in which the preceding intestinal disorder probably had some relation to the subsequent typhoid fever.....	13

In the Eighth Massachusetts Volunteer Infantry 2,250 cases of intestinal disorder and 272 cases of probable typhoid fever are recorded; the names of 109 individuals are common to both of these lists. In the following cases the preceding intestinal disorder is regarded as having some relation to the typhoid fever:

No. 1. Gastro-enteritis, August 20 to 28; gastro-enteritis, September 1 to 13; diarrhea, October 11 to 15; sent to Fort Thomas with typhoid fever October 24. There can be but little doubt that this man was convalescing from typhoid fever when sent to Fort Thomas, and that the initial date of this disease should be given as August 20.

No. 2. Gastro-enteritis, August 30 to September 1; typhoid fever, September 7.

No. 3. Diarrhea, August 8 to 26; typhoid fever, September 3.

No. 4. Gastro-enteritis, September 10 to 15; typhoid fever, September 27.

No. 5. Gastro-enteritis, August 21 to 26; typhoid fever, September 7.

No. 6. Gastro-enteritis, September 10 to 17; typhoid fever, September 23.

No. 7. Diarrhea, August 15 and 16; typhoid fever, August 23.

No. 8. Gastro-enteritis, September 9 to 13; gastro-enteritis, September 19 to 22; typhoid fever, September 23.

No. 9. Gastro-enteritis, August 27 to September 1; typhoid fever, September 4.

No. 10. Diarrhea, August 9 to 15; diarrhea, August 30 to September 4; typhoid fever, September 25.

No. 11. Diarrhea, August 10 to 16; typhoid fever, August 17.

No. 12. Diarrhea, July 16 to 22; typhoid fever, July 23.

No. 13. Gastro-enteritis, September 11 to 13; gastro-enteritis, September 19 to 21; gastro-enteritis, September 27 to 30; typhoid fever, October 8.

No. 14. Gastro-enteritis, September 5 to 9; typhoid fever, September 24.

No. 15. Gastro-enteritis, September 8 to 12; typhoid fever, September 20.

No. 16. Gastro-enteritis, September 15 to 24; typhoid fever, October 3.

No. 17. Gastro-enteritis, August 9 to 14; typhoid fever, August 30.

No. 18. Acute diarrhea, August 9 to 14; typhoid fever, August 19.

No. 19. Gastritis, September 18 to October 24; gastritis, October 24 to November 4; typhoid fever, November 5.

No. 20. Gastritis, October 11 to 13; gastritis, October 15 to 20; typhoid fever, November 2.

No. 21. Gastritis, September 5 to 12; typhoid fever, September 29.

No. 22. Gastritis, September 19 and 20; typhoid fever, September 28.

No. 23. Diarrhea, August 26 to 28; gastro-enteritis, September 2 to 17; gastro-enteritis, September 19 to 25; typhoid fever, October 8.

No. 24. Gastro-enteritis, August 31 to September 6; gastro-enteritis, September 19 to 25; typhoid fever, October 5.

No. 25. Gastro-enteritis, September 6 to 11; typhoid fever, September 11.

No. 26. Gastro-enteritis, September 30 to October 2; typhoid fever, October 5.

No. 27. Gastro-enteritis, September 27 to 30; typhoid fever, October 5.

No. 28. Gastro-enteritis, September 10 to 18; typhoid fever, October 3.

No. 29. Gastro-enteritis, September 10 to 15; typhoid fever, September 24.

No. 30. Gastro-enteritis, August 22 to 26; typhoid fever, September 5.

No. 31. Gastro-enteritis, August 26 to September 1; gastro-enteritis, September 9 to 13; gastro-enteritis, September 15 to 30; typhoid fever, October 7.

No. 32. Diarrhea, August 4 to 6; typhoid fever, August 9.

No. 33. Gastro-enteritis, September 14 to 16; typhoid fever, September 16.

No. 34. Gastro-enteritis, September 9 to 13; typhoid fever, September 13.

No. 35. Diarrhea, August 11 and 12; gastro-enteritis, August 13 to September 6; diarrhea, September 7 and 8; diarrhea, September 8 to 20; gastro-enteritis, September 27 to October 5; convalescing from typhoid fever, November 5.

No. 36. Diarrhea, September 7 and 8; typhoid fever, September 14.

No. 37. Diarrhea, August 13 to 16; typhoid fever, August 16.

No. 38. Diarrhea, August 14 and 15; typhoid fever, August 18.

No. 39. Gastritis, August 19 to 22; typhoid fever, August 23.

No. 40. Gastro-enteritis, August 28 to September 5; gastro-enteritis, September 5 to 14; typhoid fever, September 29.

No. 41. Gastro-enteritis, August 27 and 28; typhoid fever, September 4.

No. 42. Diarrhea, August 13 and 14; gastro-enteritis, August 20 to September 15; typhoid fever, September 29.

No. 43. Gastro-enteritis, August 27 and 28; typhoid fever, September 1.

No. 44. Gastro-enteritis, September 6 to 8; typhoid fever, September 8.

No. 45. Gastritis, August 27 to September 2; typhoid fever, September 3.

No. 46. Gastro-enteritis, September 28 to October 7; typhoid fever, October 7.

No. 47. Gastro-enteritis, August 31 to September 5; typhoid fever, September 5.

No. 48. Diarrhea, August 9 to 14; typhoid fever, September 6.

No. 49. Diarrhea, August 9 and 10; diarrhea, August 11 to 18; typhoid fever, September 3.

No. 50. Diarrhea, August 19 to 22; diarrhea, August 27 to September 1; typhoid fever, September 4.

No. 51. Diarrhea, August 27 and 28; typhoid fever, August 29.

No. 52. Diarrhea, August 31 to September 2; typhoid fever, September 2.

No. 53. Gastro-enteritis, September 4 to 12; typhoid fever, September 12.

No. 54. Gastro-enteritis, August 22 to 26; gastro-enteritis, August 30 to September 2; gastro-enteritis, September 4 to 15; typhoid fever, September 15.

No. 55. Gastro-enteritis, September 1 to 18; typhoid fever, September 19.

No. 56. Gastro-enteritis, September 16 to 22; gastro-enteritis, September 27 to October 7; typhoid fever, October 14.

No. 57. Gastro-enteritis, September 21 to 28; typhoid fever, October 11.

No. 58. Gastro-enteritis, September 4 to 11; typhoid fever, September 11.

It will be seen that in many of the above given cases the preceding intestinal disorder could not have been other than a part of the typhoid fever itself. The following summary will show the principal facts concerning the relation between typhoid fever and intestinal disorders in this regiment:

Number of cases of intestinal disorder.....	2,250
Number of cases of probable typhoid fever.....	272
Number of cases of probable typhoid fever not preceded by any recorded intestinal disorder.....	163
Percentage of cases of probable typhoid fever not preceded by any recorded intestinal disorder.....	59.92
Number of cases of probable typhoid fever in which the preceding intestinal disorder probably had some relation to the subsequent typhoid fever.....	58

In the Second New York Volunteer Infantry 822 cases of intestinal disorder and 161 cases of probable typhoid fever are recorded; the names of 56 individuals appear upon both of these lists. In the following cases there is most probably some relation between the preceding intestinal disorder and the typhoid fever:

- No. 1. Acute diarrhea, July 12 and 13; typhoid fever, August 4.
- No. 2. Diarrhea, July 15 to 17; typhoid fever, August 8.
- No. 3. Diarrhea, August 3 to 6; typhoid fever, August 12.
- No. 4. Diarrhea, August 1 to 7; typhoid fever, August 20.
- No. 5. Diarrhea, July 21 and 22; typhoid fever, August 14.
- No. 6. Indigestion, August 12 to 14; typhoid fever, August 20.
- No. 7. Diarrhea, July 16 and 17; typhoid fever, August 8.
- No. 8. Diarrhea, July 9 and 10; diarrhea, July 18 to 19; typhoid fever, August 5.
- No. 9. Indigestion, August 22 to 24; typhoid fever, August 29.
- No. 10. Diarrhea, July 20 and 21; typhoid fever, July 26.
- No. 11. Diarrhea, July 16 and 17; diarrhea, July 20 to 23; typhoid fever, July 31.
- No. 12. Diarrhea, July 28 to August 2; typhoid fever, August 20.
- No. 13. Diarrhea, July 31 to August 1; typhoid fever, August 15.
- No. 14. Diarrhea, July 3 to 9; typhoid fever, July 10.

The following summary will show the principal facts concerning the relation between typhoid fever and intestinal disorders in this regiment:

Number of cases of intestinal disorder.....	822
Number of cases of probable typhoid fever.....	161
Number of cases of probable typhoid fever not preceded by any recorded intestinal disorder.....	105
Percentage of cases of probable typhoid fever not preceded by any recorded intestinal disorder.....	65.21
Number of cases of probable typhoid fever in which the preceding intestinal disorder probably had some relation to the subsequent typhoid fever.....	14

The relation of the intestinal disorders to typhoid fever became more prominent as the season advanced. The intestinal disorders of May and June very infrequently show any relation to typhoid fever, while those of July and August frequently show such a rela-

tion. Apparently, the diarrheas of May and June had no protective influence against subsequent infection with typhoid fever, while there can be but little doubt that the diarrheas of July and August did show such a protective influence. We have already suggested an explanation for this in our discussion of the history of the Eighth New York. Since writing that part of the report, we have gone minutely into the history of other regiments, and the opinion expressed at that place has been confirmed by our subsequent studies.

Our conclusions concerning the relation between intestinal disorders and typhoid fever among the troops of the First and Third Army Corps may be summarized as follows:

(1) A large proportion (averaging at least 75 per cent) of the cases of typhoid fever were not preceded by any intestinal disorder.

(2) In a fair proportion of the cases of typhoid fever which were preceded by some intestinal disorder it is more than probable that the preceding intestinal disorder resulted from saprophytic germs taken into the body simultaneously with typhoid germs. The effects of the saprophytic germs were shown almost immediately and manifested themselves in some intestinal disorder, while the effects of the typhoid germs did not appear until later.

(3) We are inclined to the opinion that in these cases the difference in time between the appearance of the intestinal disorder and the development of the subsequent typhoid fever represents the period of incubation of the latter disease. If this supposition be true, the period of incubation varies from two days to three weeks.

(4) The intestinal disorders of May and June very infrequently had any relation to typhoid fever.

(5) The intestinal disorders of July and August frequently gave temporary immunity against typhoid fever.

(6) Typhoid fever was, in a large proportion of the cases of that disease, due to a mixed infection. It is probable that in many of the cases in which this mixed infection occurred the diarrhea, induced by the saprophytic micro-organisms, so thoroughly removed the specific germs of typhoid fever that the individual did not develop the latter disease and did acquire, for the time being at least, a certain degree of immunity to typhoid fever.

(7) We certainly are justified in concluding that the intestinal disorders among these troops did not predispose the individuals affected by them to typhoid fever.

INTRODUCTION.

This camp site, which was selected as a rendezvous for the Second Army Corps, commanded by Maj. Gen. W. H. Graham, U. S. Volunteers, is located $7\frac{1}{4}$ miles west of Washington, D. C., and about $6\frac{1}{2}$ miles south of the Potomac River.

TOPOGRAPHY.

We have been unable to procure a detailed topographical map of the site of Camp Alger. We have been informed by Lieut. Col. James L. Lusk, U. S. Volunteers, chief engineer, Second Army Corps, that preparations for a map of this kind were well advanced, but that the want of time and the press of other duties prevented its completion.

The point occupied as headquarters is elevated 408 feet above the Potomac River and was the highest point in the camp site. The average elevation of the regimental camp sites above the Potomac River was about 300 feet.

The general surface of the camp site is decidedly undulating, being well provided with open spaces for regimental or brigade encampment and interspersed with native forests.

By consulting the map of this camp site it will be seen that it is traversed by a few small brooks and provided with a number of shallow springs.

GEOLOGICAL FORMATION AND WATER SUPPLY.

We are indebted to Lieutenant-Colonel Lusk, U. S. Volunteers, for valuable information concerning this camp site, and from whose letter we quote the following:

The layer of soil is quite thin and is underlaid by a stratum of very impervious clay. * * * This stratum of clay appears to extend well down toward the rock, being generally separated from the latter by a layer of fine sand, generally called quicksand by the drillers. With a few exceptions this rock of the gneiss family is covered by a layer of so-called "rotten rock," which grew harder downward.

Although at first the shallow springs, already referred to, and neighboring farm wells were depended upon as a source of water supply, it was soon clearly seen that other means would have to be provided to meet the urgent demands for a better and purer supply of water. An attempt had been made to anticipate this want on the part of a few regiments by ordinary dug wells located in their own regimental camps.

As there were no bathing facilities, the men, in most instances, were marched to the small branches of Accotink Creek, several miles away, or to the Potomac River, still more distant.

On May 25, 1898, the first troops having arrived on May 18, an artesian well was completed in the neighborhood of the camp of the Sixth Massachusetts and the Eighth Ohio regiments. This well supplying a fair yield of soft, clear, and palatable water, the pressure for others of the kind in different parts of the camp became very great.

A board appointed by the War Department reported on June 2, 1898, in favor of other artesian wells for each regiment, or a series of wells from which the water could be pumped to the regimental camps. The first of these plans was adopted, and we are informed that about June 5 additional drilling machines were sent to the camp by the Quartermaster's Department, and that the sinking of the wells was ordered to be

prosecuted as rapidly as possible until there should be one for each regiment. This work was under the immediate supervision of the chief engineer of the Second Army Corps. By reference to the map of this camp site the date on which these wells were completed, as well as their depth and height above the Potomac River, may be ascertained.

We here again quote from Lieutenant-Colonel Lusk's letter:

During the formative period of the camp the regiments arrived in rapid succession, before any corps headquarters had been established or corps staff organized. Many thousand men were thus got into camp grounds of insufficient area, with no water supply except from a few ordinary dug wells, springs, and small streams. The streams became at once polluted and unfit for use. The few wells and springs affording an insufficient supply, even for drinking and cooking, relief was sought by digging shallow wells or sinking driven wells of small depths, using small pipe, both classes of wells being sunk in the regimental camps, or by excavating holes in wet ground and forming so-called springs. The relief thus obtained was precarious so far as concerns quantity, as the water was sure to fail upon the advent of dry weather.

We may state that this demand for a better water supply was not fully met, notwithstanding the most energetic action on the part of the chief engineer officer, until about the end of June.

GENERAL LOCATION OF REGIMENTAL CAMP SITES.

These were, as a general rule, well selected and had good natural drainage, being situated on knolls mostly cleared, but sometimes on wooded hillsides. In a number of instances, however, they were unnecessarily limited in area.

Lieut. Col. Charles Smart, deputy surgeon-general, U. S. Army, having completed an inspection of Camp Alger, Va., states, under date of July 13, 1898, at which time a number of the regiments had already occupied their camp sites for nearly two months, as follows:

The striking characteristics of the camps of the First Division were overcrowding of tents on the camp site, overcrowding of men in the tents, dust, sun glare, and fetid odors. The Eighth, Twelfth, and Thirteenth Pennsylvania were packed closely together, with scarcely an interval between the regiments, the company streets hardly wider than the intervals between adjacent companies should have been, tents of the same companies in contact with each other on the sides, and of adjacent companies in contact by the ends.

These regiments constituted the Third Brigade of the First Division, and probably presented the worst overcrowding to be found among any of the brigades encamped at Camp Alger. The condition of affairs in the First Brigade, First Division, was only slightly better, except that the Sixty-fifth New York Volunteer Infantry, belonging to this brigade, had more space.

According to Lieutenant-Colonel Smart, the regimental camps of the Second Division were generally more expanded than those of the First Division.

DISPOSITION OF GARBAGE AND EXCRETA.

Garbage was deposited in open pits near the company kitchen, and sinks were placed at varying distances beyond the garbage cesspools.

Referring to the regiments of the First Division, Lieutenant-Colonel Smart again says:

The kitchens were close up against the company tents, with uncovered cesspools for kitchen slops and garbage, and the sinks were also so close that, although some care was given to covering the deposits with earth, the sink odor pervaded the company streets.

We may state that during the months of June and July this condition of cesspools and sinks was common to all of the organizations brought together at this camp site. Their contents were left much of the time uncovered, even during the dry weather prevailing in June, and their condition was rendered still more intolerable after the advent of wet weather, since, owing to the high level of the ground water, the contents of the sinks floated to the surface and could not be covered without filling in the pits.

TENTAGE.

At the time of our inspection of Camp Alger, Va., beginning August 20, 1898, the several regiments constituting the First Division of the Second Army Corps, together with the three other regiments belonging to a separate brigade, were well supplied with all necessary tents, but the latter were unprovided with any flooring. This condition as to sufficient tentage did not characterize the earlier days of Camp Alger, since, according to the best available testimony, some of the regiments arrived with too little tentage for their full strength, and hence the men were for a time too much crowded in the tents.

RAINFALL AND TEMPERATURE.

Before taking up the medical history of individual regiments, especially the occurrence of typhoid fever in these, we may state that very dry weather prevailed during the latter part of May and the month of June, and that it was not until about the 20th of July that the first heavy rainfall occurred at Camp Alger. This amounted to 1.1 inches. On the 28th day of June there was a fall of rain amounting to 0.7 of an inch. During the latter part of July and until the middle of August there were repeated heavy rainfalls, but the weather was dry during the last half of August and the first half of the month of September, at which time the camp was abandoned.

As regards the temperature, the weather was extremely hot, and this condition prevailed practically during the whole encampment. (See Meteorological Chart, Camp Alger.)

TYPHOID FEVER IN THE FIRST DIVISION, SECOND ARMY CORPS.

SIXTY-FIFTH NEW YORK VOLUNTEER INFANTRY.

First Brigade, First Division, Second Army Corps.

[Abstract of surgeon's statement—Maj. Albert H. Briggs, U. S. Volunteers.]

The Sixty-fifth New York Infantry was assembled at Camp Black, Hempstead, N. Y., and remained encamped at that point from May 2 to May 19, 1898. During this time the weather was cold and there was considerable rain. All suffered from the exposure. The principal diseases were referable to the lungs—coughs, acute bronchitis, tonsillitis, etc.—with some diarrheal troubles. No case of typhoid fever occurred at this camp.

The regiment left Camp Black, Long Island, on May 19, and arrived at Camp Alger, Va., on the following day. It was placed in camp near the "Brick House," occupying ground which was fairly well drained. On arrival at Camp Alger the weather was very warm, and this great change in temperature was doubtless the cause of considerable diarrhea. The health of the men during May was nevertheless remarkably good, considering the marked climatic changes to which they were subjected.

The water supply at this camp was very limited, both officers and men suffering from lack of water. It was obtained from a so-called spring, which was in reality only a ditch. At the end of the first week holes were dug near the ditch to a depth of about 5 feet and barrels sunk in these. In this way a larger supply of water, objectionable in character, was obtained, although this was far from being sufficient. This water was used without filtration or boiling. The camp was well policed and the sinks well cared for.

One case of typhoid fever appeared in this camp—Private Adam Kuster, Company M, Sixty-fifth New York, who was admitted on May 21 and transferred to the general hospital at Fort Myer on May 25.

The regiment remained at this first camp site till June 7, a period of seventeen days, when it was removed to a more elevated, better drained, and somewhat shaded location near the Seventh Ohio Infantry. The water supply in this camp was obtained from a deep well, which furnished an abundance of clear, cold, odorless water. This well, however, was so placed as to receive in its vicinity the drainage of the First Brigade. No other regiment used this water. The men were quartered in Sibley wall tents, sixteen men to a tent. No flooring was used, but all slept on the ground. This camp was well policed, and the sinks for the reception of fecal matter were on lower ground and well looked after.

Twenty-four cases of typhoid fever occurred in this second camp during the period from June 7 to August 8, 1898. Twenty-one of these cases were confined to the First Battalion, and 17 of these occurred in one

company, Company E. No case of typhoid fever appeared in this camp until about five weeks had passed. The first case (second in regiment) occurred in Company B on July 6. Cases of typhoid fever occurred thereafter in Company E as follows:

Date.	Number of cases.
July 10.....	1
11.....	1
15.....	2
16.....	1
17.....	1
18.....	1
20.....	3
22.....	1
25.....	2
26.....	1
29.....	1
Aug. 1.....	1
3.....	1
Total.....	17

The regimental surgeon has been unable, even after patient investigation, to ascertain the origin of this outbreak of typhoid fever in Company E. All of the men of the regiment were placed under the same sanitary conditions as to food, water supply, and location, except that Company E occupied next to the lowest ground in the camp, being placed between Companies L and M.

The men of this company were from Jamestown, N. Y., and were all men of means who had money to spend and hence purchased more articles of food and drink from surrounding "shacks" and venders than any other company in the regiment. This company also received more boxes from home than the other companies. Company E used about 3 gallons of milk daily, principally for cooking purposes. This milk was obtained from a milkman who lived about 7 miles away. Major Briggs investigated the health of the milkman's family as well as that of several other families from which he obtained a part of his milk supply, but found no cases of typhoid fever. Halfway to camp from the milkman's house there was a pump by the road, and the family living there had cases of typhoid fever. This he considered as offering a possible explanation of the outbreak of the disease in Company E. The same milk supply was, however, used by Companies L and M, and no cases of fever had occurred in either of these. Another possible explanation was that Company E had cesspools in its company street—one cesspool to two tents, intended for the reception of waste water. These cesspools had been used for about three weeks, when they had become so foul and offensive as to necessitate their closure. A third possible explanation was the arrival at Camp Alger on July 3 of three cars containing thirty-eight wagonloads of food stuffs. These cars were sent by the Buffalo Evening News, and contained food of various kinds, such as boiled hams, fowls, canned stuffs, cakes, pastries, etc. The following morning 154 men presented themselves at surgeon's call, all suffering with diarrhea. Company E lived riotously for a few days. Typhoid fever appeared about two weeks later.

The regiment had moved into its present and third camp since reaching Camp Alger on August 8, 1898. This site was suitable in all respects, elevated, well drained, and exposed to the sunlight. Water supply was hauled in barrels from springs at much inconvenience. Sinks were kept in good condition, each man being required to cover his stool at once with dry earth.

Typhoid fever has continued to occur in this encampment. Up to this date (August 21) there have been a total of 46 cases; Companies E and F having had 19 and 8 cases, respectively. Only a few cases have occurred in the other companies of the regiment. Companies I and K have had no cases.

REMARKS BY THE BOARD.

An examination of the regimental reports of sick and wounded of the Sixty-fifth New York Infantry shows that for the month of May, 1898, the mean strength of the regiment was, officers, 50; enlisted men, 980; total, 1,030.

There were 94 admissions to sick report, of which—

Acute catarrhal affections of the respiratory tract contributed.	15
Acute diarrhea	26
Typhoid fever	1
Undetermined fever	1
All other diseases	51

There were no malarial fevers reported.

The diarrheas were of short duration, as a rule lasting from twenty-four to forty-eight hours.

The case of undetermined fever was returned to duty at the end of two days.

The case of typhoid fever, Private G. Kerslake, Company H, was admitted on May 18 and transferred to the field hospital, Camp Black, May 19, 1898.

It is not possible to determine from the regimental returns whether sickness was markedly increased at Camp Alger, Va., during the last ten days of May, since the report of sick practically begins with the arrival of the regiment at that camp.

We note the admission to sick report on May 25 of Private L. T., Company L, Sixty-fifth New York Infantry, with the diagnosis of acute gastroenteritis. He was transferred to the Fort Myer General Hospital May 27, where later symptoms of meningitis developed, leading to a fatal result on June 6. This case should be regarded with suspicion.

For the month of June, in an average strength of 1,103 officers and enlisted men, there were 377 admissions, as follows:

Acute diarrhea	91
Acute dysentery	23
Intermittent fever	15
Remittent fever	4
Undetermined fever	23
Typhoid fever	0
All other causes, chiefly vaccination	221

The cases of diarrhea and dysentery were mild in character, only 4 cases lasting more than five days. Of the 6 cases transferred to division hospital 5 were sent to duty within three days, while the diagnosis in 1 case was changed to remittent fever, the duration of the disease being sixteen days. The case dated from June 17.

Of the 15 cases diagnosed as intermittent fever 9 were treated in quarters and were of the following duration: Two to four days, 5; five days, 2; six days, 1; eight days, 1. Six were transferred to division hospital; 5 of these were returned to duty within three days, and 1 was changed to the diagnosis of typhoid fever.

The cases of remittent fever were of less than seven days' duration.

Only 2 of the cases of undetermined fever were more than six days in duration. Private C. F. M., Company M, Sixty-fifth New York, admitted June 29 as "fever undetermined," was transferred to hospital on July 7, where the diagnosis was changed to subacute enteritis, the case being returned to duty July 14, and again admitted July 21 as chronic diarrhea, and again sent to duty on July 30.

Private C. W. B., Company B, admitted June 24 as "fever undetermined," was sent to duty June 30, but readmitted July 7 as suspected typhoid and transferred to First Division Hospital on July 13, where the diagnosis was changed to typhoid fever.

It thus appears that 2 cases of typhoid fever occurred in this regiment during the month of June, viz, Company A, 1 case, changed from intermittent fever, June 15; Company B, 1 case, changed from fever undetermined, June 24; and that there were 2 other cases of possible typhoid fever, viz, Company K, June 17, 1 case, diagnosed as diarrhea and intermittent fever, lasting sixteen days; and Company M, June 29, 1 case, diagnosed as undetermined fever, subacute enteritis, and chronic diarrhea, lasting thirty-one days.

In an average strength for July of 1,326 officers and men, there were 301 admissions for all causes, as follows:

Acute diarrhea	94
Febricula	3
Intermittent fever	8
Fever undetermined	17
Typhoid fever	18
All other causes	161

The cases of diarrhea were, as a rule, short in duration, 80 being returned to duty in less than three days and all to duty within nine days.

Seven cases diagnosed as intermittent fever were returned to duty within five days; 1 was transferred to division hospital and changed to typhoid fever.

Of the 17 cases of undetermined fever, 12 were treated in quarters and were less than four days in duration; 5 were transferred to First Division Hospital, where 3

seen that the disease continued to steadily increase in the old camp, there being 26 cases recorded for the first eight days of the month, and that, notwithstanding the removal of the regiment on August 8, there was no apparent reduction of cases ten days or two weeks later, as might have been anticipated; and this in spite of strenuous efforts to maintain the camp in the best sanitary condition.

It will also be seen that the disease was very unequally distributed among the several companies of the regiment; that while certain companies, such as F, C, B, A, and L, had a large percentage of men affected, other companies had but few cases.

Water at this time was obtained from various springs, but was distributed alike, so that the source or sources of infection should be sought elsewhere than in the water supply. In the crowded condition in which the men of this regiment were living—16 men to each Sibley wall tent—infected articles of bedding and clothing probably had much to do with the propagation of the disease, while a certain number of cases were infected from sources outside of the camp.

The regiment left Camp Alger, Va., September 4 and arrived at Buffalo, N. Y., September 5. Officers were granted leave of absence and men furloughed for thirty days, with orders to reassemble at the State arsenal, Buffalo, N. Y., on October 6, 1898.

STRENGTH FOR SEPTEMBER.

Officers	48
Enlisted men	1,270
Admissions:	
Acute diarrhea	8
Continued fever	4
Intermittent fever	2
Remittent fever	1
Typhoid fever	11
All other causes	12
Total	38

The cases of diarrhea were of short duration.

One case of continued fever lasted four days. The other 3 cases of this disease, as well as the 3 cases of malarial fever, could not be further traced.

The report for September only embraces the period September 1 to 3. Nine of the cases of typhoid fever reported were admitted on September 1, and 2 cases on the 3d. For the remainder of September it is not possible to give the dates of occurrence of cases of this disease.

That many additional men were already infected prior to leaving Camp Alger, Va., is shown by the October report of sick and wounded, which begins with October 6, the day on which the men reassembled at Buffalo, N. Y., after thirty days' furlough. On the latter date all cases occurring between September 5 and October 6 were taken up on sick report. Among these we find 48 cases of typhoid fever, which, with the 9 cases admitted between September 1 and 3, would give 57 cases

of typhoid fever for September, distributed by companies as follows:

Company A, 7 cases; Company B, 7 cases; Company C, 9 cases; Company D, 3 cases; Company E, 3 cases; Company F, 6 cases; Company G, 3 cases; Company I, 5 cases; Company K, 8 cases; Company L, 3 cases; Company M, 2 cases; band, 1 case; total 57 cases.

The regiment was mustered out of service November 19, 1898. No cases of typhoid fever were recorded for this month.

SUMMARY.

Assembled at Camp Black, Hempstead, N. Y., remaining encamped from May 2 to 19, 1898.

Arrived at Camp Alger, Va., May 20, 1898.

Had one case of recognized typhoid fever at State encampment.

Imported one case of recognized typhoid fever.

Date of first case of recognized typhoid fever after arrival at Camp Alger, June 15, 1898.

Typhoid fever in the Sixty-fifth New York Volunteer Infantry, by months.

	May.	June.	July.	August.	September.	Total.
Recognized cases.....	2	2	24	127	57	212
Probable cases.....		2		5		7
Total	2	4	24	132	57	219

The cases of recognized typhoid fever (212) were diagnosed as follows:

Typhoid fever.....	152
Intermittent fever	2
Undetermined fever	4
Acute gastritis.....	1
Typhoid suspect.....	17
Intermittent, remittent, continued, or undetermined fever ...	36

The cases of probable typhoid fever (7) were diagnosed as follows:

Diarrhea and remittent fever	1
Undetermined fever, subacute enteritis, and chronic diarrhea	1
Malarial fever.....	1
Continued fever	1
Undetermined fever	1
Typhoid suspect	2
Total cases of recognized and probable typhoid fever.....	219
Number of deaths from recognized typhoid fever.....	14
Per cent of mortality among recognized typhoid-fever cases ..	6.60
Per cent of mortality among recognized and probable typhoid-fever cases	6.39

Left Camp Alger, Va., September 4, 1898.

Arrived at Buffalo, N. Y., September 5, 1898, and furloughed thirty days, with orders to reassemble October 6, 1898, at State arsenal, Buffalo, N. Y.

SEVENTH OHIO VOLUNTEER INFANTRY.

First Brigade, First Division, Second Army Corps.

[Abstract of surgeon's statement—Maj. D. A. Rainels, U. S. Volunteers.]

The Seventh Ohio Infantry was mustered into service May 14, 1898, at Columbus, Ohio, and remained there till May 19, 1898.

The regiment arrived at Camp Alger, Va., on May

21, and went into camp near the "Brick House." Prior to leaving Columbus a member of Company D was sent to one of the city hospitals, on May 16, with the diagnosis of typhoid fever. This case was afterwards reported as a case of meningitis. The day following the arrival of the regiment at Camp Alger, Private B., Company M., was transferred to the hospital at Fort Myer, Va., as a case of typhoid fever. He had been sick only two days.

On June 7 the regiment changed its camp to the high ground next to the site occupied by the Sixty-fifth New York Infantry. The same day Private J. C. W., Company D., was sent to the division hospital, and died on June 13 of typhoid fever. This soldier had been on pass in the city during the first week of the Camp Alger encampment. About the middle of June the regiment went on a practice march up the Potomac River. July 1 one of the field officers was taken sick with what seemed to be a malarial attack, with some diarrhea. July 3 he availed himself of sick leave and went to his home, where he died July 15 of typhoid fever. July 8 Company C, recruited on the second call for volunteers, arrived from Gallipolis, Ohio. This company brought one case of typhoid fever, which was transferred to hospital July 9. July 19 one of the officers of this company left on leave and developed typhoid fever soon after reaching home. Both of these are believed to have been contracted prior to the arrival of the company at Camp Alger. A few more cases of typhoid fever occurred during the month of July; otherwise the health of the men was very good.

The regiment moved into its third camp at Camp Alger on July 25. This was an elevated site, well drained, and very desirable. In this camp also water was obtained from a bored well, which also furnished water to the First New Jersey Infantry. A few sporadic cases of typhoid fever have developed in this camp. As to the origin of this disease at Camp Alger the regimental surgeon has no explanation to offer.

REMARKS BY THE BOARD.

Concerning the May report of sick and wounded, the surgeon states that measles and diarrhea have been the prevailing complaints, and that the water supply for both drinking and cooking purposes was insufficient.

In an average strength of 818 officers and men there were only 21 admissions from May 14 to 31, as follows:

Acute diarrhea	7
Intermittent fever	2
Typhoid fever	2
Other causes, chiefly measles	10

The diarrheas were of less than forty-eight hours' duration.

The cases of intermittent fever lasted two and seven days, respectively.

The first case of typhoid fever occurred on May 14, in Company D, and was transferred to one of the hos-

pitals in Columbus, Ohio, on May 16. The second case occurred in Company M on May 21, and was transferred to Fort Myer the following day. So that, although the health of the men was very good for May, this regiment imported at least one case of typhoid fever into its camp in Virginia.

The surgeon states that 410 recruits were received during June and distributed equally among the eleven companies; that while the older soldiers remained almost free from bowel complaints the recruits had a good deal of diarrhea.

Strength for June	1,221
Admissions:	
Acute diarrhea	44
Intermittent fever	7
Typhoid fever	0
Typhoid suspect	1
Measles	12
All other causes	60
Total	124

Forty cases of diarrhea were treated in quarters and were returned to duty within three days. Four cases were sent to division hospital and returned to duty within four days.

The cases diagnosed as intermittent fever were of short duration. Of the 2 cases transferred to hospital, 1 was returned to duty after three days and 1 could not be traced.

The case diagnosed as typhoid suspect, Private C. S., Company A, was admitted June 14 as acute diarrhea, returned to duty June 15, readmitted as typhoid fever June 18, and transferred to division hospital June 19, where all further record is lost.

The regiment moved into its second camp on June 7, near that of the Sixty-fifth New York Infantry, and about the middle of June went on a practice march to the Potomac River and return.

Average strength for July, 1,313 officers and men. Admissions, 194, divided as follows:

Diarrhea	15
Intermittent fever	16
Remittent fever	1
Typhoid fever	2
Typhoid suspects	7
Measles	13
All other causes	140

The cases of diarrhea were of short duration, only 1 case lasting eight days.

The cases of intermittent fever were treated in quarters, none of which were of more than three days' duration. Six cases were sent to division hospital, of which 5 were returned to the regiment within four days and 1 changed to typhoid fever.

The case of remittent fever was changed to the diagnosis of measles in the division hospital.

Of the 7 cases diagnosed as typhoid suspects, 3 were returned to duty within three days, and in 4 cases the

diagnosis of typhoid fever was confirmed at the Fort Myer General Hospital.

We also find that Private W., Company D, admitted to division hospital June 18 with gonorrhea, was transferred to the general hospital at Fort Myer on July 9 as a case of typhoid fever, death occurring on July 13. The date of the commencement of the attack in this case can not be fixed. This is the case reported by the surgeon as admitted on June 7, with fatal termination June 13.

Thus, for the month of July, we find that 11 cases of typhoid fever have occurred in this regiment, as follows:

Date.	Company.								Field officer.	Total.
	A.	C.	D.	F.	G.	K.	L.	M.		
July 1.....	1								1	2
8.....		1						1		2
9.....	1		1							2
16.....							1			1
17.....							1			1
25.....					1					1
30.....				1		1				2
Total ..	2	1	1	1	1	1	2	1	1	11

To these should be added the case of an officer of Company C, who arrived with his company on July 8 and left on sick leave July 19; disease, typhoid fever. This case, mentioned in the surgeon's statement, does not appear on any of the records.

On July 25 the regiment moved to a new camp site near Dunn Loring, Va.

Concerning the report of sick and wounded for August, the surgeon remarks that the character of the malarial disease seemed to change from an intermittent to that of a remittent type, and that typhoid fever had markedly increased, notwithstanding all precautions taken against its spread.

SUMMARY FOR AUGUST.

Average strength.....	1,284
Admissions:	
Diarrhea	19
Dysentery	2
Intermittent fever.....	48
Remittent fever.....	15
Undetermined fever.....	28
Typhoid fever	20
All other causes.....	114
Total.....	246

Of the 21 intestinal cases, 19 were treated in quarters and returned to duty within five days; 2 were transferred to hospital, of which 1 was changed to typhoid fever and 1 furloughed after four days without diagnosis.

Eighteen cases of intermittent fever were treated in quarters and returned to duty after periods varying from one to eight days. Thirty cases were sent to division hospital; of these, 2 were changed to remittent fever and returned to duty within four days; 4 were furloughed as remittent fever at periods varying

from four to twelve days; 2 were furloughed as diarrhea; 1 changed to diagnosis of bubo; 1 to intercostal neuralgia; 15 to diagnosis of typhoid fever, and 5 could not be traced.

Of the cases of remittent fever, 12 were treated in quarters and returned to duty within one to nine days; 3 were sent to hospital, of which 1 was furloughed as continued fever, and 2 changed to the diagnosis of typhoid fever.

The cases of undetermined fever were transferred to hospital and disposed of as follows: Four cases returned to duty after four to eleven days as remittent fever; 2 furloughed as remittent fever after twenty-four hours' treatment; 1 changed to the diagnosis of gastric catarrh; 1 to acute bronchitis; 8 to the diagnosis of typhoid fever, and 12 cases could not be traced.

In addition, 4 cases of typhoid fever were found in the First Division Hospital whose names had been omitted from the regimental sick report for August, thus bringing the total number of recognized cases of typhoid fever for this month to 50, instead of 20 as reported by the surgeon. (See chart of the Seventh Ohio Infantry.)

We observe that following the change of camp site on July 25 typhoid fever made but slight progress, only 11 cases of the disease having occurred up to August 16, but from that time cases increase in number, so that 41 cases are recorded for the last half of August. We also observe that 12 cases, or nearly one-third, occurred in one company (M). Seven occurred in Company F. With these exceptions, no other company had more than 5 cases, and four companies only 2 cases each. As the water supply, obtained from a deep well, was common to all of the companies, this can be excluded as a common source of infection.

The regiment left Camp Alger on September 1, going direct to Columbus, Ohio, where it was encamped until September 27.

No strength is given for the month of September. The surgeon reports as follows:

Intestinal disorders (all short)	10
Intermittents (10 of which were short and 10 transferred to hospital)	20
Cases of remittent fever (16 of which lasted less than five days and 34 transferred to hospital).....	50
Cases of typhoid fever	11

We have been able to find 22 cases of typhoid fever among the supposed malarial cases sent to division hospital and St. Francis Hospital, Columbus, Ohio, thus making 33 cases of this disease for the month of September. We do not think, however, that this number expresses the full prevalence of the disease during September, as nearly one-half of the hospital cases could not be traced.

On September 27 the men were granted verbal furlough for thirty days, the companies reassembling October 26.

The surgeon remarks on the October report of sick and wounded that "Many of the men were taken sick after reaching home; most of these recovered sufficiently to report at the end of the furlough, while others developed typhoid fever." He further reports that for the month of October it was not possible to keep a correct account of the sick, as the men were quartered in different parts of the city of Columbus. He reports 21 cases of typhoid fever as "admitted from verbal furlough" for October. These cases, together with the 4 other cases traced by the board, are not included in the cases charted for the Seventh Ohio, as correct dates for admission could not be found.

The regiment was mustered out of service on November 6, 1898.

SUMMARY.

Mustered into service May 14, 1898, at Columbus, Ohio.

Arrived at Camp Alger, Va., May 21, 1898.

Had 1 case of recognized typhoid fever at State encampment.

Imported 1 case of recognized typhoid fever.

Company C, arriving July 8, imported 2 cases of recognized typhoid fever.

Date of first case of recognized typhoid fever after arrival at Camp Alger, Va., June 14, 1898.

Typhoid fever in the Seventh Ohio Volunteer Infantry, by months.

Left Camp Alger, Va., September 1, going direct to Columbus, Ohio.

Furloughed on September 27 for thirty days.

Reassembled October 26, 1898.

FIRST NEW JERSEY VOLUNTEER INFANTRY.

First Brigade, First Division, Second Army Corps.

[Abstract of surgeon's statement—Maj. Henry Allers, U. S. Volunteers.]

The regiment was mustered in at Seagirt, N. J., from May 7 to May 12, 1898, and remained at that point till about May 20, when it left for Camp Alger, Va., arriving on May 21. No case of typhoid fever had developed at the State camp ground, and no case occurred at its first camp site at Camp Alger.

About the beginning of the second week in June the regiment was placed in a second camp, located in the pines, adjacent to that of the Seventh Ohio Infantry, on ground which had been occupied by the Fourth Mis-

souri Infantry. Typhoid fever appeared in this second camp, its origin being attributed by Major Allers to previous infection of the soil by the Fourth Missouri Infantry. There was not sufficient room at this site to allow proper space between the tents. Water was obtained from brooks and was insufficient in quantity. The regiment was supplied with A wall tents, four men occupying a tent. The men were guarded very strictly in the matter of visiting "shacks" and purchasing from irresponsible venders. The general good health of the men was attributed to this fact. The first case of typhoid fever occurred on July 4 in this camp, and has been followed by a number of cases both in July and August. To the present time (August 23) there have been about 40 cases with 3 deaths. Company M has had more cases than the other companies.

The regiment moved to its third camp site at Camp Alger early in August. This camp was unobjectionable, both as to position and drainage. Water was obtained from a driven well. There has been some diminution in the cases of typhoid fever in this camp, although the disease still continues.

REMARKS BY THE BOARD.

Average strength for May, 1,030 officers and men; admissions to sick report, 129, as follows:

Intestinal diseases.....	38
Malarial, intermittent	6
Bronchial diseases.....	23
Typhoid fever.....	0
All other causes.....	62

Diarrheal diseases were mild in character, all cases being returned to duty within two days except 2 cases, transferred to First Division Hospital, which could not be traced.

No malarial cases lasted longer than forty-eight hours.

During the month of June, in an average strength of 1,334 officers and men, there were 129 admissions to sick report, divided as follows:

Intestinal diseases.....	53
Intermittent fever.....	11
Continued fever.....	1
Typhoid fever.....	0
All other causes.....	64

No case of diarrhea was under treatment longer than seven days. Cases diagnosed as intermittent fever were of short duration. The case diagnosed as continued fever went to duty at the end of twenty-four hours. Thus the health of the regiment up to the end of June was good.

The regiment retained its camp site in July. During this month, in an average strength of 1,330 officers and men, there were 142 admissions to sick report, as follows:

Intestinal diseases.....	53
Malarial fever.....	20
Continued fever.....	2
Typhoid fever.....	3
Typhoid suspects.....	2
Other diseases and injuries.....	62

Of the cases of intestinal disorder 51 were treated in quarters and returned to duty within four days; 2 cases were transferred to division hospital, of which 1 was returned to duty after twenty-five days, diagnosis changed to chronic dyspepsia, and 1 was changed to the diagnosis of typhoid fever.

Fifteen cases diagnosed as malarial fever were treated in quarters, of which 10 were returned to duty within two days, 2 after three days, 2 after six days, and 1 case (an officer) reported "absent, sick" was changed to typhoid fever. Of the 5 cases transferred to division hospital, 3 returned to duty within five days, diagnosis unchanged; 1 was changed to bronchitis, and to duty after twelve days, and 1 to acute enteritis. The latter could not be further traced.

Of the 2 cases diagnosed as continued fever, 1 was admitted July 2 as acute diarrhea, was returned to duty July 3, readmitted to sick report July 4 as continued fever, and transferred to division hospital the same day, where the diagnosis was changed to typhoid fever. The other case was transferred to the general hospital at Fort Myer July 6, where the diagnosis was changed to "pneumonia, complicating typhoid fever," the patient dying on the 12th of July.

The diagnosis in the 2 cases of typhoid suspects was afterwards confirmed. We thus find the following cases of typhoid fever, 9 in number, in this regiment during July, viz:

Date.	Com- pany.	Number of cases.
July 2	G	1
4	K	1
4	L	1
23	M	1
25	A	1
28	B	1
28	D	1
31	E	1
31	L	1
Total		9

We further observe that the first case did not appear until about six weeks after the arrival of the regiment at Camp Alger and about three weeks after its occupancy of the ground vacated by the Fourth Missouri Infantry. The occurrence of the cases as above given would seem to exclude the theory entertained by Major Allers of previous soil infection. Besides, our investigation will show that no case of typhoid fever had appeared in the Fourth Missouri Infantry while occupying this site. We observe that 4 companies of the First New Jersey Infantry have as yet had no cases of the disease.

During the first week in August this regiment moved into its third camp site at Camp Alger, occupying elevated ground near the site of the Seventh Ohio Infantry.

SUMMARY FOR AUGUST.

Average strength	1,366
Admissions:	
Intestinal diseases	20
Intermittent fever	59
Typhoid fever	11
Not diagnosed	1
All other causes	72
Total	163

Seventeen intestinal cases were treated in quarters, and were of the following duration: One to three days, 15; five to seven days, 2. Three cases were sent to hospital. Of these 1 was returned to duty after fourteen days, diagnosis unchanged; 1 was changed to typhoid fever, and 1 could not be traced.

Thirty-three cases of intermittent fever treated in quarters were returned to duty as follows: One to three days, 26; four to six days, 7. Twenty-six cases were sent to hospital with the following result: Two changed to the diagnosis of constipation and returned to duty after two to thirteen days; 3 changed to remittent fever and to duty after fourteen to nineteen days; 2 to intermittent fever and to duty after four days; 2 furloughed as remittent after seven to thirteen days, and 1 as intermittent after three days; 1 furloughed after six days without diagnosis; 4 changed to the diagnosis of typhoid fever, and 11 of which no record can be found.

The case not diagnosed by the surgeon was changed to typhoid fever in the division hospital. We have also found another case of typhoid fever under treatment in the First Division Hospital not accounted for by the surgeon, thus making a total of 18 cases for the month of August.

The First New Jersey Volunteer Infantry left Camp Alger on September 2 for Camp Voorhees, Seagirt, N. J.

In an average strength of 1,326 for this month, 54 admissions to sick report are reported as follows:

Intermittent fever	20
Intestinal diseases	3
Typhoid fever	5
All other causes	26

Three malarial cases were returned to duty within four days, the remaining 17 cases being furloughed after periods varying from one to fourteen days. No further record could be obtained in these cases except in one instance—a private of Company D, who died of typhoid fever at his home on October 18.

The intestinal disorders were furloughed. One of these also died of typhoid fever at his home October 17. The surgeon reports the death of a member of Company D, which occurred at his home on September 16, but does not give the date of his admission to sick report.

Only eight cases of typhoid fever are therefore re-

ported for September. Whether this represents the total cases for this month can not be stated. It probably, however, falls below the actual number, but concerning this point we have been unable to obtain accurate information. As bearing upon the number of cases, we have been able to find 8 deaths in this regiment due to typhoid fever in a total of 35 cases recorded. This would indicate either an unusually high mortality or a larger number of cases than we have been able to trace, probably double the number recorded. However this may be, the health report of this regiment during the Alger encampment must be regarded as remarkably good, both as to the small number of intestinal and malarial diseases that occurred, as well as for the comparatively small number of cases of typhoid fever. No case of remittent fever is recorded for the entire encampment, even for the month of August.

The regiment was mustered out of service on November 4, 1898.

SUMMARY.

Mustered into service at Seagirt, N. J., May 7 to 12, 1898.
Arrived at Camp Alger, Va., May 21, 1898.
Had no typhoid fever at State encampment.
Did not import typhoid fever into Virginia camp.
Date of first case of recognized typhoid fever after arrival at Camp Alger, July 2, 1898.

Typhoid fever in the First New Jersey Volunteer Infantry, by months.

Left Camp Alger September 2, 1898, for Camp Voorhees, Seagirt, N. J.

SIXTH ILLINOIS VOLUNTEER INFANTRY.

Second Brigade, First Division, Second Army Corps.

[Maj. Frank Anthony, surgeon, U. S. Volunteers.]

REMARKS BY THE BOARD.

This regiment was mustered into service at Camp Tanner, Springfield, Ill., during the early part of May, 1898.

The regiment arrived at Camp Alger, Va., on May 21, 1898.

The surgeon (Maj. Frank Anthony) states that the prevailing diseases at Camp Tanner were pneumonia, cold, and typhoid fever, these being caused by crowding in buildings poorly adapted for such purposes. He

adds that 2,400 men were quartered in a brick building with cement floor, and that the weather was cold and rainy during the greater part of the three weeks while camped here. Prior to its departure from Camp Tanner, Ill., a case of typhoid fever was admitted from Company A on May 15, and transferred to one of the city hospitals, where the soldier died on May 21. Five other cases, diagnosed as "bilious," were sent to city hospitals between May 15 and May 17. The subsequent history of these cases we have not been able to trace.

For the month of May, in a mean strength of 49 officers and 975 enlisted men, there were 43 admissions to sick report, namely:

Diarrhea and biliousness.....	14
Malarial fever.....	6
Typhoid fever.....	3
All other causes.....	20

Of the intestinal cases, 1 was returned to duty at the end of twenty-four hours. The remaining cases, reported as transferred to hospital, could not be traced, nor could the 6 cases diagnosed as malarial fever be found among the admissions to the Second Division Hospital.

Of the 3 cases reported as typhoid fever by the regimental medical officer, 1 has already been referred to as occurring on May 15 at Camp Tanner, Ill. One other, admitted from Company B, on May 30, with diagnosis "bilious, complicated with typhoid malaria," was transferred to Fort Myer, Va., and found to be a case of typhoid fever. The third case reported by the surgeon was changed in general hospital to acute pleurisy. This regiment, therefore, imported typhoid fever into its Virginia camp.

During the month of June, in a mean strength of 48 officers and 1,256 enlisted men, there were recorded 159 admissions to sick report, as follows:

Bilious.....	31
Diarrhea.....	36
Malaria.....	3
Undetermined fever.....	8
Typhoid fever.....	0
All other causes.....	81

The cases diagnosed as malaria or undetermined fever were of short duration; likewise 6 diagnosed as bilious or diarrhea, except in 2 cases of the former, which were changed to the diagnosis of typhoid fever in the division hospital. These cases were admitted on June 20 and June 29, both from Company B.

The regiment, consisting of 50 officers and 1,266 enlisted men, left Camp Alger on July 5 for service in Porto Rico. The surgeon states that the monthly sick report is as nearly complete as could be made with the regiment divided into four sections. Only 21 admissions are recorded, namely:

Bilious.....	13
Malaria.....	4
Typhoid fever.....	3
All others.....	1

One case diagnosed as bilious was returned to duty at the end of seven days. Four cases were transferred to St. Francis Hospital, South Carolina, of which no further record has been obtained. Eight were transferred to the hospital ship *Lampasas*, of which 3 were changed to the diagnosis of typhoid fever and 5 have not been traced.

The cases of typhoid fever reported by the surgeon were confirmed in the hospital.

We thus find 6 cases of typhoid fever for the month of July.

We have been unable to follow the movements of this regiment during the months of August and September while it was still serving in the island of Porto Rico. The strength of the regiment for these two months is not given.

The admissions for August are recorded as 257, as follows:

Malarial fever.....	156
Bilious	58
Undetermined fever.....	11
Typhoid fever.....	3
All other causes.....	29

Of the 69 cases diagnosed as bilious or undetermined fever, we have been able to trace 54, all of which were changed to the diagnosis of typhoid fever. This number, added to the 3 cases reported by the surgeon, brings the total cases for this month to 57. (See chart.)

The admissions for September were 119, divided as follows:

Malarial fever.....	97
Typhoid fever.....	1
All others.....	21

The examination of the hospital records from Porto Rico and the hospital ship *Lampasas* shows that 8 supposed malarial cases were changed to the diagnosis of typhoid fever. Later records of this regiment have not been accessible.

The regiment was mustered out at Springfield, Ill., November 25, 1898.

SUMMARY.

Mustered into service at Springfield, Ill., during the early part of May, 1898.

Arrived at Camp Alger, Va., May 21, 1898.

Had 1 case of typhoid fever at State encampment.

Imported 1 case of typhoid fever into its Virginia camp.

Date of first case of recognized typhoid fever after arrival at Camp Alger, June 20, 1898.

Per cent of mortality among recognized cases of typhoid fever	10.66
Left Camp Alger July 5, 1898, for Porto Rico.	

SIXTH MASSACHUSETTS VOLUNTEER INFANTRY.

Second Brigade, First Division, Second Army Corps.

[Maj. Otis H. Marion, surgeon, U. S. Volunteers.]

REMARKS BY THE BOARD.

This regiment was mustered into service at Framingham, Mass., May 13, 1898.

It arrived at Camp Alger, Va., May 22, 1898, and remained encamped at this point until July 5, 1898, when it left for service on the island of Porto Rico.

No regimental reports for the month of May are available for study.

During June, in an average mean strength of 45 officers and 1,068 enlisted men, there were 391 admissions to sick report, viz:

Diarrhea.....	275
Malarial fever.....	10
Febricula	4
Typhoid fever.....	5
Not diagnosed.....	7
All other causes.....	90

These figures are taken from the regimental report of sick and wounded.

The intestinal disorders were all of short duration, as a rule not lasting more than two or three days, except 2 cases lasting six days each and 1 case fifteen days. A case admitted on June 2 from Company E, with diagnosis acute diarrhea, and transferred to Fort Myer on June 22, was there changed to the diagnosis of typhoid fever.

The cases of febricula were returned to duty within forty-eight hours, and the supposed malarial fevers did not last longer than three days.

Of the cases reported as "not diagnosed," we have been able to trace 3 in the division hospital, where the diagnosis of typhoid fever was given in each instance.

The cases reported as typhoid fever, 5 in number, by the regimental medical officers were confirmed.

Thus we find for the month of June 9 cases of typhoid fever occurring in this regiment. The earliest case, already mentioned, was admitted on June 2 from Company E, and followed by a second and third case, on June 16 and 18, from Companies M and H. This regiment, therefore, probably imported 1 case of typhoid fever into its Virginia camp.

As already stated, the regiment left Camp Alger on July 5, and landed at Guanica, P. R., on July 25, having been quartered on the U. S. S. *Yale* from July 8 to the date of disembarkation above given. The regiment changed camp twice prior to July 31.

In a mean strength of 45 officers and 1,263 enlisted men for July, there were 137 admissions, namely:

Diarrhea.....	7
Fevers.....	2
Febricula	36
Typhoid fever.....	42
Not diagnosed.....	1
All other causes.....	49

The cases of diarrhea were reported as transferred to the field hospital at Guanica, and to hospital ship *Lampasas*. We have been unable to trace these cases further.

The cases reported with diagnosis of fever and febricula were transferred either to the division hospital, Guanica, or to the hospital ship *Seneca*. Of these we have been able to trace 6 cases only, in each of which the diagnosis was changed to typhoid fever.

The case entered as "not diagnosed" was also changed to typhoid fever.

The diagnoses in the 42 cases of typhoid fever reported by the surgeon were confirmed, so that 49 recognized cases of this disease occurred during the month of July. Five were reported prior to the regiment's departure from Camp Alger. Seven other cases may be traced to infection at the Virginia camp.

Thirty-four additional cases were admitted to division hospital on July 26. Although we have been unable to obtain the exact commencement of the disease in these cases, we are confident that they should be ascribed to an earlier date than July 26. From an investigation made by Lieutenant-Colonel Senn, U. S. Volunteers, the conclusion was reached that the majority of these cases were infected prior to the disembarkation of the men on the island of Porto Rico. In other words, the Sixth Massachusetts Infantry imported a large number of cases of typhoid fever into its camp on Porto Rican soil.

During the following months of August and September the disease increased to a certain extent.

The following are the remarks concerning the movements and camp sites, as obtained from the Adjutant General's Office, during August:

August 1, broke camp at Tallaboa at 7.30 a. m., and as part of main body the regiment marched to Ponce, 12 miles, Company L having been left at Yauco as garrison. The sun was hot and the men were exhausted. Marched through Ponce to camp ground, arriving at 4.30 p. m. The camp was located on an old sugar field. Remained in Ponce until August 9. The camp at Ponce was carefully graded and policed. There was a good water supply at some distance. The weather was dry, but showery. Company L joined the regiment from Yauco the evening of August 5. Companies B and D arrived from Guanica August 8. Health of command good.

Broke camp August 9 at 8 a. m. en route for Adjuntas. Arrived at Guaraguaires coffee plantation about 3.30 p. m.; men in good condition.

Broke camp August 10 at Guaraguaires at 1.20 p. m. in a rain storm, and proceeded to coffee plantation at Povenir, about 6 miles distant, when a halt was made, in a driving rain, and part of the regiment was quartered in and under buildings, the rest building fires and sitting about them. Few tents were pitched, as the men's shelter-tent rolls were on ox teams, some of

which did not arrive until next day. The men were very wet, having forded several streams, and it having rained all night.

August 11 part of the bull teams arrived with rolls and supplies, and camp was broken at 1 p. m. and proceeded to Adjuntas, 6 miles distant. There were showers while on the way. Reached Adjuntas about 4 p. m., and camped on a plateau on the top of a hill near the town. Very heavy rains on August 12.

August 13, broke camp at 8 a. m. and marched to Utuado, arriving at 3.15 p. m., with the men in good condition. Camped on a large sugar plantation bordering on the river. Continual rains; ground very wet; many men suffering from dysentery. Company F was left at Adjuntas. Part of the company joined the regiment on August 19; the remainder, August 20.

August 21, fair, with occasional showers; very large sick list; many men suffering from diarrhea; many men without hats, shoes, and other articles of clothing. August 22, fair; ground dry. August 23, fair; ground dry, but smells bad. Sick list on the increase; men suffering from diarrhea.

August 24, fair in the morning. Broke camp at 2.30 p. m. to move into the town of Utuado; slight showers in the afternoon. The regiment was quartered in coffee storehouses and schoolhouses.

In a mean strength for August of 44 officers and 1,226 enlisted men there were 529 admissions to sick report, as follows:

Intestinal disorders.....	440
Fevers.....	10
Febricula.....	47
Typhoid fever.....	1
Not diagnosed.....	8
All other causes.....	23

These figures are taken from the regimental report.

As regards the duration of the cases of diarrhea, no disposition, in a large majority of these cases, appears to have been entered on the records. In 24 cases the diagnosis was changed to typhoid fever in division hospital or on hospital ships.

Of cases diagnosed as fever and febricula, 6 were changed to typhoid fever.

The 8 cases entered as "not diagnosed" were also changed to typhoid fever.

In addition to these cases of typhoid fever, we have been able to trace 21 additional cases found in division hospital and on hospital ships, thus bringing the number to 60 cases for the month of August.

We also find, of the cases of intestinal disease and febricula, 63 of these changed to the diagnosis of malarial fever, 58 of which lasted less than ten days and 5 exceeding that time in duration.

During the month of September the regiment remained in camp at Utuado. On September 24 a detail of three men was made to boil water for the regiment, which heretofore had been done by companies or not at

all, the object being to decrease sickness which, in part, had been caused by water the men drank.

In a mean strength of 42 officers and 1,255 enlisted men for September, we find 1,080 admissions to sick report, divided as follows:

Intestinal disorders.....	619
Malarial fever.....	5
Febricula.....	83
Typhoid fever.....	2
All other causes.....	371

These figures are taken from the regimental report.

Without attempting to enter into detail as to the duration of the cases of intestinal disorder, fevers, and febricula, we may state that 67 of these cases were later changed to the diagnosis of typhoid fever and 130 to the diagnosis of malarial fever.

During the month of October the companies of the regiment were frequently moved from place to place, until October 20 and 21, when the regiment went aboard the transport *Mississippi*, in San Juan harbor. On October 22 the *Mississippi* left San Juan for Boston, arriving there on October 27, when the officers and men were given seven days' leave of absence, and ordered to report on November 3, to be verbally furloughed sixty days.

In a mean strength of 43 officers and 975 enlisted men for the month of October there were 596 admissions to sick report, namely:

Intestinal disorders.....	235
Malarial fever.....	12
Febricula.....	39
Typhoid fever.....	3
All other causes.....	307

We have been able to trace 8 other cases of typhoid fever for this month which were changed from the diagnosis of diarrhea and febricula, and to ascertain that 54 other cases were changed to the diagnosis of malarial fever in division and general hospitals. No further records from this regiment are available for study.

The regiment was mustered out at South Framingham, Mass., January 21, 1899.

SUMMARY.

Mustered into service at South Framingham, Mass., May 13, 1898.

Arrived at Camp Alger, Va., May 22, 1898.

No case of typhoid fever in State encampment.

Probably imported 1 case of typhoid fever into Virginia camp.

Date of first case of recognized typhoid fever after arrival at Camp Alger, June 16, 1898.

Typhoid fever in the Sixth Massachusetts Volunteer Infantry, by months.

	June.	July.	August.	September.	October.	Total.
Recognized cases.....	9	49	60	67	11	196

^a Five of these occurred at Camp Alger and 7 are traceable to infection at Camp Alger.

(Cases of probable typhoid fever not estimated.)

Total cases of recognized typhoid fever.....	196
Number of deaths from recognized typhoid fever.....	18
Per cent of mortality among cases of recognized typhoid fever.....	9.17

Left Camp Alger July 5, 1898, for P. R.

Arrived at Guanica, P. R., July 25, 1898.

Left San Juan Harbor, Porto Rico, October 22, 1898.

Arrived at Boston, Mass., October 27, and furloughed seven days with orders to report on November 3 to be verbally furloughed for sixty days.

EIGHTH OHIO VOLUNTEER INFANTRY.

Second Brigade, First Division, Second Army Corps.

[Maj. E. C. Farquhar, surgeon, U. S. Volunteers.]

REMARKS BY THE BOARD.

This regiment was mustered into service at Columbus, Ohio, on May 13, 1898, and arrived at Camp Alger, Va., on May 19.

Its admissions from May 13, the date of muster in, to May 31, were 39, namely:

Diarrheal diseases.....	11
All others.....	28

All cases were returned to duty after a brief interval, except a case of heart disease, which terminated fatally.

The records of this regiment are very incomplete. The strength for June is not given. The admissions for this month were 67, of which diarrhea contributed 27 cases and all other causes 40 cases.

Intestinal cases were of short duration, except 1 case, admitted to sick report from Company B on July 27; transferred to Second Division Hospital as typhoid suspect, and thence to Fort Myer, Va., where the case was diagnosed as one of pleural effusion of left side, and returned to duty July 25.

The regiment left Camp Alger on July 5 for service in Cuba, arriving at Santiago on July 13. Between the dates July 13 and 28, 26 admissions are recorded, namely:

Diarrhea.....	6
Malarial fever.....	8
Typhoid fever.....	1
All other causes.....	11

Two deaths are recorded for this month—1 from typhoid fever and 1 from malaria.

The case of typhoid fever we note was admitted from Company K on July 12, and hence points to infection prior to the departure from Camp Alger. The soldier died July 28.

The case reported as death from malarial fever was admitted from Company H on July 23, ten days after arrival at Santiago, the soldier dying on July 31. The true character of this case must remain in doubt.

For the months of August, September, and October no reports are accessible.

For the period November 10 to 21, 107 admissions to sick report are reported, of which—

Malaria fevers contributed.....	104
Acute diarrhea.....	1
All other causes.....	2

These patients were all returned to duty after a brief interval. The surgeon remarks: "These are for the most part typical fever and ague cases of the various types, such as are contracted in Cuba."

We have been able to trace 22 cases of typhoid fever admitted from the Eighth Ohio Infantry to the hospitals at Montauk Point, N. Y., between August 25 and September 15. These soldiers were infected in the island of Cuba. Amongst these 22 cases, 9 deaths are recorded.

Among the recruits of this regiment left at Camp Alger we have not been able to trace any cases of typhoid fever, nor have we been able to ascertain what number of recruits belonging to this regiment remained at Camp Alger.

No chart has been prepared for the Eighth Ohio Infantry.

SUMMARY.

Mustered into service at Columbus, Ohio, May 13, 1898.
 Arrived at Camp Alger, Va., May 19, 1898.
 No case of typhoid fever at State encampment.
 Did not import this disease into Virginia camp.
 No case of typhoid fever at Camp Alger, Va., but 1 case occurred on July 12, after the regiment's departure on July 5, thus pointing to infection at Camp Alger, Va.
 Number of cases of recognized typhoid fever for July, August, and September..... 23
 (Probable cases of typhoid fever not estimated).
 Total number of cases of recognized typhoid fever..... 23
 Number of deaths from recognized typhoid fever..... 9
 Per cent of mortality amongst cases of recognized typhoid fever 39.13
 Left Camp Alger, Va., July 5, 1898, for Cuba.
 Arrived at Santiago, Cuba, July 13, 1898.

EIGHTH PENNSYLVANIA VOLUNTEER INFANTRY.

Third Brigade, First Division, Second Army Corps.

[Abstract of surgeon's statement, Maj. C. E. Jouss, U. S. Volunteers.]

This regiment arrived at Camp Alger, Va., on May 18, 1898, from the State encampment at Mount Gretna, Pa.

The health of the men had been good. One case of typhoid fever, a member of Company A, was brought from Mount Gretna and was transferred to Fort Myer on May 20.

The Eighth, Twelfth, and Thirteenth Pennsylvania Volunteer Infantry were brigaded together as the Third Brigade, First Division, and occupied adjoining camp sites. While the general camp site was satisfactory, the three regiments were much crowded for space. Sinks were dug for the reception of excreta to a depth of less than 6 feet, as water was reached at a greater depth. These sinks were on a higher level than the location of the company tents. The water supply at first was obtained from springs and was insufficient. After a few weeks it was obtained from a driven well and was sufficient in quantity. But few cases of typhoid fever have occurred in the Eighth Pennsylvania Infantry to date (August 22).

REMARKS BY THE BOARD.

The sick report begins on May 13. In an average strength for May of 813 officers and men there were only 16 admissions to sick report, chiefly bronchial and pharyngeal affections. One case of intermittent fever, which lasted twenty-four hours, and 1 case of typhoid fever, were admitted. This case, admitted May 15, was sent to Fort Myer on May 20, where the diagnosis was confirmed.

For the month of June, in an average strength of 1,100, there were 53 admissions, as follows:

Acute diarrhea	11
Remittent fever	13
Intermittent fever.....	3
Typhoid fever.....	1
All other causes	25

The diarrheas were returned to duty within three days, except 1 case which lasted ten days.

The malarial diseases were of brief duration, except 1 case diagnosed as remittent fever admitted June 24, transferred to division hospital on June 25, and there pronounced to be a case of typhoid fever.

Two cases of typhoid fever thus occurred during June, as follows: Company A, June 25, 1 case, and Company G, June 29, 1 case.

The regiment occupying its same crowded camp site, we find for July, in an average strength of 1,106 officers and men, 75 admissions to sick report, as follows:

Acute diarrhea	5
Chronic diarrhea	1
Remittent fever	14
Intermittent fever.....	1
Typhoid fever.....	5
Diagnosis reserved.....	1
All other causes	48

The cases of diarrhea were of short duration, except the case of chronic diarrhea, which was sent to division hospital after nine days and furloughed.

Of the 15 cases diagnosed as malarial fever, 14 were treated by the regimental surgeon, and returned to duty as follows: One to four days, 10; five days, 1; fourteen days, 2; 1 was transferred to division hospital, where the diagnosis was changed to typhoid fever.

The case in which the diagnosis was reserved was transferred to Fort Myer and there diagnosed as typhoid fever. Two other cases of this disease not referred to in the regimental report were found at the division hospital and at Fort Myer. We thus find that 9 cases of typhoid fever developed in this regiment for the month of July, as follows:

Date.	Company.	Number of cases.
July 6.....	I.	1
11.....	E.	1
12.....	B.	1
12.....	K.	1
15.....	C.	1
24.....	K.	1
24.....	I.	1
27.....	A.	1
29.....	A.	1
Total		9

The cases of fourteen days' duration, diagnosed as malarial fever, 1 in Company G, beginning July 9, and 1 in Company K, beginning July 9, were probably mild cases of typhoid infection.

During the first week in August this regiment moved to a new and more roomy camp site near Dunn Loring, Va. In a strength of 1,103 officers and men we find 199 admissions to sick report, as follows:

Acute diarrhea	12
Acute gastritis	1
Intermittent fever	8
Malarial fever	18
Remittent fever	58
Typhoid fever	27
All other causes	75

Nine cases of acute diarrhea were treated in quarters and were of short duration, only 1 lasting seven days. One case was furloughed after two days' treatment in quarters and not returned to duty till nearly three months later. Two cases of diarrhea were sent to First Division Hospital, where both were changed to malarial fever and furloughed after two days' treatment.

The case of acute gastritis was transferred to First Division Hospital, changed to intermittent fever, and furloughed after two days.

Of the cases diagnosed as intermittent fever, 3 were treated in quarters and were of the following duration: Four days, 1; five days, 1; nine days, 1. Two cases were furloughed after three days; 1 of these was not returned to duty until three months later; the other could not be traced. Three cases were sent to division hospital; 1 died three days after admission of catarrhal pneumonia; 1 was changed to wryneck, and 1 returned to regiment after two days, without diagnosis.

Of the 18 cases of malarial fever, 10 were treated in quarters and were of less than two days in duration. Four cases were sent to division hospital, where 1 was changed to acute rheumatism and 3 furloughed as remittent fever after three days' treatment. One case was sent to Fort Myer and there diagnosed as typhoid fever. Three cases sent to division hospital were returned to the regiment after thirty-one to thirty-five days, diagnosis unchanged.

Of the 58 cases diagnosed as remittent fever, 34 were treated in quarters, as follows: To duty after one to five days, 30; eight days, 1; nine days, 1; eleven days, 1; eighteen days, 1. We here note that 2 of the cases returned to duty within four days were readmitted three days later and transferred to the hospital train as cases of typhoid fever. Sixteen cases were transferred to the First Division Hospital, of which 4 were changed to typhoid fever, 1 to malarial orchitis, 1 to acute coryza, 3 to remittent fever (of which 2 went to duty after four to nine days), 1 to Pennsylvania Hospital, and 7 could not be traced. Eight were furloughed, of which 1 was returned to duty after sixty days, and 7 could not be traced.

We also find 2 cases of typhoid fever admitted for

August, in which the diagnosis was changed from that given in the regimental report for the same month, as follows: Acute gastritis in 1 case, and remittent fever in another.

In addition, therefore, to the 27 cases of typhoid fever reported by the regimental surgeon, we have traced 7 cases of supposed malarial fever changed to typhoid fever and 2 additional cases in other hospitals, making a total of 36 cases for August, as shown in the following table:

Date.	Company.										Total.
	A.	B.	C.	D.	E.	F.	G.	H.	I.	K.	
August 1										1	1
2				1							1

28											
29											
30											
31											
Total	2	1	5	3	2	10	4	3	3	3	36

This number, we feel sure, does not represent the full prevalence of typhoid fever in this regiment during August. Besides the cases of supposed malarial infection transferred to division hospital or furloughed, concerning which we have been unable to obtain any record, there were 3 cases of malarial fever returned to duty after thirty-one to thirty-five days' treatment in hospital. The latter were probably cases of typhoid fever.

Again, the case of supposed intermittent fever, furloughed on third day of treatment, and not returned to duty until three months later, as well as the case of the same disease dying of catarrhal pneumonia three days after admission to hospital, should, we think, be considered as cases of typhoid fever. With these added the cases of typhoid fever would number 40, which, we think, also falls below the real number for August. It will be seen that the surgeon's claim that only 18 cases of typhoid fever had occurred in this regiment to August 22 can not be substantiated. Had he followed his cases to division hospital he would have found a larger number, and thereby ascertained that his regiment was not an exception to the general prevalence of typhoid fever in the Third Brigade.

The Eighth Pennsylvania Volunteer Infantry was transferred by rail from Camp Alger, Va., to Camp Meade, Pa., on August 30.

In an average strength for the month of September of 1,093 officers and men, we find 134 admissions to sick report, divided as follows:

Acute diarrhea	9
Gastric catarrh	3
Gastroenteritis	1
Intermittent fever	6
Malarial fever	28
Remittent fever	15
Typhoid fever	7
All other causes	65

Of the cases of diarrhea, 7 were treated in quarters and were of less than three days' duration; 2 cases were sent to division hospital and could not be traced.

The 3 cases of gastric catarrh were sent to hospital, where 1 was changed to typhoid fever and 2 could not be traced.

The case of gastroenteritis was furloughed.

Four of the cases diagnosed as intermittent fever were treated in quarters, and returned to duty after two days in three cases, and eighteen days in one case. Two cases of supposed intermittent fever were furloughed after six days, and were not returned to duty until eighty and eighty-two days later.

Twenty-two cases diagnosed as malarial fever were treated in quarters and returned to duty, as follows: After three days, 15; seven days, 7; 4 cases were furloughed and not returned to duty after thirty days; 2 were sent to division hospital, where 1 was changed to typhoid fever, and 1 could not be traced.

Of the 15 cases diagnosed as remittent fever, 6 were returned to duty within 3 days; 1 was sent to division hospital, the diagnosis being changed to typhoid fever, and 8 were furloughed. Of the latter, 5 were returned to duty after thirty, thirty-five, thirty-eight, forty-four, and sixty-nine days, respectively.

In addition to the 7 cases diagnosed as typhoid fever by the regimental surgeon, we find in the First Division Hospital 1 case of "myalgia, acute," and 1 case of tonsillitis changed to typhoid fever; also 4 cases of typhoid fever which do not appear on the regimental reports. A case is also found in the Medico-Chirurgical Hospital, Philadelphia, admitted from Company E, Eighth Pennsylvania, on September 3. Thus we have, for the month of September, 17 cases of typhoid fever, as follows:

Date.	Company.										Total.
	A.	B.	C.	D.	E.	F.	G.	H.	I.	K.	
September 4.....					1	1		1			3
5.....				1							1
6.....						1	1				2
7.....								1			1
8.....		1									1
9.....	1										1
13.....										1	1
14.....	1	1									2
15.....				1							1
20.....		1									1
24.....				1							1
25.....			1								1
26.....							1				1
Total.....	2	3	1	3	1	2	2	2	0	1	17

It will be observed that 12 of the cases occurred during the first half of the month, thus pointing to infection prior to leaving Camp Alger. Could the furloughed cases have been traced, other cases of typhoid fever would probably have been found among these. We call attention here to the 2 cases of intermittent fever furloughed and not returned to duty until nearly three months had elapsed. The marked reduction in the cases for September is, therefore, more apparent than real.

During the succeeding month of October the regiment remained at Camp Meade, Pa. In an average strength of 1,080 officers and men there were 101 admissions to sick report, as follows:

Intestinal disorders.....	10
Intermittent fever.....	2
Malarial fever.....	30
Typhoid fever.....	18
All other causes.....	41

The intestinal disorders and intermittent fevers were short in duration, except 1 case of acute gastritis, which was sent to hospital and changed to typhoid fever.

Twenty-seven cases of malarial fever were treated in quarters and returned to duty after two to six days' treatment. One case was furloughed and returned to duty after twenty-six days, and 2 cases were sent to division hospital and changed to typhoid fever. We also find 2 additional cases of typhoid fever in the First Division Hospital which are not included in the surgeon's statement for October. The surgeon's diagnoses of typhoid fever were all confirmed. The following are the cases of typhoid fever, by company and date, for October:

Date.	Company.										Total.
	A.	B.	C.	D.	E.	F.	G.	H.	I.	K.	
October 1.....	1						1				2
6.....		1									1
7.....								1			1
8.....							1				1
9.....				1							1
13.....		1									1
15.....	1										1
17.....			1				1				2
18.....				1							1
19.....				1							1
23.....	1								1		2
25.....							1				1
26.....				1	2						3
29.....	1							1			2
30.....	1										1
31.....				1						1	2
Total.....	5	2	1	5	2	0	4	2	0	2	23

The regiment remained at Camp Meade, Pa., until November 13, 1898, when it was transferred to Camp McKenzie, Augusta, Ga. The health of the men for this month was very good.

Average strength for November, 1,065, with 62 admissions, as follows:

Acute gastritis	3
Malarial fever.....	3
Remittent fever	8
Typhoid fever	2
Other causes	46

The cases of gastritis and malarial and remittent fever were returned to duty after a few days' treatment, except 1 case of remittent fever transferred to hospital at Lancaster, Pa., and which has not been traced.

The diagnoses in the 2 cases of typhoid fever were confirmed, and a third case was reported from the division hospital. Company C, November 2, 1 case; Company H, November 6, 1 case; Company K, November 8, 1 case.

For December, 1 remittent, lasting five days, was reported. No case of typhoid fever occurred.

Reviewing the development of typhoid fever in this regiment, it will be seen that the regiment, mustered in during the early part of May, arrived at Camp Alger, Va., on May 18, importing 1 case of typhoid fever; that a second and third case did not develop till June 25 and 28; that notwithstanding its crowded camp site only 9 additional cases occurred during the month of July, affecting six companies, while four companies had no cases; that its removal to a new camp site in August did not serve to eradicate the disease, a few cases continuing to occur in all companies, while one company, F, had as many as 10 cases during this month; that a second removal of the regiment, this time to another State, on August 30, did not serve to arrest the development of cases during the following months of September and October in spite of the adoption of very stringent sanitary measures in the new camp and a pure water supply.

SUMMARY.

Mustered into service at Mount Gretna, Pa., early in May, 1898.

Arrived at Camp Alger, Va., May 18, 1898.

Had 1 case of recognized typhoid fever at State camp.

This case was imported into Virginia camp.

Date of first case of recognized typhoid fever after arrival at Camp Alger, Va., June 25, 1898.

Typhoid fever in the Eighth Pennsylvania Volunteer Infantry, by months.

Left Camp Alger, Va., August 30, 1898, for Camp Meade, Pa.

Left Camp Meade, November 13, 1898, and transferred to Camp McKenzie, Augusta, Ga.

TWELFTH PENNSYLVANIA VOLUNTEER INFANTRY.

Third Brigade, First Division, Second Army Corps.

[Abstract of brigade surgeon's statement—Major Parke, U. S. Volunteers.]

The regiment was mustered into service at Mount Gretna, Pa., about the 10th of May, 1898. It arrived at Camp Alger, Va., May 19, 1898.

No case of typhoid fever was brought with the regiment. The first case occurred on June 26, in Company D, the soldier dying at Fort Myer on July 4.

The remarks as to camp site and sanitary arrangements already made in the case of the Eighth Pennsylvania Infantry will apply to this regiment. Water was obtained during the first three or four weeks from a surface spring and was quite insufficient.

To date (August 20) there have been 84 cases of typhoid fever, with 10 deaths. Thirty cases have occurred in one company, G, with 5 deaths. The company consists of men of means, who receive boxes of food frequently from home and have money with which to buy extra articles of food. Company G had its own private well. This well was about 16 feet in depth and was dug the first week after arrival at Camp Alger. Other companies were not permitted to draw water from this well. Its location was between the kitchen and the kitchen sink. There was a privy within 50 feet of the well. According to the surgeon's recollection, the outbreak occurred about two weeks after the completion of this well. The outbreak in the company was sudden, 2 or 3 cases for several days in succession.

The regiment was given a new camp site on August 2, near Dunn Loring, Va., with the result of reducing the number of cases of typhoid fever in Company G and in the regiment as a whole.

Concerning the general origin of typhoid fever in the Pennsylvania brigade at Camp Alger, Major Parke stated that there were numerous "shacks" near by, at which all manner of summer drinks could be purchased, and that much of the water used in washing the glasses and dishes of these vendors was obtained from the open ditches. He had complained to the brigade commander, who had tried to have them abolished, without success. Possibly in this way men became infected.

REMARKS BY THE BOARD.

The first entry on sick report is made on May 21, after the regiment had arrived at Camp Alger. During the last ten days in May, in an average strength of 640 officers and men, there were 41 admissions, divided as follows:

Diarrhea.....	5
Intermittent fever.....	10
Remittent fever.....	2
Typhoid fever.....	0
Other causes.....	24

No case was under treatment more than four days.

Average strength for June, 888; admissions, 54, as follows:

Diarrhea.....	16
Remittent fever.....	13
Typhoid fever.....	1
All other causes.....	24

The cases of diarrhea varied in duration from one to five days.

Ten cases of remittent fever, treated in quarters, were of the following duration: Two days, 3; five days, 2; six days, 1; ten days, 1; seventeen days, 1. Of 2 cases transferred to division hospital, 1 could not be traced; the other case, however, was sent to Fort Myer and changed to the diagnosis of typhoid fever. The case of supposed remittent fever transferred to hospital was admitted on June 30 (Company F).

The case of typhoid fever, diagnosed by the regimental surgeon, was admitted on June 26, transferred to Fort Myer June 27, and died July 4. Thus, for the month of June, 2 cases of typhoid fever developed in the regiment, viz, Company D, June 26, 1 case, and Company F, June 30, 1 case.

The case of supposed remittent fever reported as sent to hospital on June 27 from Company G and not further traceable was probably a third case of typhoid fever.

The regiment occupied its same camp site during July. Strength, 888; admissions to sick report, 156, divided as follows:

Acute diarrhea.....	14
Acute gastritis.....	11
Remittent fever.....	55
Gastro-enteric fever.....	2
Typhoid fever.....	6
All other causes.....	68

Of the 14 cases of diarrhea, 12 were treated in quarters and returned to duty as follows: After three days, 3; four to six days, 5; nine days, 2; nineteen days, 1, while in 1 case no record of the termination is given. One case of diarrhea was furloughed, and died at Williamsport, Pa., of typhoid fever, and 1 case was transferred to Fort Myer and diagnosed as typhoid fever. We note that 25 per cent of the cases of diarrhea were confined to Company G, and that both cases in which the diagnosis was changed to typhoid fever belonged to that company.

Of the cases diagnosed as acute gastritis, 8 were treated in quarters and returned to duty as follows: After three days, 3; five to eight days, 5; 2 cases were transferred to hospital, and in both the diagnosis was changed to typhoid fever. One case could not be traced. We note that 3 of the 11 cases belonged to Company G.

Of the 55 cases diagnosed as remittent fever, 23 were treated in quarters and were of the following duration: One day, 1; four to seven days, 7; eight to ten days, 5; fifteen days, 1; remaining under treatment August 31, after periods varying from thirty-two to fifty-one days, 9. Six cases were furloughed after five to eighteen days' treatment in quarters and could not be traced.

Twenty-six cases were transferred to division hospital and to Fort Myer. In all of these cases the diagnosis was changed to typhoid fever. We note that 29 of the 55 cases diagnosed as remittent fever occurred in Company G. Twenty of these were changed to typhoid fever.

Two cases diagnosed as gastro-enteric fever were transferred to hospital and changed to typhoid fever. One of these belonged to Company G.

In addition to the foregoing cases we find admitted to the general hospital at Fort Myer during July 9 cases of typhoid fever whose names are not borne upon the regimental or division hospital reports. We also find that a case of acute muscular rheumatism, admitted July 22 from Company A and transferred to Fort Myer, was changed to typhoid fever, the soldier dying on August 7. We are thus able to trace 45 cases of typhoid fever in this regiment for the month of July, as follows:

Date.	Company.								Total.
	A.	B.	C.	D.	E.	F.	G.	H.	
July 2.....	1								1
4.....				1					1
5.....						1			1
7.....				1					1
8.....				1					1
11.....				1				1	2
13.....					1				1
16.....								1	1
17.....							3		3
20.....							1		1
21.....							3		3
22.....	2						3		5
23.....						1	2		3
24.....							1	1	2
25.....						1	2	1	4
26.....	1						1		2
27.....							1	1	2
28.....							2		2
29.....							2		2
31.....	1	1					5		7
Total.....	5	1	0	4	1	3	26	5	45

This table, however, does not represent the full prevalence of typhoid fever for July. It certainly falls short in the number of cases occurring in Company G. Cases originating on the following dates and furloughed under the diagnosis of remittent fever after ten to fourteen days' treatment should, we think, be added to its typhoid-fever list, viz: July 16, 1 case, and July 23, 3 cases. Also cases remaining under treatment in quarters August 31, which were admitted to sick report as follows: July 23, 1 case, July 28, 1 case, and July 31, 2 cases. Thus making a total of 34 cases occurring in this one company.

The following companies should be credited with additional cases of probable typhoid fever, admitted as cases of remittent fever and treated by the surgeon for periods varying from thirty-two to fifty-one days, and not yet returned to duty, viz:

Date.	Company.	Number of cases.
July 5.....	F	1
6.....	B	1
10.....	D	2
19.....	H	1
22.....	A	1
26.....	A	1
29.....	H	1
Total.....		8

Thus we find 45 cases of recognized typhoid fever in the Twelfth Pennsylvania Volunteer Infantry for July, and 16 probable cases of this disease, making a total of 61 cases, distributed as follows:

Company.	Number of cases.
A.....	7
B.....	2
C.....	0
D.....	6
E.....	1
F.....	4
G.....	34
H.....	7
Total.....	61

Taking this number as approximately correct, we find that of 11 cases occurring up to the 15th of July none had occurred in Company G, whereas of the 50 cases occurring during the latter half of the month 34 were confined to this company. This would appear to point to some particular source of infection for G Company.

Attention at once turns to the shallow well owned by this company, and from the use of whose water the other companies were said to have been excluded. Considering this well as a probable source of infection, its water seems to have escaped contamination from the time of its construction during the latter part of May until the first week in July, as G Company's epidemic did not begin until July 17.

While this well was liable to infection at any time from the battalion privy, located about 50 feet away, we have already pointed out that the first cases of typhoid fever to occur in this regiment after its arrival at Camp Alger were on June 26 and 30. The chances for the possible infection of the contents of the privy were afforded, therefore, at that time and subsequently. We also observe that, contrasted with the dry weather during the first week in June, there was a rainfall of 0.35 of an inch on June 25, 0.80 of an inch on June 28 and 29, and 0.35 of an inch on July 5 and 6. The conditions, therefore, seem to have been favorable for the contamination of this well with typhoid dejecta about the first week in July, allowing a few days for seepage through the intervening soil.

It was a matter of regret to the board that the exact location of this well could not be ascertained at the time of the board's visit to Camp Alger, although earnest effort was made in this direction. The old camp site having been abandoned some four weeks earlier, all landmarks had already disappeared and the site of the well was thoroughly obliterated. Nevertheless, from evidence before us and from the course of the outbreak we are of the opinion that its own private water supply was the source of the infection in Company G.

It is important to observe, as bearing on the occur-

rence of milder typhoid infections, that in addition to the 2 cases of acute diarrhea in this company in which the diagnosis was changed to typhoid fever there were 4 other cases of diarrhea, as follows: July 15, 1 case, duration six days; July 25, 2 cases, duration nine days each, and July 29, 1 case, duration five days.

Of cases diagnosed as acute gastritis there were 3, viz: July 23, 1 case, duration five days; July 26, 1 case, duration not stated, and July 27, 1 case, duration not stated.

Of milder fevers occurring in this company during the typhoid fever epidemic there were 4 cases, as follows: July 21, 1 case, duration eight days; July 23, 1 case, duration five days; July 26, 1 case, duration ten days; July 31, 1 case, duration six days.

In other words, in addition to the 34 cases of prolonged fever, there were during the same period 11 milder infections, diagnosed as diarrhea, gastritis, or remittent fever, as compared with 1 case of diarrhea of two days' duration, recorded in this company for the first fifteen days of the month. Company G's private well was filled in soon after the outbreak began—that is, between the 17th and 25th of July. It has not been possible to obtain the exact date of the abandonment of this well, except in a rough way, as first mentioned. If the use of the water from this well has been responsible for the epidemic in the company, and if the well were closed between the dates mentioned, then we should expect a marked reduction some time between the 1st and 10th of August.

Concerning the record, we find the admissions for this company for August as follows: August 2, 2 cases; August 5, 2 cases; August 9, 1 case; August 22, 1 case, and August 25, 1 case; thus pointing to this well as the probable source of the outbreak.

On August 2 the Twelfth Pennsylvania Infantry was moved from its crowded camp site, which it had occupied for two months and fourteen days, and went into a new camp on an elevated and sloping piece of ground near Dunn Loring, Va. The regiment was well separated from other organizations; its water was obtained from a driven well which furnished an abundant supply, and every care was taken as to the sanitary condition of the camp. Sinks for excreta were located at the bottom of the incline, and each man was made to cover his stool with earth as soon as deposited. Upon leaving the latrine each soldier was required to wash his hands with soap and water before returning to the company street. These regulations were carefully carried out under the supervision of a sentinel posted at each latrine for this purpose.

At the time of the board's inspection (August 23) the general sanitary condition of this camp was very good.

The regiment having been established in its new

camp on August 2, we find for this month, in an average strength of 877 officers and men, 171 admissions, divided as follows:

Acute diarrhea.....	2
Malaria.....	27
Remittent fever.....	85
Continued fever.....	1
Typhoid fever.....	26
All other causes.....	30

Of the 2 cases of diarrhea, 1 was changed to remittent fever and furloughed after six days; the other case could not be traced.

Of the 27 cases diagnosed as malaria, 26 were treated by the surgeon in quarters, with the following result: Returned to duty within seven days, 14; eight to ten days, 2; furloughed after three to nine days, 3; while in 7 cases admitted during the last week in August no termination is given. One case of malaria was transferred to hospital and changed to typhoid fever.

Of the 85 cases diagnosed as remittent fever, 43 were treated in quarters, of which 21 were furloughed within one to five days and 1 after thirteen days' treatment; 9 were returned to duty after four days; 2 within fourteen days; 1 changed to rheumatism and furloughed, and 9, taken sick within the last week of July, had no termination given. Forty-two cases diagnosed as remittent fever were transferred to division and general hospitals; of these 5 were returned to the regiment within seven days, with diagnoses unchanged; 2 were changed to heat prostration; 1 to acute diarrhea; 13 were changed to the diagnosis of typhoid fever, and 21 could not be traced.

The case of continued fever was transferred to hospital and changed to typhoid fever.

Of the 26 cases diagnosed by the regimental surgeon as typhoid fever, 8 were furloughed within three days and could not be further traced; 18 were transferred to hospital, of which 1 was changed to quinsy; 1 returned to duty after three days without diagnosis; 1 could not be traced, and in 15 cases the diagnosis was confirmed.

It will be seen that it is impossible to accurately approximate the prevalence of typhoid fever in this regiment during August, owing to the number of furloughs given, especially during the latter half of the month, for supposed malarial and typhoid fevers. Not less than 33 men were furloughed for these causes within the first week of their illness, generally within three days from the beginning of the attack. In 16 other cases no termination is given to the attack, while in 9 additional cases the hospital records fail to show that the cases ever reached the hospital. While some of these were undoubtedly typhoid fever, the majority, we think, can be ascribed to other causes. The following table gives the undoubted cases of typhoid fever occurring during August, with company and date:

Date.	Company.								Total.
	A.	B.	C.	D.	E.	F.	G.	H.	
August 1.....		1	1					1	3
2.....	1						2		3
3.....								1	1
4.....		1							1
5.....							2	3	5
6.....		1							1
9.....					1		1		2
11.....		1							1
12.....	1	1							2
13.....			1			1			3
14.....			1						1
15.....	1	1		1					3
17.....		1			1				2
19.....								1	1
21.....			2						2
22.....							1		1
23.....		1							1
25.....		2	2		2		1	1	8
Total.....	3	10	7	1	5	1	7	7	41

In connection with the occurrence of typhoid fever by companies as shown in the foregoing table, we here refer to the number of men furloughed during August from the several companies for supposed malarial and typhoid fevers as follows:

Date.	Company.	Number of cases.
August 18.....	A.	2
August 8.....	B.	1
August 4, 10, 18, and 21.....	C.	5
August 15 and 23.....	D.	4
August 7, 9, 17, 18, 21, 22, and 25.....	E.	9
August 12, 13, 15, 16, 21, and 31.....	F.	6
August 5 and 9.....	G.	3
Total.....		30

It will also be seen that the number of cases of typhoid fever and the number of furloughs markedly decrease after the third week in August. This decrease we believe to have been influenced by the change of camp site on August 2, as well as by the strict sanitary measures enforced by the regimental authorities. That these did not suffice to stamp out the disease entirely will be seen by an examination of the records of the First Division Hospital at Camp Meade, Pa., to which point the regiment was transferred on August 29, 1898.

No regimental report later than that for August is available for study.

The following table gives the cases of typhoid fever for September, as shown by the records of the First Division Hospital, Camp Meade, and of the Pennsylvania State hospitals:

Date.	Company.								Total.
	A.	B.	C.	D.	E.	F.	G.	H.	
September 1.....					1	1	1	1	4
2.....	1	1	1						3
3.....		1					1		2
4.....		1							1
5.....						2			2
7.....			1	1			1		3
8.....	1		1						2
9.....	1								1
10.....									0
13.....	1								1
Total.....	4	3	3	1	1	4	2	1	19

We also find in the division hospital, admitted during the first week in September, 4 cases of supposed malarial fever; all furloughed after two to seven days in the hospital.

The regiment left Camp Meade, Pa., on September 19, 1898, under orders to be mustered out of the service. Only one case of typhoid fever is recorded during the last ten days of the regiment's stay at this camp.

Reviewing the progress of typhoid fever in this organization, we find that the regiment, having been mustered into service about May 10, reached Camp Alger, Va., from its State camp on May 19, not importing any case of typhoid fever; that 2 cases developed on June 26 and 30; that up to the middle of July, 8 other cases had occurred, affecting five different companies; that beginning with July 17, an outbreak occurred in Company G, probably due to infection of a shallow well, amounting to 26 cases for the month, while for the same period the remaining seven companies only furnished 10 cases; that notwithstanding a change of camp site made on August 2, 41 cases are recorded for this month, and 16 cases for the period September 1 to 13, following a second change of camp to Middletown, Pa., on August 31. The course of the disease in this regiment, excepting the outbreak in Company G, was such as to exclude any contamination of the general water supply.

SUMMARY.

Mustered into service at Mount Gretna, Pa., May 10, 1898.

Arrived at Camp Alger, Va., May 19, 1898.

No case of typhoid fever in State camp.

No case of typhoid fever imported into Virginia camp.

Date of first case of typhoid fever after arrival at Camp Alger, Va., June 26, 1898.

Typhoid fever in the Twelfth Pennsylvania Volunteer Infantry, by months.

Left Camp Alger August 29, 1898, by rail for Camp Meade, Pa.

THIRTEENTH PENNSYLVANIA VOLUNTEER INFANTRY.

Third Brigade, First Division, Second Army Corps.

[Abstract of surgeon's statement—Maj. W. A. Keller, U. S. Volunteers.]

The regiment was assembled at Scranton, Pa., from which point it went to Mount Gretna, Pa., on April 28, 1898.

During the three weeks that it was in the latter camp the sick report was very small. There was no case of typhoid fever.

The regiment arrived at Camp Alger, Va., on May 19, and was placed in camp between the Eighth and Twelfth Pennsylvania Infantry. The only water supply was obtained from a small spring, down the hill beyond the Twelfth Regiment. As the spring was shallow and the surface drainage could reach it, a barrel was sunk and cracked stones placed in and around it. This spring was used for four to six weeks. The Fourth Missouri Volunteer Infantry went into camp about one week after the Thirteenth Pennsylvania arrived, and was located on higher ground than this spring and only about 100 yards distant from it. This regiment had 2 cases of typhoid fever.^a An official complaint was promptly lodged with the War Department against the water supply, and while waiting for a well to be sunk by the Department the regiment constructed a well of its own, located on high ground and about 200 yards distant from the Fourth Missouri's camp site. This well was about 18 feet in depth and at least 100 yards from the regimental sinks and on higher ground. This water was largely used for cooking purposes. During the latter part of June water was obtained from a driven well and was used in common with the Twelfth Pennsylvania Infantry.

June 23 and 24 the regiment went on a practice march to Cabin John Bridge and return, the men drinking water along the line of march wherever it could be obtained.

The first case of typhoid fever appeared on July 2. Thirteen other cases of typhoid fever occurred during the month.

A second march to the Potomac and return was made on July 12.

The regiment vacated its first camp site on July 18 and went into a second camp near Dunn Loring, Va. No cases of typhoid fever appeared between July 31 and August 9. From that date to the present time

^aThis is an error.—W. R.

(August 23) 5 cases have occurred, bringing the total up to 19 cases, with 4 deaths.

No cases of malarial remittent fever occurred in the first, but about 25 cases have occurred in the second camp. In the latter camp water has been hauled in barrels from various sources, pending the sinking of a deep well, which has just been completed (August 23).

The Thirteenth Pennsylvania Volunteer Infantry has been as badly treated in the matter of its water supply as any regiment at Camp Alger, being compelled to use water during May and the greater part of June from a shallow surface spring, and July 18 to August 23 from any source available. It has been largely obtained during this time from the wells of the Third Virginia Infantry and First Connecticut Infantry. The drinking water has not been boiled at any time.

Major Keller did not attribute the occurrence of typhoid fever in his regiment to the water supply, but rather to the abominable drinks of all descriptions furnished by the proprietors of shacks. These venders were not permitted to use the deep-well water, and hence resorted to all manner of expedients in obtaining water, such as from an old abandoned well near the division headquarters. It was reported that they used ditch water to cleanse their dishes and utensils. It was impossible to prevent the men from wandering over the surrounding country and obtaining water from various sources.

REMARKS BY THE BOARD.

For the period May 13 to 31, in an average strength of 36 officers and 604 enlisted men, there were 47 admissions to sick report, as follows:

Acute diarrhea	7
Intermittent fever	1
Typhoid fever	0
Other causes and injuries	39

The diarrheas were promptly returned to duty, except 1 case of twelve days' duration.

For June, in an average strength of 36 officers and 856 enlisted men there were 199 admissions. Concerning this large number Maj. C. R. Parke, regimental surgeon, states that the majority are due to vaccination and diarrhea. He notes the occurrence of several cases of typhoid fever in the Third Brigade, First Division, Second Army Corps, and recommends that drinking water should be boiled.

The causes of admissions were divided as follows:

Acute Diarrhea	97
Acute dysentery	1
Cholera morbus	6
Malarial fever	0
Typhoid fever	1
Other causes (largely vaccinia)	94

All cases of intestinal disorders were mild in character and soon returned to duty, except the case of dysentery which was transferred to Fort Myer.

The case of typhoid fever dated from June 20, and

was an officer of Company C. Diagnosis was confirmed at Fort Myer.

The health of this regiment was, therefore, very satisfactory from May 19 to June 30, notwithstanding its varied water supply and crowded camp site. Diarrhea was prevalent during June, all companies being about equally affected.

The regiment continued to occupy the same camp site till July 18. Average strength for July: Officers, 36; enlisted men, 842; admissions, 171, divided as follows:

Acute diarrhea	51
Dysentery	2
Ephemeral fever	7
Malarial fever	4
Typhoid fever	15
All other causes	92

The cases of intestinal disease were all mild in character.

The fevers, ephemeral and malarial, were soon returned to duty, except 1 case of the former and 1 case of the latter, which were transferred to Fort Myer and changed to typhoid fever.

In addition to the 15 cases of typhoid fever, in all of which the diagnosis was confirmed at Fort Myer, 2 cases of influenza which were transferred to Fort Myer general hospital were changed to typhoid fever and 1 changed to typhoid fever in division and other hospitals. We thus find 20 cases of this disease in the Thirteenth Pennsylvania Infantry during July, as follows:

Date.	Company.								Total.
	A.	B.	C.	D.	E.	F.	G.	H.	
July 2				1					1
4								1	1
6		1							1
8				1					1
9					1				1
10		1		1			1		3
14	1								1
16		1							1
17						1			1
21							1		1
22			1						1
25						1		1	2
28	1								1
30				1		1		1	3
31							1		1
Total	2	3	1	4	1	3	3	3	20

The regiment being established in its new camp on July 18, we find in an average strength for August of 31 officers and 839 enlisted men 214 admissions to sick report from all causes, divided as follows:

Acute diarrhea	38
Acute dysentery	3
Ephemeral fever	20
Malarial fever	18
Typhoid fever	7
All other causes	128

The intestinal disorders were returned to duty within a week, except 2 cases furloughed and changed to insolation and 1 case of dysentery transferred to a Philadelphia hospital. This case was later changed to typhoid fever.

Nine cases of ephemeral fever were treated in quarters; 6 cases being returned to duty within four days; after six days, 1; seven days, 1; nine days, 1. Six cases were furloughed after being under treatment from three to eleven days and could not be traced; 3 transferred to division hospital, of which 2 were changed to typhoid fever. Two cases were sent to Philadelphia hospitals, where both were changed to the diagnosis of typhoid fever.

Of the 18 malarial fevers, 6 were treated in quarters and returned to duty after two, three, six, seven, and nine days; 11 were sent to division and other hospitals, of which 3 were changed to typhoid fever and 8 could not be traced. One case of supposed malarial fever was sent to Garfield Hospital, Washington, D. C., and was there changed to typhoid fever.

In addition, therefore, to the 7 cases diagnosed by the regimental surgeon we find 1 dysentery changed to typhoid fever, 4 ephemeral fevers changed to typhoid fever, 4 malarial fevers changed to typhoid fever, making in all 16 cases for the month of August, as follows:

Date.	Company.									Total.
	A.	B.	C.	D.	E.	F.	G.	H.	Staff.	
August 10.....									1	1
12.....		1								1
13.....							1			1
15.....			1		1					2
18.....	1	1								2
21.....			2				1			3
22.....							1			1
23.....			1	1						2
25.....			1				1		1	3
Total.....	1	2	5	1	1	0	4	1	1	16

The regiment having changed station to Camp Meade, Pa., on August 31, we find for September, in an average strength of 36 officers and 827 enlisted men, 162 admissions, as follows:

Acute diarrhea.....	18
Ephemeral fever.....	13
Malarial fever.....	30
Typhoid fever.....	12
All other causes (largely bronchial and nasal catarrh).....	89

Of the diarrheas, 13 were treated in quarters and returned to duty within six days; 5 were sent to division hospital, where 3 were furloughed as remittent and 2 changed to typhoid fever.

Two cases of ephemeral fever treated in quarters were of brief duration (three days). Of 11 cases sent to hospital, 3 could not be traced and 8 were changed to typhoid fever.

Twenty-two cases diagnosed as malarial remittent were returned to duty as follows: One to four days, 14; five to seven days, 6; ten to thirteen days, 2. Of 8 cases sent to division hospital, 4 were changed to typhoid fever, 2 to remittent fever, and 1 to acute gastritis and furloughed after 10 days.

One case of influenza transferred to hospital was changed to typhoid fever.

Six cases of typhoid fever were found in hospitals and not accounted for by the regimental surgeon.

Thus, to the 12 cases of typhoid fever diagnosed by the surgeon and confirmed, we find in addition the following diagnoses changed to that disease:

	Cases.
Diarrhea.....	2
Ephemeral fever.....	8
Malarial fever.....	4
Influenza.....	1
Not accounted for.....	6
Total.....	21

making a total of 33 cases for September, as follows:

Date.	Company.									Total.
	A.	B.	C.	D.	E.	F.	G.	H.	Staff.	
September 1.....				1	3					3
2.....				1			1			3
3.....	2		1		1					4
4.....					1					1
5.....			1				1			2
6.....						1			1	2
7.....				1						1
8.....					1					1
11.....		1								1
14.....			1							1
15.....	1		1							2
16.....								2		2
20.....			1							1
22.....	1		1							2
23.....	2									2
24.....	1							1		2
26.....				1						1
27.....			1							1
28.....				1						1
Total.....	7	1	9	3	6	1	4	1	1	33

Eighteen of these cases, occurring within eleven days of arrival at Camp Meade, Pa., may be considered as infections at Camp Alger, Va.

The same camp having been occupied during October, the surgeon remarks on the sick and wounded report that "the health of this command during the month has shown a decided improvement; typhoid fever is being gradually stamped out, malarial fever is on the increase, but the cases are not of a very severe type."

Average strength for October: Officers, 25; enlisted men, 654. Admissions, 146, as follows:

Acute diarrhea.....	13
Malarial fever.....	51
Typhoid fever.....	8
Convalescent from typhoid fever.....	4
Other causes.....	70

Twelve cases of diarrhea treated in quarters were of short duration, except two cases lasting fifteen to nineteen days. One case was sent to division hospital and transferred to a Philadelphia hospital the following day and could not be further traced.

Thirty-five cases diagnosed as malarial fever were treated in quarters, 32 of these lasting less than five days; seven to nine days, 2, and seventeen days, 1. This case was complicated with diarrhea. Fifteen cases of malarial fever were sent to division hospital, of which 5 were furloughed as remittent fever after two to twenty days' treatment, 5 transferred to other hospitals as remittent or intermittent fever, and 5 changed

to the diagnosis of typhoid fever. Of the cases transferred to other hospitals as malarial fever, 2 cases diagnosed as intermittent fever have been traced and found changed to typhoid fever.

The cases diagnosed as typhoid fever were confirmed.

The 4 cases of typhoid-fever convalescents have been already accounted for during August and September. One case of typhoid fever was found in the Second Division Hospital, Second Army Corps, and 5 cases in Pennsylvania hospitals not accounted for on the regimental report. The total cases found for October, therefore, were 21, as follows:

Date.	Company.								Total.
	A.	B.	C.	D.	E.	F.	G.	H.	
October 1.....				2	1				3
3.....	1			1				1	3
5.....					1				1
6.....							1		1
7.....			1						1
8.....	1			1					2
11.....			1						1
15.....	1						1		2
18.....						1			1
19.....		1							1
23.....							1		1
24.....		1							1
26.....							1		1
27.....		1							1
30.....						1			1
Total.....	3	3	2	4	2	2	4	1	21

The regiment remained at Camp Meade, Pa., till November 14, when it left for Augusta, Ga.

The surgeon states on November report that the health of the regiment rapidly improved; that typhoid and malarial fever are on the decrease, and that the location of the camp from a hygienic standpoint is ideal.

Average strength for November: Officers, 26; enlisted men, 718. Admissions, 149, as follows:

Diarrhea.....	6
Malarial fever.....	15
Typhoid fever.....	6
Typhoid convalescents.....	3
All other causes.....	119

The diarrheas were of short duration.

Twelve cases of malarial fever were returned to duty within three days; 1 case, seven days; 1 case, twelve days, and 1 case, twenty-seven days.

One typhoid convalescent has been accounted for among the August cases. The date of commencement of the other two can not be told. They do not belong to cases originating in November.

Thus for November the cases of typhoid fever fell to 6, distributed as follows:

Date.	Company.	Number of cases.
November 22.....	E	1
7.....	B	1
10.....	B	1
7.....	H	1
28.....	D	1
19.....	A	1
Total.....		6

No cases of typhoid or malarial fevers are reported for December.

SUMMARY.

Assembled at Scranton, Pa., from which point the regiment went to Mount Gretna, Pa., April 28, 1898.

Arrived at Camp Alger, Va., May 19, 1898.

Had no case of typhoid fever at State encampment.

Did not import typhoid fever into Virginia camp.

Date of first case of recognized typhoid fever after arrival at Camp Alger, June 20, 1898.

Typhoid fever in the Thirteenth Pennsylvania Volunteer Infantry, by months.

Left Camp Alger August 31, 1898.

Arrived at Camp Meade, Pa., August 31.

Left Camp Meade, Pa., for Augusta, Ga., on November 14, 1898.

THIRD VIRGINIA VOLUNTEER INFANTRY.

Not brigaded, First Division, Second Army Corps.

[Abstract of surgeon's statement—Maj. William Smith, U. S. Volunteers.]

The regiment was mustered into service May 14, 1898, at Richmond, Va., where it remained encamped till June 5, 1898.

The health of the men was satisfactory. Only a few cases of measles and diarrheal diseases prevailed. No case of typhoid fever occurred.

The regiment reached Camp Alger, Va., June 5, 1898, and was placed in a camp whose site is described as "isolated and well drained, with an abundant supply of good spring water." Later water was obtained from a deep well. The regiment occupied this camp till the 1st of August, when it was removed to a camp near Dunn Loring, Va.

Two cases of typhoid fever occurred in the first camp. One of these was imported with the regiment; the other occurred later, and its origin was not accounted for. The men were much in the habit of visiting surrounding farmhouses. The regimental surgeon, himself a resident of Alexandria, Va., was prepared to state that the section of country around about Camp Alger was notorious for typhoid fever during the summer and fall seasons.

REMARKS BY THE BOARD.

In a strength for May of 47 officers and 963 enlisted men there were 31 admissions to sick report for the period May 14 to 31, about equally divided between mild intestinal disorders and measles. No case of typhoid fever occurred.

From June 5 to August 1 this regiment occupied the same camp site at Camp Alger, Va.

Strength for June: Officers, 47; enlisted men, 935. Admissions, 478, as follows:

Diarrhea.....	102
Dysentery.....	19
Intermittent fever.....	28
Remittent fever.....	3
Continued fever.....	1
Typhoid fever.....	2
All other causes.....	323

Measles was prevalent during the month.

Only 2 cases of intestinal disorder were sent to hospital. These were returned to duty after eight to eleven days' treatment. All other cases were of short duration, both diarrheal and dysenteric.

The cases diagnosed as intermittent fever were treated in quarters and returned to duty as follows: After two to four days, 18; five to six days, 8; ten to twelve days, 2.

The 3 cases diagnosed as remittent fever lasted nine to eleven days.

There is no record of the duration of the case diagnosed as continued fever. This soldier was admitted to sick report June 19, and was still reported sick in the Second Division Hospital June 30. He was a member of Company B, from which 2 cases of typhoid fever were admitted on June 6 and June 22, respectively. Both of the latter cases terminated fatally. It is possible that this was also a case of typhoid fever.

We observe, however, that Private S. W., Company E, who was admitted with diarrhea on June 6 and returned to duty June 8, was readmitted on June 9 and sent to the Fort Myer General Hospital on June 16, where his case was diagnosed as typhoid fever.

Thus we find that this regiment imported at least 2 cases of typhoid fever into Camp Alger.

A third case was admitted on June 22. This soldier was, by the colonel's order, sent to a farmer's house, where he died July 7.

The foregoing, together with a case admitted from Company K on June 2 as diarrhea, and reported from the Third Division Hospital on June 24 as typhoid fever, make 4 typhoid fever cases for June.

It is worth noting that 2 of the cases diagnosed as remittent fever and lasting from nine to eleven days, respectively, were also admitted on June 19 from Company B.

The surgeon, in his remarks on June report, makes mention of 2 deaths from typhoid fever during June. Both of which occurred away from the regiment. One

of these died at Fort Myer on June 26—Private E. S., Company B. No record of the other case can be found.

Strength for July: Officers, 47; enlisted men, 1,046. Admissions, 357, as follows:

Acute diarrhea.....	64
Dysentery.....	14
Intermittent fever.....	22
Remittent fever.....	10
Continued fever.....	1
Typhoid fever.....	2
All other causes.....	244

The cases of diarrhea and dysentery were all of short duration, only 2 cases of dysentery lasting seven days. No one company was particularly affected, except Company D, which had 20 cases.

Cases diagnosed as intermittent fever were returned to duty as follows: After three to four days, 11; five to seven days, 6; eight to ten days, 4; twenty-one days, 1.

The cases of remittent fever were returned to duty after three to six days. One case, however, from Company K, admitted July 1 and to duty July 4, appears July 8 in the Second Division Hospital as a case of typhoid fever, the diagnosis being confirmed later at Fort Myer.

The case of continued fever was changed to typhoid fever at the division hospital.

We thus find, in addition to the 2 cases reported by the surgeon, 2 other cases of typhoid fever changed respectively from remittent fever and continued fever. The dates of occurrence were as follows: Company K, July 1, 1 case; Company E, July 9, 1 case; Company E, July 16, 1 case, and Company A, July 28, 1 case.

We also find recorded in the August report 2 cases of typhoid fever as admitted July 25 and 27 from Company L, one of which proved fatal on August 18, thus making a total of 6 cases of this disease for the month of July.

Of the 10 cases reported for June and July, 5 terminated fatally. This mortality would point to a larger number of cases in this regiment, but no available records can determine this.

About August 1 the regiment abandoned its first camp, occupied since June 5, and went into camp near Dunn Loring, Va., near the camp of the First Connecticut Volunteer Infantry. Its water supply was obtained from a driven well.

Strength for August: Officers, 47; enlisted men, 1,248. Admissions, 257, divided as follows:

Diarrhea.....	19
Dysentery.....	2
Intermittent fever.....	12
Remittent fever.....	27
Typhoid fever.....	7
All other causes.....	190

Intestinal disorders were of short duration, except 1 case transferred to hospital and changed to typhoid fever.

Of the cases diagnosed as intermittent fever, 9 were of less than seven days' duration; 1 lasted twelve days; 1 was of twenty days' duration, and 1 was furloughed.

Of the cases diagnosed as remittent fever, 2 were returned to duty after eight days' treatment; 20 cases were furloughed; 5 were transferred to hospital and changed to typhoid fever. There were also found 2 cases in the Second Division Hospital and 3 cases at Fort Myer diagnosed as typhoid fever, but which were not accounted for by the regimental surgeon. We are thus able to trace 18 cases of typhoid fever for August.

This, we believe, falls below the full prevalence of typhoid fever in this regiment for August. Could the 21 cases furloughed as remittent and intermittent fever be followed up, we believe that the majority would prove to be cases of typhoid fever.

It is not possible to further trace the occurrence of typhoid fever in this regiment. It left Camp Alger, Va., on September 8 for Richmond, Va., where the men were furloughed for thirty days.

The surgeon states that the prevailing diseases for the month of September were typhoid and malarial fevers; that many of the men were taken sick at home while on furlough; and that much difficulty was found in ascertaining the causes of sickness. He reports the names of 8 enlisted men having typhoid fever, 2 of whom were taken sick prior to departure from Camp Alger and 6 while on furlough. We have been able to add to these 8 cases 3 other cases for September, which were found in the Old Dominion Hospital, Richmond, Va., thus making 11 cases for the latter month. Four other cases were also admitted to the same hospital during October, but as we have not been able to ascertain the dates of the admission to sick report, these have not been charted with the other cases occurring in this regiment.

SUMMARY.

Mustered into service at Richmond, Va., May 14, 1898.

Arrived at Camp Alger, Va., June 5, 1898.

Had no case of typhoid fever at State encampment.

Imported two cases of recognized typhoid fever into its camp at Alger.

Date of first case of recognized typhoid fever after arrival at Camp Alger, June 22, 1898.

Typhoid fever in the Third Virginia Volunteer Infantry, by months.

	June.	July.	August.	September.	October.	Total.

Probable cases.....						27
Total.....	4	6	18	11	4	70

Total cases of recognized typhoid fever..... 43

Probable cases of typhoid fever..... 27

Total cases of recognized and probable typhoid fever..... 70

Number of deaths from recognized typhoid fever..... 13

Per cent of mortality among recognized cases of typhoid fever..... 30.23

Per cent of mortality among cases of recognized and probable typhoid fever..... 18.57

Left Camp Alger September 8, 1898, for Richmond, Va.

FIRST CONNECTICUT VOLUNTEER INFANTRY.

Not brigaded, First Division, Second Army Corps.

[Abstract of surgeon's statement—Maj. T. F. Rockwell, U. S. Volunteers.]

The regiment was mustered into service May 14, 1898, at Niantic, Conn.

Companies F and K left Niantic for Fort Preble, Me., May 24, where they remained during June and a part of July. Companies I and E were sent to Plum Island, N. Y., May 29, and Company C to Portsmouth, N. H. Headquarters and four companies were located at Fort Knox, Me., during June and part of July.

The health of the several detachments was very good. No case of typhoid fever occurred in any of the companies prior to arrival at Camp Alger, Va., on July 19. The water supply after arrival was obtained at first from the Third Virginia Infantry's well, and later from a deep well bored for the regiment. Its camp site was well drained and suitable.

REMARKS BY THE BOARD.

A careful examination of the sick report of the scattered companies of this regiment for May and June at Fort Preble, Me., Portsmouth, N. H., Plum Island, N. Y., Great Gull Island, N. Y., and Fort Knox, Me., confirms the statement of the regimental surgeon as to the general good health of the regiment and the probable absence of typhoid fever prior to arrival at its Virginia camp.

Eight cases of malaria are recorded for May, and 7 cases of the same for June. These were of short duration, except 1 case admitted from Company F at Fort Preble, Me., which was of twenty days' duration.

Intestinal disorders were rare.

We note, however, the admission from Company M on July 16 of a case of "typhoid malaria" which was left behind at Niantic, Conn. Whether this case proved to be one of typhoid fever can not be stated.

The regiment reached Camp Alger, Va., July 19. Its mean strength for July was: Officers, 45; enlisted men, 1,174; admissions for the month from all causes, 230, divided as follows:

Acute diarrhea.....	103
Malaria.....	14
Typhoid fever.....	0
Typhoid malaria.....	3
All other causes (among which venereal diseases, Rhus poisoning, and heat prostration figure prominently).....	110

The diarrheas were mild, exceptionally lasting longer than two days.

The cases diagnosed as malaria were of short duration, except 1 case of ten days, admitted July 30.

One of the cases diagnosed as typhoid malaria was returned to duty after four days, and 1 case was left behind at Niantic, Conn. The third case, admitted from Company H, July 26, without any termination being given, is again admitted August 10 as acute diar-

rhea, and returned to duty August 12, from which it appears that although a case of typhoid fever was probably left at Niantic, no case was brought with this regiment to Camp Alger.

During the following month (August) in an average strength of 48 officers and 1,276 enlisted men we find 470 admissions, as follows:

Acute diarrhea	328
Malaria	42
Typhoid malaria	1
Typhoid fever	21
All other causes	78

Of the cases of acute diarrhea, 157 lasted only twenty-four hours; two to three days, 105; four to six days, 31; seven to ten days, 9; eleven to fifteen days, 4; thirty seven to forty days, 3; sixty-six days, 1, and 3 furloughed after twelve days' treatment.

Diarrheal diseases were distributed as follows:

	Cases,
Company A	27
B	24
C	34
D	24
E	25
F	48
G	38
H	23
I	35
K	22
L	12
M	13
Staff	3
Total	328

Companies D, K, L, and M had somewhat fewer cases of diarrhea than the other companies.

Of the cases diagnosed as malaria, 16 were returned to duty after twenty-four hours; two to three days, 7; four to six days, 9; seven to eleven days, 4; fourteen days, 1; eighteen days, 1; twenty-one days, 1; thirty-one days, 1; sixty days, 1, and 1 case furloughed after four days.

We also find 5 cases of remittent fever in the First Division Hospital, of which 4 were returned to duty after four, five, six, and eleven days, and 1 was furloughed after two days.

The case diagnosed as typhoid malaria was treated in quarters and returned to duty after twenty-four days. This case was admitted to sick report August 6.

The first cases diagnosed as typhoid fever were admitted August 5 and 6, respectively, from Company I, and on August 6 from Company K. Twenty-one additional cases were admitted during August. For occurrence by date and distribution by companies the chart of this regiment should be consulted.

If to the above cases there should be added the case diagnosed as typhoid malaria which lasted twenty-four days and the 5 cases of supposed malaria lasting from fourteen to sixty days, we believe that the total cases

of typhoid fever occurring during August would be more closely approximated.

We observe that the first case of typhoid fever that appeared in this regiment was admitted on the seventeenth day after its arrival at Camp Alger, and that 2 other cases occurred on the eighteenth day of the occupancy of its new camp.

We also observe that the number of cases that occurred during the month of August (24) was unusually large for the first month of the epidemic. This can be attributed to the fact that Camp Alger, Va., was already an infected camp at the time of this regiment's arrival, and that the conditions were, therefore, favorable for the propagation of the disease.

On September 7 the regiment left Camp Alger for Niantic, Conn., where it arrived on September 8.

For this month, in an average strength of 48 officers and 1,318 enlisted men, there were 398 admissions to sick report, as follows:

Acute diarrhea	201
Malaria	64
Typhoid fever	63
All other causes	70

The following was the duration of the cases of diarrhea: One day, 107; two to three days, 59; four to five days, 27; nine days, 2; furloughed after three to four days, 6. Five cases admitted as acute diarrhea were changed after one to three days' treatment to the diagnosis of typhoid fever. A like change was made in 1 case furloughed as acute diarrhea. These 6 cases are included in the 63 cases reported by the surgeon.

Of the 64 cases diagnosed as malaria, 29 were returned to duty within twenty-four hours; after three to five days, 10; six to eight days, 2; ten to twelve days, 5; thirty-one to thirty-eight days, 3. Eleven cases were furloughed and returned to duty after periods varying from thirty to thirty-eight days. Three furloughed cases could not be traced. One case furloughed after two days' treatment died twenty-three days later.

There were, therefore, 63 cases of recognized typhoid fever during the month of September. To these we would add 1 case diagnosed as malaria, which died on the twenty-fifth day of treatment, and 3 other cases of malaria under treatment from thirty-one to thirty-eight days. By reference to the chart of this regiment for September it will be seen that 20 of the 63 cases occurred in Company K, 9 cases in Company I, 7 in M, while Company A had no cases and the other companies but few men attacked.

This again points to some other source than the common water supply.

It will also be seen that 16 cases occurred during the first week of September prior to departure from Camp Alger, and that 41 additional cases were admitted between September 8, the date of arrival at Camp Haven, Niantic, Conn., and September 22, when the men were

furloughed for a period of thirty days. These 57 cases can be justly considered as infections incurred at the Virginia encampment. This explanation, however, would hardly account for the 7 cases admitted during the latter part of September, and certainly not for 51 cases of typhoid fever admitted during the month of October, as shown by the chart.

The regiment having abandoned its infected camp site at Camp Alger, Va., we should rather have looked for a marked reduction in the number of cases occurring after the usual period of incubation had passed. On the contrary, we find 44 cases of typhoid fever admitted between October 1 and 14. Seeking an explanation of these additional infections, we believe that it may be found in the length of time during which the regiment occupied its camp site at Niantic, Conn., viz, two weeks, a period sufficiently long to allow new sources of infection to become established.

As bearing upon the slight prevalence of malarial diseases at Camp Alger, Va., we observe that of 101 cases of fever admitted from this regiment to the hospitals at Hartford and New Britain, Conn., September 8 to October 26, 98 received the diagnosis of typhoid fever and only 3 cases that of malaria. In the latter cases the diagnosis of malaria was based on the temperature curve and not upon blood examination.

This regiment was mustered out of service on the 1st day of November, 1898.

SUMMARY.

Mustered into service at Niantic, Conn., May 14, 1898.
Arrived at Camp Alger, Va., July 19, 1898.
Had no case of typhoid fever at State encampment.
Did not import typhoid fever into Virginia camp.
Date of first case of recognized typhoid fever after arrival at Camp Alger, August 5, 1898.

Typhoid fever in the First Connecticut Volunteer Infantry, by months.

	August.	September.	October.	Total.
Recognized cases.....	21	63	51	135
Probable cases.....	3	4	7
Total	24	67	51	142

Number of deaths from recognized typhoid fever 19
Per cent of mortality among recognized and probable cases
of typhoid fever..... 13.38
Left Camp Alger for Niantic, Conn., September 7, 1898.

TROOPS A AND C, NEW YORK VOLUNTEER CAVALRY.

Not brigaded; attached to Corps Headquarters.

[Medwin Leale, M. D., acting assistant surgeon, U. S. Army.]

REMARKS BY THE BOARD.

This squadron arrived at Camp Alger, Va., on May 23, 1898, and was placed in camp near the headquarters

of the Second Army Corps. Its water supply was obtained from a deep well located near the camp, and its fecal disposal was by means of open pits.

The mean strength of this command for the period May 22 to 31 was, officers, 6; enlisted men, 161. The admissions during this period were 5, namely:

Acute diarrhea	1
Typhoid fever.....	1
Injuries.....	3

The case of diarrhea was sent to duty at the end of two days.

The case of typhoid fever was admitted from Troop A on May 30, in the person of the captain commanding that troop. The diagnosis was confirmed at the general hospital at Fort Myer, so that this squadron imported 1 case of typhoid fever into its Virginia camp.

For the month of June, in a mean strength of 6 officers and 199 enlisted men, there were 88 admissions, namely:

Intestinal disorders.....	50
Remittent fever	3
Continued fever	2
Typhoid fever.....	4
Other causes	29

The surgeon remarks concerning the June report that the general health of the men has been good, but that they have been obliged to do a great deal of hard provost duty, and some of them have been debilitated in this way. He adds that there have been 3 cases of well-marked remittent fever; 4 cases of typhoid fever, and 3 cases of fever the nature of which has not been fully determined.

It appears that the surgeon laid down the following sanitary rules for the guidance of all concerned:

First. That all drinking water, other than Hygeia or Apollinaris, must first be boiled.

Second. That only boiled or other sterilized milk should be used.

Third. That ice will not be placed in drinking water, but used only for cooling the latter.

Fourth. The straw in the tents must be removed and burned every week.

He also remarks that in his opinion the cases of typhoid fever that occurred during June were contracted outside the camp.

Of the 50 intestinal disorders, 34 were returned to duty within 48 hours, 13 after three to five days, 1 case lasted nine days, 1 case lasted six days, and 1 was not traced.

The 3 cases of remittent fever lasted one, eight, and eighteen days, respectively.

The 2 cases diagnosed as continued fever were both changed to typhoid fever in the general hospital at Fort Meyer.

The diagnosis of the 4 cases of typhoid fever reported by the surgeon was confirmed.

These cases of typhoid fever, 6 in number, occurred as follows:

	Cases.
Troop A, June 1.....	1
A, June 24.....	1
A, June 28.....	1
C, June 25.....	1
C, June 29.....	2

The squadron having arrived on May 23, it would appear that the case reported from Troop A on June 1 was also probably an imported case.

The occurrence of 6 cases of typhoid fever in this small squadron of cavalry prior to the expiration of its first month at Camp Alger, Va., must be attributed to the chances for infection to which the members of this squadron were subjected during their various tours of provost duty in the surrounding country. We may add that the opportunity for infection within the camp, through the wise sanitary measures adopted by the squadron surgeon, were reduced to a minimum.

The squadron left Camp Alger, Va., for foreign service on July 23.

In a mean strength for this month of 6 officers and 200 enlisted men there were 21 admissions, namely:

Intestinal diseases	5
Remittent fever	4
Typhoid fever	1
All other causes	11

The cases of intestinal diseases were returned to duty within three days, except one case furloughed at the end of four days.

The cases of remittent fever were disposed of as follows: To duty after three days, 1; two days, 1; furloughed after two days, 1; furloughed after one day, 1.

The case reported as typhoid fever by the regimental surgeon was furloughed after one day. One case of typhoid fever, not reported by the regimental surgeon, was found in the general hospital at Fort Myer, Va.

The subsequent history of typhoid fever in this squadron during its service on the island of Porto Rico, from August to October, is of no particular importance, since the health of the command appears to have been very good during this time. Only 1 case of typhoid fever occurred during the month of August and 2 cases in September.

SUMMARY.

Mustered into service in May, 1898.
Arrived at Camp Alger, Va., May 23, 1898.
Had no case of typhoid fever at State encampment.
Imported 1 case of typhoid fever into Virginia camp and probably 1 other.
Date of first case of recognized typhoid fever after arrival at Camp Alger, June 24, 1898.

Typhoid fever in Troops A and C, New York Cavalry, by months.

Number of deaths from recognized typhoid fever	1
Per cent of mortality among recognized cases of typhoid fever	8.33

Left Camp Alger, Va., for service in Porto Rico, July 23, 1898.
Returned from Porto Rico in October, 1898.

GENERAL DISCUSSION OF TYPHOID FEVER IN THE FIRST DIVISION, SECOND ARMY CORPS.

A careful examination of the regimental histories, which have been given above at some length, serves to bring out a number of salient features.

In the first place it will be seen that some of the regiments in the First Division while yet in their State encampments had one or more cases of typhoid fever, and that the majority of these organizations upon their arrival at Camp Alger imported at least 1 case of this disease into the Virginia camp.

We will have occasion to point out more than once the probability in assembling 1,000 men in any part of the United States that typhoid fever will appear among them within the period of incubation after their rendezvous.

We find that the following regiments of the First Division, Second Army Corps, imported typhoid fever into the camp at Camp Alger:

	Cases.
Sixty-fifth New York.....	1
Seventh Ohio	1
Sixth Massachusetts	1
Sixth Illinois	1
Eighth Pennsylvania	1
Third Virginia	2

The following regiments imported no cases:

First New Jersey.
Eighth Ohio.
Twelfth Pennsylvania.
Thirteenth Pennsylvania.
First Connecticut.

We do not think that the importance of keeping before us this fact of the importation of typhoid fever by regimental organizations can be too much emphasized, since in a number of cases this early importation has been overlooked by the regimental medical officers and since this may serve as a focus of infection for other cases of this disease. As regards this division of the Second Army Corps, however, in the majority of instances the disease having been recognized by the regimental surgeon, the soldier was promptly transferred to the general hospital at Fort Myer, Va., a point remote from the camp.

Another point to which we desire to direct attention is the considerable time which elapsed between the arrival of the several regiments at Camp Alger and the occurrence of the first case of typhoid fever in these organizations. This is shown by the following table:

Regiment.	Date of arrival.	Date of occurrence of first case of typhoid fever at Camp Alger.
Sixty-fifth New York.....	May 20	June 15.
Seventh Ohio.....	May 21	June 14.
First New Jersey.....	May 21	July 2.
Sixth Massachusetts.....	May 22	June 16.
Sixth Illinois.....	May 21	June 20.
Eighth Ohio.....	May 19	July 12.
Eighth Pennsylvania.....	May 18	June 25.
Twelfth Pennsylvania.....	May 19	June 26.
Thirteenth Pennsylvania.....	May 19	June 20.
Third Virginia.....	June 5	June 22.
First Connecticut.....	July 19	August 5.

The Third Virginia Infantry and the First Connecticut Infantry developed their first case in a shorter time than the other regiments, which, in the case of the last-named regiment, is readily to be referred to the fact that this organization arrived at Camp Alger at a period when the camp was already thoroughly infected with typhoid fever.

Another fact worthy of notice is the small number of cases which are recorded for the period ending June 30, at which time nine of the regiments belonging to this division had been in camp an average of forty days. (The Third Virginia and First Connecticut, attached to this division, but not brigaded, did not arrive until June 5 and July 19, respectively.)

We find the distribution of the cases of typhoid fever for this period as follows:

	Cases.
Sixty-fifth New York.....	2
Seventh Ohio.....	1
First New Jersey.....	None.
Sixth Massachusetts.....	9
Sixth Illinois.....	2
Eighth Ohio.....	None.
Eighth Pennsylvania.....	2
Twelfth Pennsylvania.....	2
Thirteenth Pennsylvania.....	1
Third Virginia (imported 2 others).....	2

It will thus be seen that, with the exception of the Sixth Massachusetts, no regiment had more than 2 cases during this period. The latter regiment arrived on May 22; had its first case on June 2, followed by a second and third case on June 16 and 18. We note also that 4 of the 9 cases in this regiment were confined to Company H, and that six of the companies of this regiment had no cases up to the time of their departure from Camp Alger, July 5; so that this particular regiment is an exception to the rule. The explanation is not hard to find, since this regiment was constantly on provost duty from the time of its arrival at Camp Alger, and hence the men were subjected to additional danger of infection.

In order to show that the performance of provost duty gives better opportunity for typhoid infection,

we may cite the course of typhoid fever in Troops A and C of the New York Cavalry Squadron, which occupied an excellent camp site near corps headquarters. This organization, numbering 6 officers and 199 enlisted men, arrived at Camp Alger on May 23 and imported 2 cases of typhoid fever, 1 on May 30 and 1 on June 1, both of which cases were promptly transferred to the general hospital at Fort Myer. This organization was principally used for provost duty; and notwithstanding the fact that its water supply was derived from a deep well, or was imported, as Hygeia, Apollinaris, and such waters, and that the well water was boiled, we observe that 4 additional cases of typhoid fever appeared during the month of June, unquestionably due to duties which would call them away from camp and thus expose them to various sources of infection in the surrounding country.

When we take into consideration the nature of the water supply at this camp during the latter part of May and a considerable part of the month of June, and the chances for water pollution, we think it particularly surprising that so few cases of typhoid fever can be traced among this division, numbering more than 12,000 men. The same remark will apply still more forcibly to the Second Division of the Second Army Corps during this period. This, to our minds, points unmistakably to the absence of sources of infection at Camp Alger during this time, and indicates clearly that these were sporadic cases contracted by the men during their absence from the camp, in the city of Washington and vicinity.

Lieutenant-Colonel Smart, deputy surgeon-general, U. S. Army, under date of July 13, 1898, reports as follows:

These camps, notwithstanding their many unsanitary factors, are unusually free from disease. Vaccinia, measles, a few venereal cases from proximity to Washington, and some diarrheas from irregularities in diet or from chill after perspiration and the difficulty of attending to personal comfort in the crowded tents constitutes the sick list. In addition to these I found that since the camp was established, in May, 39 cases of typhoid fever had been reported and sent to hospital for treatment. * * * Four occurred during the month of May, 23 in June, and 12 up to the date of my inspection in July. Taking the month of June as the second month of the aggregation of troops, * * * and rating the strength at Camp Alger during that month as 20,000, the fever rate for the month would be 1.15 cases per 1,000 men.

As a matter of fact, Colonel Smart, relying upon the testimony of the regimental medical officers, reported fewer cases of typhoid fever up to July 13, 1898, than had actually occurred.

After the most careful search we have been able to trace up to the 30th of June, a period of about forty days since the establishment of the camp—excluding imported cases—21 cases of this disease among the regiments of the First Division and 11 cases among those constituting the Second Division; total, 32.

Basing the calculation upon the mean strength of the First Division for the month of June—namely, 11,137—

we find a percentage of 1.88 cases of typhoid fever per 1,000 men. Taking the mean strength of the Second Division for the month of June—namely, 11,257—we find a percentage of only 0.97 per 1,000 men. The percentage for both divisions for the period ending June 30 is 1.42 per 1,000 men.

If we take the period ending July 15, we find that 71 cases of recognized typhoid fever have occurred in the First Division and 32 cases in the Second Division, or a total of 103 cases, as against 39 cases reported by Colonel Smart for the period ending July 13, or a percentage of 4.06 per 1,000 men in a mean strength for both divisions of 25,341 men. The percentage for the First Division alone for this period, based upon the mean strength for July—viz, 13,135—is 5.40; and the percentage for the Second Division alone, also based on the mean strength for July—viz, 12,206—is 2.62 per 1,000 men.

It will thus be seen that typhoid fever had made but slight progress in both divisions of the Second Army Corps up to the period ending June 30, but that during the succeeding fifteen days, constituting the first half of July, the disease had slowly but steadily increased to the extent of 4.06 per 1,000 men.

Returning to the First Division, which, all things taken into consideration, was placed in less favorable circumstances than the Second Division, we observe that contamination of the general water supply at a period when this supply was most questionable and most subject to contamination, does not appear to have occurred, since we find that up to June 30, of the 110 company organizations, including 1 hospital corps company, constituting this division at that time, 92 companies had had no cases of typhoid fever, although the water supply was the same for all companies in each regiment. In other words, only 18 company organizations in this division had experienced cases of typhoid fever up to the 30th of June.

We desire to call attention, however, to the fact that notwithstanding the absence of contamination of the general water supply, the occurrence of 32 sporadic cases of typhoid fever among these 18 company organizations, constituting so many foci of infection internal to this division, was pregnant with meaning for the further spread of the disease. It was just at this time that a better, purer, and more abundant water supply had been obtained through the sinking of a bored well for each regiment; but notwithstanding this purer water supply, typhoid fever continued to increase. These wells were of the artesian class, and varied in depth from 47 feet to 156 feet, only 5 out of 40 wells being less than 60 feet in depth.

In boring for water a layer of very impervious clay of varying thickness was met with. Below this was found a layer of rock into which the hole was drilled until a satisfactory yield of water was secured. Simultaneously with the boring of the well a wrought-iron

pipe was driven downward by repeated falls of a heavy weight until, when rock was reached, a water-tight joint was made by driving the pipe until its cutting edge practically refused to go farther.

We can well believe the statement of Lieutenant-Colonel Lusk, chief engineer, to whom we are indebted for the foregoing information concerning the construction of these wells, when he states that, in his opinion, "these artesian wells were not subject to surface contamination owing to the method of constructing them, and the character of the strata through which they passed." He further adds: "The water supply in each case appeared to come from the extreme bottom of the well and to have no connection with the ordinary veins found at slight depths."

We may here state that following close upon our inspection of this division during the latter part of August, 1898, we subjected the samples of water from the wells of the Eighth, Twelfth, and Thirteenth Pennsylvania Infantry, of the Ninth Ohio Battalion, of the well at corps headquarters, and of the house well near the latter, to careful bacteriological examination, and were unable to isolate the colon bacillus from any of these sources, except in the case of the house well, which was practically an open well liable to contamination from air dust. These wells were all located in the old camps of the First Division, which were occupied until the beginning of August.

We also had careful bacteriological examinations made of the water from all the wells in the new camp of this division, and were able to isolate a micro-organism resembling the colon bacillus in two instances, namely, from the well of the First New Jersey and First Connecticut Infantry.

Notwithstanding the purity of the water supply, therefore, and contrary to the generally accepted opinion on the part of the medical profession, we find that typhoid fever, having been imported into various, although few, company organizations of this division, now steadily advanced; so that, as compared with the first fifteen days of July, when only 50 cases of typhoid fever were recorded for this division, we find during the second half of this month not less than 131 cases of this disease had occurred, and that the number of company organizations affected increased from 18 to 35 out of a total of 74 companies at that time constituting the First Division.

The escape from the occurrence of typhoid fever of more than one-half of the companies of this division (39) still points unmistakably to the absence of contamination of the general water supply.

The only exception to the freedom from water contamination is in the case of Company G, Twelfth Pennsylvania Volunteer Infantry. By reference to the individual history of this regiment above given, it will be seen that there is strong evidence pointing to the infection of the shallow well constructed by the men of

this company, owing to close proximity to the battalion privy. It will be further observed that the large number of cases occurring in this particular company strongly contrasts with the few that occurred in the companies of other regiments of this division.

At this period (July 31), when cases of typhoid fever had occurred in 47 per cent of the company organizations of the First Division, we find that notwithstanding change of camp sites made by the several regiments during the last few days of July or the first week in August, and in spite of much attention given to camp sanitation, the disease made steady and rapid progress during August as compared with the month of July. Thus, we find, in a mean strength of 9,464 for August, there occurred 326 cases of recognized typhoid fever in this division, or a percentage of 34.44 per 1,000 men.

If we turn to the course of this disease in the several brigades of this division, we find that the percentage per 1,000 men rises in the First Brigade—composed of the Sixty-fifth New York, Seventh Ohio, and First New Jersey—to 48.17; in the Third Brigade—composed of the Eighth, Twelfth, and Thirteenth Pennsylvania—to 32.63; while in the two regiments not brigaded, consisting of the Third Virginia and the First Connecticut, the percentage was 17.36 per 1,000 men. It will be recalled that from the well water of the last-mentioned regiment a bacillus was isolated which somewhat resembled the colon bacillus. (No calculation is made for the Second Brigade, as this had left for service in Porto Rico on the 5th of July.)

The highest rate of percentage per 1,000 men was attained in the case of the Sixty-fifth New York Infantry, in which, in a mean strength of 1,315 men for August, there were 123 cases of recognized typhoid fever, or a percentage of 93.53 per 1,000. This regiment therefore leads all of the regiments in the First Division as regards percentage of cases per 1,000 men.
